FOREWORD

SELLING THE CONTENTS OF THIS BOOK TO THE SALESMAN WHO IS CONSIDERING WHETHER HE WILL BE REPAID FOR THE EFFORT REQUIRED TO MASTER IT.

This book is intended for the person who is convinced that salesmanship is an honorable profession, rendering an important and difficult service. It is for those who have awakened to the fact that the salesman is not born ready made, with his powers fully developed.

The salesman must be made, in large part at least, by serious study. The efficient salesman must know the workings of, and have skill in influencing complicated and intangible mental processes, which determine the behaviour of men. It takes persistent hard work to gain an understanding of the factors and processes which determine the actions of men. The salesman's efficiency will vary directly with this understanding.

The scientific farmer, the teacher, the accountant, the lawyer, the engineer, the architect, the physician, the minister, and many others, have found it well worth their while to make a serious and careful preparation for the practice of their profession. The salesman will at last come to realize that intelli-

gent preparation for his work is quite as important, and will bring equally great reward.

The salesman can determine whether he is fully prepared for the practice of his profession by asking himself a few questions, and grading himself on his ability to answer them.

What is salesmanship? What does the approach aim to accomplish? What are the laws which govern the direction of attention to a thing, when it has once been secured? How is attention related to interest? What interests does the normal man have? Do you know to what interests your selling appeal should be directed? What is the relation between interest and desire? How would you undertake to arouse desire? When you have aroused desire, do you know how to carry it over into action? How can you tell when you have reached the "psychological moment" for attempting to close? How can a man think ahead and plan what he will say next, while his attention is adequately given to what he is saying? What are the best methods of learning, remembering, and thinking?

This book aims to give the salesman scientific knowledge which will enable him to answer satisfactorily the foregoing, and many other similar questions. Scientific knowledge is thorough and consistent. Methods guided by such knowledge are efficient in accomplishing the desired result. A scientific knowledge of mental processes enables the salesman to work intelligently and directly toward

the end he wishes to achieve, instead of resorting to the aimless and wasteful try, try again of the man whose knowledge is not equal to the demands of the situation.

The salesman ought not to be discouraged, or condemn this book, if he does not at once grasp the full significance or practical helpfulness of all it contains. Two or more thoughtful readings may be required to enable one to get the psychological point of view and master the method of the science. One has not mastered this discussion in a way that will make it of the greatest practical helpfulness until he understands clearly all the parts, and perceives their relations to each other and to the whole. He must learn to reassemble and to put to working harmoniously together the various processes that are here knocked down and taken apart for purposes of study.

The writer has tried long and earnestly to make this book elementary and practical. He is convinced that he could make it simpler only at the expense of making it more superficial. This would defeat the end aimed at in preparing it. The difficulty encountered in understanding and applying what is written here results mainly from the intangible nature of the subject matter and the lack of skill in exploring one's own mental processes. As one becomes skilled in the exploration of his own mind, the practical usefulness of the principles discussed here will become apparent.

INTRODUCTION

SALESMAN PERFORMS AN ECONOMIC FUNCTION

AS A FACTOR in the world of business the salesman is concerned with effecting a mutually advantageous exchange, in which money, or some other means of securing satisfaction, or some form of satisfaction, is received in return for the service, or serviceable thing sold. As the salesman performs an important business function, he should have some knowledge of business affairs.

The salesman must be master of his merchandise. He should have adequate knowledge of the materials, and mechanical and industrial processes employed in making the articles he sells. He must clearly perceive what the process of manufacture confers on the article, in giving to it qualities which make it have a commercial value superior to other things with which it may come into competition. It is generally recognized that it is important for the salesman to have knowledge of these things which may be called the material factors in salesmanship.

A man may be well informed in regard to the things previously mentioned and still be very poorly equipped in salesmanship. Additional factors which make for success, are knowledge of what to do in attempting to sell, and why it is done; also skill in

doing it. Skill may be developed best by practice in which one's efforts are guided by knowledge of the "what" and the "why." It is the purpose of this book to help to give a knowledge of the what to do, and why to do it.

PRACTICAL KNOWLEDGE AND SKILL

The art of selling may be acquired by blind imitation of other's methods of selling and by more or less haphazard methods of trial and error. The methods that fail are rejected and the methods that succeed are adopted, without knowing why they fail or succeed.

By this process one may gain considerable knowledge of what to do and may become skillful in doing it. But he will be able to apply this knowledge and skill only under the conditions in which he learned to apply them. They are not readily transferable and adaptable to a different situation.

Knowledge and skill acquired by the method of blind trial and error afford satisfactory guidance only in cases easily recognized as similar to those in which success has been achieved previously. One who has learned by this method will not be able to perceive the circumstances which alter cases. Even if he perceived them, he could adapt his knowledge and skill to the requirements of the altered circumstances, only by continuing the process of selecting the lucky hits from the misses.

Such a process of acquiring knowledge and skill

lacks the guiding light of intelligence. Even when one has gained practical success by this method he does not know why one attempt succeeded and the other failed.

One who has previously acquired the knowledge which enables him to understand the whys and wherefores of success will be able to go intelligently about the task of finding the right course of procedure under novel circumstances. If one has this kind of knowledge, when it occurs to him to try various lines of effort, he will be able to forecast more or less accurately the consequences of each line of action. He will thus be able to avoid much wasteful bungling.

The Theory of Salesmanship endeavors to bring into clear consciousness a knowledge of the *whats* and the *hows*, the *whys* and the *wherefores* of the art of selling. It aims to formulate general principles and to organize them into a system so that they will have the greatest practical usefulness in selling. It aims, not at a theory divorced from practice, but at a system of general principles which will furnish helpful guidance to the various practical activities of the salesman.

In this book the process of selling is carefully analyzed. A theory of salesmanship is developed so that the salesman can see the general principles which are to be applied in efficient selling. The salesman will master his art more quickly and will

become more expert in it by learning and applying these general principles.

The knowledge and skill which enable one to do a thing have a certain value. But unless one knows why he does the thing that way, he can not adapt his knowledge and skill to altered conditions which make it necessary to change the way of doing the thing. He can not adapt his knowledge and skill to doing other things.

One who knows why he does a thing in the way he does, and sees that the doing is a particular application of general principles, can do many other things which come under the same general principles. A knowledge of the general principles of selling makes one resourceful and adaptable.

The salesman who understands the general principles of salesmanship can instruct and direct others in selling. He has the sort of knowledge which helps the salesman to develop into a salesmanager.

SALESMANSHIP IS APPLIED PSYCHOLOGY

Why is it profitable for the salesman to study psychology? Salesmanship is an art. Though the salesman performs an economic function, the principles of his art are psychological. In the act of selling, the salesman deals directly with mental processes. Salesmanship is, essentially, applied general, individual, and social psychology.

Salesmanship is the ability to influence the mental processes of a person so that he will desire the serv-

ice, or the serviceable thing, offered to him and will perform the acts necessary to secure it. The art of selling involves applying to a special line of activity, under the conditions which govern there, the general principles which must be applied in any case in which one person seeks to influence the behaviour of another.

The art of salesmanship involves understanding of, and skill in influencing the mental processes which are the factors that determine the behaviour, or the actions, of the men with whom the salesman deals. The salesman must discover what interests of his prospective customers are concerned with what he intends to sell. What needs is it fitted to satisfy? What qualities of the thing to be sold fit it to satisfy these needs or interests?

The salesman must secure the attention of the man to whom he wishes to sell. By presenting suitable selling points, in the form of arguments or suggestions, the salesman must influence the mental processes of his customer so that he arouses a desire for the article and a conviction that the purchase should be made. He must not only see that the customer arrives at a favorable decision; he must also see that he definitely commits himself to the purchase.

Argument, suggestion, attention, interest, desire, conviction, and decision are mental processes. To clearly understand them one must study other

mental processes such as habit, memory, association, and thinking.

It must now be clear that in the act of selling the salesman is dealing directly with mental processes. The science which gives an understanding of mental processes is psychology. The salesman needs to know psychology in order that he may intelligently undertake to influence the mental processes and, through them, the actions of men. The master of the art of selling is the master of men. The salesman needs to know psychology as a means to the intelligent direction of his own life.

The general principles of the art of selling will be developed in Part I. This discussion will enable one to see what psychological processes are involved in selling, and how they are to be dealt with by the salesman. Parts II and III will give a clear understanding of the psychological processes with which the salesman has to deal. By means of illustrative examples, it will be made clear how a knowledge of these psychological processes will help to make one proficient in understanding and applying the general principles of salesmanship developed in Part I. It is obvious that much light should be thrown on Part I by reading it again, after Parts II and III have been mastered.

PART I

MAKING THE SALE

PREPARATION OF THE SALESMAN AND OF THE SELLING PLAN

This book aims to develop the general principles which underlie the art of selling. Special study is required to apply these principles in any special line of selling. Skill in the practice of the art must come from special study and carefully and intelligently directed practice.

The things one must do, in order to prepare to sell some particular thing, will vary considerably with the thing.

A detailed discussion of them would hardly be in order in a book which undertakes merely to develop and illustrate the practical application of psychological principles. It would be excluded on the ground that a work on general principles must not confine itself too closely to any particular line of selling. One who understands the principles should be able, by putting forth the necessary effort, to apply them to any special line.

PARTS OF THE SELLING PROCESS

In the complete selling process there is first of all the pre-approach. In the pre-approach one studies

the special needs and individual characteristics of his customer.

[In this discussion the term customer is used to denote the man to whom one is trying to sell. Strictly speaking, he may be no more than a prospective customer. Yet it is well to treat every man solicited as if he were a valued customer. The aim should not be merely to make a sale, but to make a customer. The sincere manifestation of this attitude has a suggestive force tending strongly toward making both the sale and the customer. The salesman, who has this attitude, will think of each man solicited as a customer. It will do no harm to call him so in our discussion.]

On the basis of the information gained, he formulates a proposition adapted to the customer's needs, and plans his approach and solicitation to close the circuit with the customer's interest. After this preparation has been made, the salesman undertakes the actual approach, in which he aims to secure attention to his proposition and an opportunity to present it.

If he is successful in his approach, he proceeds with the solicitation. During this solicitation he may display samples or make a demonstration of the article. The solicitation aims to stimulate desire for the article and to arouse an impulse to purchase it. As the salesman goes on with the solicitation he must dispose of any objections the customer may raise. He must skillfully diagnose the impression he is making on the customer's mind. He must feel

out the customer to see when he has reached the proper time to attempt to close. When the time is ripe, he must undertake to bring about the performance of the particular acts which the customer must perform in order to close the sale.

PRE-APPROACH

In selling a low-priced specialty, or article of general demand there may be little opportunity, or little need for the pre-approach.

The nature of the pre-approach may be made clear by the methods worked out for selling National Cash Registers. This pre-approach is divided into two processes, the investigation and the preparation.

The salesman is first instructed to make a note of things favorable to the success of the prospect's business. Among them are good goods, proper lighting, efficient clerks, desirable class of customers, etc.

The salesman should next investigate the method of doing business. He should find out the ways in which losses may occur. He may do this by observation, by conversation with the clerks, or even with the proprietor. To get the desired information from the proprietor it may be necessary to convince him of the importance of discussing his business with the salesman. In exceptional cases, by making a purchase, the salesman may secure information of much importance, which he could not get otherwise.

The investigation aims to give the salesman facts which will enable him to interest the merchant and show him why he can not afford to be without an up-to-date National Cash Register.

If the store is small, the preparation can be made

mentally, while the salesman is investigating. The investigation, the preparation, and the approach can all be made at the same visit.

If the store is large, the salesman should leave the store after his investigation and prepare a written analysis. For the largest stores this written analysis may be included in a written proposition. This proposition will give an explanation of the system proposed for installation, the location of the registers, etc.

The written analysis should list the good things found in the merchant's place of business. If the salesman unwittingly makes it appear to the merchant that he can see only bad things in the place and method of business, he puts the merchant in an antagonistic frame of mind. By recognizing and presenting the factors favorable to the success of the business, the salesman creates in the customer's mind an attitude which predisposes him to consider favorably the proposition presented to him.

The analysis should point out clearly how the system in use may be improved. It should show how the merchant lacks protection in the handling of his money, how he lacks sufficient information about his money, and why slow service exists.

The analysis should also give the cost of the proposed system. It may be well to compare the price with the cost of the system in use, or of some other system under consideration for adoption.

The written analysis, or proposition, may be used

in approaching the merchant to secure an appointment for a demonstration of the register. It should be thoroughly explained, and then turned over to the merchant and left with him.

The aim in the pre-approach is to enable the salesman to determine on a proposition, and formulate a plan of approach and solicitation. It enables him to present a proposition of such a sort, and in such a way, that the serviceability of what he proposes to sell will close the circuit with the customer's interest and needs. One can do this only as he understands the likes and dislikes of the customer, his point of view, his aims and ambitions, his financial resourses, the requirements of his business, etc.

With such information at his command, the salesman may make the aim of his appeal as definite as that of a rifleman shooting at a mark. Without such preparation the salesman must feel out the man he is soliciting by presenting more or less aimlessly a number of propositions and noting how they are received. His actions may be compared to a man shooting in the dark with a blunderbuss. With such a weapon it is more or less a matter of chance if any one of the missiles hits a vital point. When the projectile does strike the mark, it does not have much force, or penetration, or effectiveness.

The blunderbuss salesman reveals the fact that he is not master of his business. His random efforts make a bad impression which it is difficult to overcome.

Various firms employ persons other than sales-

men to make the investigation of the pre-approach. The New York Edison Company does so in planning to sell its service to displace that of private plants. A technically trained engineer makes a study of the plant to be displaced, as a basis for showing the advantage of using the central service. The data he gathers is then turned over to the salesman, who prepares it for use in the approach and solicitation. This plan is adopted because the engineer, as a result of his technical training, can do the investigating more efficiently than the salesman. The salesman can make better use of the engineer's data in the actual work of selling.

Some firms employ men, who work more cheaply than the expert salesman, to make the preliminary investigation, and locate prospects with whom it is desirable for the salesman to spend his time, and to furnish him with data to use in planning his proposition, approach, and appropriate solicitation. The problem as to whether the salesman, or some one else, is to make the pre-approach is a problem of marketing rather than of the psychology of salesmanship.

The pre-approach aims to adapt the general proposition to the needs and characteristics of the individual customer. It endeavors to gather data which will enable the salesman to formulate a proposition which will meet the real needs of the man to whom it is to be presented. It enables him to plan intelligently how to close the circuit with the customer's interests.

Sometimes an effort is made to prepare the man to be solicited, so that he will be favorably disposed toward the proposition of the salesman. Advertisements in periodicals, and papers, circulars, and letters can thus be used to pave the way for the approach and solicitation. The general principles of advertising and salesmanship must be employed in such an endeavor.

APPROACH AND SECURING ATTENTION

In his approach, the salesman aims to secure an opportunity to present his selling proposition to a prospective customer.

A correct approach means more than merely inducing a man to notice that you wish to sell him something. It involves getting him to lay aside other matters with which he may be occupied and to concentrate his thoughts on the proposition.

The approach is greatly facilitated by a prosperous appearance, attractive personality, pleasant voice, and courteous manners. What the salesman says and does should suggest that he has a forceful character, ability, assured and important position in the business world, geniality, humor, etc. His tactics should be based on a general understanding of human nature, and such knowledge of the customer as he could secure from others, or acquire by direct observation.

Every one is inclined to be inspired by a man who knows his proposition thoroughly, believes in it enthusiastically, and earnestly wishes others to know about it and to be benefited by it. If a salesman meets these requirements, he will have little difficulty in securing and holding the attention of men with whom it is worth while to spend his time.

Let us first consider the wrong way of going about it. Do not ask attention, as a favor, or say that you would like to secure attention for a little while. Never say "I wish to interest you in my proposition." Whenever the words "my proposition" are used they suggest that the salesman wishes to secure the attention for his own benefit. The salesman always should suggest that he is endeavoring to render a service to the customer. He will do this by manifesting a sincere belief in the serviceability of what he is endeavoring to sell.

Do not ask for attention. Attract it. Attention must not be attracted to the salesman, or by the salesman. Attention must be attracted to the selling proposition and by the selling proposition, if it is secured effectively. If the salesman can secure attention to a request for attention, he can secure attention to a statement or question about the proposition, aimed to arouse interest.

In dealing with business men, the salesman should never resort to cheap trickery indulged in by some canvassers, in order to gain admission to houses.

The introductory statement of the approach should be worked out as carefully as the heading of an advertisement. It performs a very similar function to that of the heading. It should make some statement about the proposition which will arouse interest in it and make it seem important enough to demand a thorough investigation. The best way to arouse interest in a proposition is to state definitely and clearly, but briefly, in what way the ac-

ceptance of the proposition will be of advantage to the customer. Awaken a foretaste of the satisfaction he will secure by making the purchase. Put the emphasis on the service the article will render. If necessary, support this with brief arguments or illustrations making clear the importance of the service. Show why he can not afford to refuse to investigate. Keep in your customer's mind what your proposition will contribute to the realization of his interests, if you can make your claims good. You can thus get him interested in seeing how and why the thing will do what you claim for it. A good approach will pass over naturally, and almost imperceptibly, into the solicitation.

If the salesman represents a business noted for the excellence of its products or merchandise, and for the efficiency of its selling force, he may attach some of this valuable prestige to himself, by bringing out clearly in introducing himself, that he is a representative of that business.

In his approach, a salesman of investment securities could well put emphasis on the large and certain dividends, the safety and convertibility of the investment, etc. The salesman of merchandise could dwell on the timeliness, style, quality, and price, which will make them sell rapidly and bring in large profit. The certainty of good business conditions in the near future will predispose a man to consider buying. When interest is aroused, the salesman should then present an article which he believes of-

fers a very attractive bargain, and proceed to make clear its attractive features.

If the conditions of selling are such that it is necessary to make an appointment to go with the man to some other place to see samples, or the demonstration of the article, it may be well for the salesman to be on hand at the appointed time to accompany him.

If a man meets the approach with the statement that he does not need the article, have ready an argument to show why he should reserve his decision until after he has investigated. If he says he is not interested, make it clear that you do not expect him to be interested until he appreciates the service the proposition will render him. The plea may be that he has no time to look into the matter. Remind him that the salesman's time is valuable to himself and his firm. The salesman could not afford to take time to talk to him unless he felt certain he had a proposition that would appeal to him as a business man.

If the customer is ill-natured, or in an antagonistic mood, make him forget it by talking about some subject he is interested in, outside your line of business. If you can not succeed in this arrange to call again.

Approach a man, if possible, when his energies are fresh, and his mind is free. If he is so occupied that he can not give you his full attention, make an appointment for a more favorable time.

The approach should arouse interest in the propo-

sition. If it fails to do this, the chance to sell is probably lost. Hence, the strongest and most attractive reason why the article should be bought, is not too good to use in the approach. The most successful fisherman is the one who uses the bait which attracts the fish most strongly, and displays it most temptingly. So the most successful salesman will be the one who, in his approach, presents the strongest selling points, in the most alluring way.

The reason why an article should be purchased, which may be used most effectively in the approach, as a means of attracting attention to the proposition and arousing interest in it, will generally have somewhat the form or substance of the general conclusion in regard to the desirability of the article, which the solicitation aims to establish.

Arousing interest merely means connecting the proposition with an already existing interest. The salesman can connect his proposition with an interest the customer already has, by showing him how it will contribute to the satisfaction of his need or desire, along the line of this interest. The salesman thus takes advantage of a tendency to desire already existing and stimulates and awakens it.

The following is quoted from the instructions given to the salesmen of a company operating a chain of cigar stores. It makes clear the spirit of courtesy every salesman should manifest toward those with whom he deals. The salesman who handles his customer tactfully does much to create good will for the store:

"Always—if there is no rush of trade—greet the customer when he comes in with a 'Good morning!' or 'Good evening!' or 'What can I do for you?'—or use any other polite phrase to welcome him.

"Call the customer by name, if you know it. A stranger should be asked to call again. 'I hope to see you again, sir,' and 'Don't forget us another time,' are good phrases to use. If you say the right thing the customer will surely think of you the next time he is in your neighborhood.

"After handing the customer his purchase and his change, say: 'Thank you, sir'; or, 'Much obliged'; or, 'Many thanks, Mr. So-and-So.' Two or three words of this kind must be said to let him know you appreciate the value of his patronage. Under our rules the customer who doesn't get thanked is cheated. Our customers go out saying: 'Nice chap, that!' "

"Get to know your customers by name. There is no need to ask a man what his name is, as though you were a police justice. You can say, after he makes his purchase: 'I'm glad to see you like that cigar, Mr. ——. Pardon me; but I know your face well and I'd like to know your name.' Then the next time he calls your 'Good morning, Mr. So-and-So!' will be a real welcome.

"Show everything you have in stock and suit your words to your actions. Give the critical customer a fair chance to make a choice without making him think you know better than he does.

"No matter what happens, unless forcibly at-

tacked never dispute with a customer. Let him talk as loud and as nastily as he likes. Keep your temper. Discuss the matter quietly. Swallow your anger. Cut out the rough stuff."

SOLICITATION

AIM OF THE SOLICITATION

To solicit means to seek earnestly with suggestions and arguments, with, or without, the assistance of a demonstration, to create a desire which will lead to the act of purchasing.

In the approach, the salesman has succeeded in attracting the attention of his customer to the proposition. He has made clear to the customer the service he proposes to render in satisfying his need or interest. He has aroused his interest by awakening in him a foretaste of the satisfaction to be secured by availing himself of the service.

The approach aims to create a desire for the service the thing will render. The solicitation aims to create desire for the thing, by creating the conviction or belief that it has qualities which make it a fit means of rendering the desired, satisfaction giving service.

The qualities which fit an object to render service are the characteristics, properties, or qualities, or features which give value to the object. What makes a thing serviceable we call, briefly, the value-giving qualities of the thing. They are the selling points of the thing.

The purpose of the demonstration, which will be discussed later, is to make clear why and how the

value-giving qualities fit the thing to render a desired service. These value-giving qualities are the talking points of the solicitation. They should be clearly and simply explained.

The talking points should be presented in the order most effective from the logical and emotional points of view. They should be so arranged that each leads naturally to the next. As far as the reasoning will permit, the points should be made in the order of increasing importance, so that the strongest will come last. If the points can not thus be arranged strictly in the order of a climax, each should be given prominence and emphasis according to its importance.

Talk quality first and then price. Quality includes all the properties, characteristics, or features which give the article commercial value. Quality, embraces all that makes the article desirable in material, construction, and design.

When a man has been convinced of the desirability of the article, he can be led to see that the satisfaction to be gained is commensurate with the expenditure involved, and that the price is therefore reasonable. Hence, price is a secondary consideration. It should not be mentioned until the demonstration of quality is complete enough to make it appear that the price is reasonable.

No matter how high the price may seem, the salesman should be ready to show that it is really low in comparison with the service the goods will give. It is, perhaps, hardly necessary to state that when

goods are being sold for resale, the service the purchaser is to derive, is not to be measured wholly by the margin of profit on each thing resold. The ease of selling made possible by an attractive appearance, or package, the qualities which tend to make a regular purchaser out of the casual buyer, and other things, add to serviceableness. Judged on the broad basis of serviceability an apparently high price may be lower than the smaller price of an inferior article.

If the price is asked before the salesman is ready to give it, he should say that he will come to that pretty soon. The price quoted will seem low, when the merit of the goods has been made clear.

The self-confidence of the salesman adds much to the effectiveness of the solicitation. He should appear confident of making the sale, but of course should avoid over-confidence, or presumptuousness.

The confidence which begets confidence in the customer, through suggestion, comes largely from an honest conviction that the sale will be of real service to the buyer, and from a consciousness of being fully prepared to grapple with the situation.

To avoid the embarrassment and fear of failure which destroys confidence, the salesman should have thoroughly mastered what he wishes to say and do in his solicitation. He can then concentrate his attention so completely on the things he is doing that there will be no place in his thoughts for paralyzing feelings of embarrassment, diffidence, doubt, or fear of failure.

It is folly to commit to memory a selling talk worked out by some one else, and to give it slavishly word for word. One is likely to give such a talk with much the effect of a little child saying his piece. A talk, so committed and used, is so stereotyped that it can not be adapted to the changing needs of the solicitation.

The selling talk, down to the smallest details of expression, should be carefully thought out in words. It may well be written out. Each argument used in making a point, or in meeting an objection, should be thoroughly mastered so that one will never be at a loss for what to say, or how to say it. To accomplish this do not depend on memorizing by rote.

Fix upon the germinal or central thought of each argument, from which you may think it out again, or redevelop it, when you wish to use it. This germinal thought, or central idea, will be the general topic of the selling point, or the answer to the objection. Express this general topic in the form of a suggestive phrase, or brief sentence, which will serve as a cue to recall the argument in detailed form when the circumstances are seen to demand its use. For example: this is the "prevents loss," or "reduces expenses" argument, or the answer to the "I want to look elsewhere" objection. If the carefully worked out details of the exposition, or argument, are thoroughly associated with the topic in the order in which they should be recalled, one will always have at his command, ready to use effectively, all that bears on the topic. When what is said

springs from such preparation, it comes with all the adaptability, spontaneity, and stimulating effectiveness of extempore speech.

When the various selling points have been carefully worked out and tagged with appropriate cues, the cues should be firmly associated in memory in the order in which they are to be used. Make the association links established between the various cues, in order to recall them, intelligible or logical, when possible.

The salesman should have the part his selling point is fitted to perform in making the sale firmly associated with its cue of recall. He will then be able to perceive when the situation developed in the solicitation makes it desirable to use a certain argument or exposition and can readily recall it. He should have mastered it so thoroughly that he can give it without much demand on his attention.

While making the point thus mastered, he can think ahead and plan to meet any unforeseen circumstances, which may make it necessary to change his tactics. When such circumstances are encountered, if one is properly prepared, he will recognize their significance. This recognition will bring into the margin of consciousness the cue of the argument he has worked out to meet this situation.

The situation unexpectedly encountered may be one not fully prepared for in advance. In that case he may find several thoughts starting to develop in the fringe of his consciousness. From these he can select the one which seems best adapted to meet the

situation. His many-sided preparation has given him resourcefulness.

STATING THE AIM IN TAKING UP A NEW POINT

The discussion of each new selling point taken up during the solicitation should begin with a statement of what is aimed at in developing the point. It is well to have in the customer's view from the first, the conclusion to be reached from the facts or value-giving qualities presented. A selling point may be regarded as a conclusion in regard to the value of a thing, to be established by reasoning from the value-giving qualities of the thing.

To prevent the customer's mind from wandering, the salesman should develop his subject in a natural and logical order, as rapidly as the full import of the points can be grasped. If the man's mind is not fully occupied in following the visual demonstration and verbal presentation, it may switch to some other line of thought. If the thoughts once get to running freely along some other line, the sale may be lost. At least some efforts have not been effective, and some of the work will have to be done over. Hence, to hold a man's attention, it is necessary to keep new aspects of the problem developing continually. During the solicitation the salesman should dominate the trend of his customer's thoughts.

The salesman should not permit himself to be drawn into conversation about irrelevant matters, while talking the sale. In such a discussion the effect of what has already been said will be lost. An

antagonistic attitude may also be aroused. Conversation about general topics should be had before or afterwards, if at all.

PUTTING THE MAIN POINTS IN WRITING

If a selling talk is long and complex, it may be well to write down each important selling point in plain view of the customer, and then proceed to develop it. The customer then sees at the start the point which is aimed at. The writing, in plain view, enables him to keep the general aim in mind and to more fully appreciate the bearing of what is said, as the solicitation proceeds.

With many customers the appeal through the eye is stronger than the appeal through the ear. The impression made through two senses is stronger than if made through either alone.

The attention is instinctively directed to movement or action. The observer experiences a strong curiosity to see what will be written. This impresses the writing clearly on the mind.

The points thus written down have a long time in which to impress themselves on the mind. They may be given additional emphasis by referring to them from time to time as the discussion proceeds. The written points will be convenient for making the final summary, when the time for closing is reached.

The customer feels different about a claim to serviceability when it is put down in "black and white". Such a claim can be verified. It must be fulfilled. It

commits the salesman to make good in a very definite way. Oral statements are frequently discounted considerably. A written statement can be taken to mean just what it says. Making a permanent record of a claim to serviceability is an evidence of sincerity and good will. The service afforded will be compared with the claims. The claims must be truthful.

The salesman who uses this device combines the simple, condensed form in which the advertisement sets forth the selling points of the article, with the adaptability and warmth of a personal appeal charged with enthusiasm. The salesman should study the principles of advertising in order to use this device successfully.

ADAPTING THE SOLICITATION TO THE CUSTOMER'S MIND

The customer can assimilate, or properly appreciate the bearing or significance of what is said in the selling talk, only by relating it to kindred knowledge he has gained through education and experience. The salesman must present his subject from the customer's point of view, and build on the foundation of knowledge already present in his mind. However, he must proceed to elaborate, enrich and transform this knowledge.

The genius of the salesman is manifested largely in the certainty and readiness with which he hits on the right interest and ideas in his customer's experience to use as an assimilating notion, or apperceptive mass, to which he can effectively connect, by rational links, the points he wishes to make. He must make clear the relations existing between the customer's interests, experience and knowledge and the new matter he presents, pertaining to the thing he is selling.

The salesman's ability to transmit to his customer his own conviction and enthusiasm, depends on his skill in building up in the latter a state of mind similar to his own. To accomplish this, the salesman depends upon exposition, argument, demonstration, and suggestion. The ideas which the salesman

presents tend to arouse in the customer's mind feelings similar to those which accompany them in his own mind. The enthusiasm and confidence manifested in the bearing, expression and talk of the salesman tend to arouse, through suggestion, a similar state in the mind of the man he is soliciting.

The salesman must not be contented with making mere general statements about his article. All such statements should be founded upon a broad basis of facts, or illustrative examples fitting in with the actual business experience and methods of the customer. A generalization is effective only when it is seen to be a conclusion drawn necessarily from an adequate foundation of facts. Such a generalization is full of significance and is dynamic.

EFFECTIVENESS CUMULATIVE

Thoughts, feelings, and volitions are controlled not merely by the idea in the focus of consciousness. All the elements in the dim background of consciousness, or that have been recently in consciousness, contribute their part in directing the mind's activities.

A well-developed solicitation sets to work a number of processes all directing their influence convergingly along one line, and all co-operating to bring about the desired act of closing. Each point made leaves behind it a trace of brain and mind activity, and a favorable emotional coloring. These persist as important factors determining largely the trend in the complex changing state of mind developing as a result of the selling talk.

Each point the salesman has made remains potent and effective while he is developing subsequent points. He thus builds up a constellation of marginal traces of previously made points, and of desire previously aroused. The effect of the appeal is cumulative. The persisting influence of the previous mental processes tends to fill the mind with a well-grounded belief that the purchase should be made. This influence also tends to prevent ideas of acting contrary to that belief from getting into the mind.

A properly worked-out selling talk can thus be

made cumulative in its effect. In a final skillfully arranged summary the salesman can stimulate to greater activity the persisting traces of previously made points, and direct their united force on the act of closing the sale.

In the act of closing, the customer's attention should be centered, not on the value-giving features, but on the act of closing. This will be developed more fully later on.

BRIEF SOLICITATION FIRST

In selling things which do not require a complicated demonstration or argument to make clear the service they offer it is well to make first a strong, but rather brief, presentation of the main selling points. Considerable material is held in reserve for future use, if the first attempt does not succeed. The first, determined, brief presentation may close the sale. In that case, to have used a longer talk might have lost it. At least, time and energy would have been wasted.

After making such a brief solicitation the salesman should sound his man to find whether he is ready to close. The methods of doing so will be discussed later. By thus feeling out the customer the salesman can find out what objections he will have to overcome. He will perceive along what line further appeal may be most effectively undertaken. He will discern whether he should aim to strengthen existing desire, or to awaken new desire, or whether

effort should be concentrated mainly on showing that the thing is best fitted to satisfy existing desire, or that now is the time to get it, or that the purchase will not involve too great a sacrifice of other interests.

RENEWAL OF THE SOLICITATION

If the salesman's first brief attempt is not successful, he should return again to the solicitation, profiting by the enlightenment gained. If he has written down the main points of his preliminary solicitation he should see that they are kept clearly in mind. As he brings into play material previously held in reserve, he should indicate its bearing on the main argument previously presented. He should finally summarize his argument in a form more condensed than his first brief presentation.

Price should not be mentioned until near the close of the solicitation, as the customer may center his attention on price when the salesman wishes to direct it to quality.

Incongruous, irrelevant, or frivolous matter should not be injected into the selling talk. A pause to let a point soak in should not be long enough to allow the customer's mind to get running along another line of thought. Tactics should not be changed too abruptly.

If the solicitation is interrupted at any point, continuity is likely to be lacking when the solicitation is begun again. When the solicitation is resumed,

the part gone over previously to the interruption should be reviewed briefly so that it will be present in mind in such form that the rest of the talk will connect with it properly.

TRUTH

To gain the greatest permanent success, a salesman should make it clear that his desire is to render such service to the purchaser that he will become a regular patron. The salesman selling to a merchant should know what style and quality of goods and what amount can be used most profitably by any particular customer and should give him the benefit of his knowledge. The seller should be fair, candid, and honest in his statements and honorable in his methods. He should guard carefully against making the impression that his chief concern is to make the sale, regardless of the interests of the purchaser.

A common practice among retail salesmen is to look closely for suggestions from the customer and to sell him whatever he may take a fancy to, even when he knows it would be better for him to buy another article. A better practice would be to give him honest and expert advice, so that his purchase would be permanently satisfactory. His good will and future patronage would thus be secured.

To illustrate this point, suppose a woman takes a fancy to goods that will fade in washing. If the salesman knows that a permanent color is required for the use to which she intends to put it, he should tell her that the color in question will fade. By so doing he may lose the sale. This would be better

than to have the purchaser feel that the store had sold her a gold brick, and mistrust it in the future. It is better to lose a sale than to lose a customer, or to create ill will.*

It is wise to appeal to the good judgment and intelligence of the purchaser. Such an appeal is pleasing to the one to whom it is made. Every one believes he is intelligent, and has good judgment. He is flattered when others see it and admit it. Such recognition and admission establish a relation of equality and confidence between salesman and purchaser. Frequently the customer will feel that the reason presented must be a good one, though he can not fully comprehend the significance of it.

*See the discussion of "Good Will" in the author's "Psychology for Business Efficiency."

DEMONSTRATION

What one sees in an object is determined largely by the interests dominant in his mind, and by his preconceptions, or misconceptions. Experiment has shown that one may fail to see very important and significant features in plain view. He may distort what is seen, or believe he has seen what is not there. He may fail badly to apprehend the correlations and significance of the qualities of which he becomes aware.

In order that a customer may get the right understanding of a thing, his observations should be guided and directed by the salesman. The salesman must see that he brings the right ideas to bear in interpreting the observations made. The demonstration aims to accomplish these things.

The demonstration appeals to the strong instinctive interest in observing what others are doing, and to the instinctive curiosity to know the significance of it. Seeing a thing done is much more interesting and full of meaning than hearing someone tell how it is done. Doing it one's self arouses still greater interest in it.

In selling many articles, the demonstration is a very important part of the solicitation. Its purpose is to make clear what value-giving qualities the thing has, and to show how and why they give it

value. It should be accompanied by a verbal exposition of the points of value in the thing and an explanation of the service they render. The solicitation supplements the demonstration with arguments and suggestions aimed to induce the customer to perform the acts necessary to secure the service.

The exposition aims to make one see the value-giving qualities of a thing, their functional interrelation, and how the customer's needs and interests are concerned with the service the thing is fitted to render.

In making the demonstration, one should not fall into the common error of assuming that because the customer's eye receives a retinal image of the thing, he therefore really sees how the qualities of the thing make it fitted to render service.

Seeing, in the sense in which the salesman wishes his customer to see the sample or article demonstrated, is a complex mental process. It involves a clear discrimination and a correct apprehension of the various value-giving qualities and their interrelations, and of the fitness of the thing as a whole to serve as a means of securing satisfaction. This can be accomplished only as the observations are properly guided or directed by the salesman. He must see that the right interest is aroused, and the right ideas are brought to bear in interpreting what is seen.

In making a demonstration, it is never safe to assume that any essential feature will be seen and

rightly understood, merely because it is plainly in view. Neither is it safe to assume that the significance of a thing will be present effectively in mind, merely because it must have been apprehended previously. Familiarity breeds indifference. All essential features, no matter how familiar they are, must be pointed out clearly in the demonstration. Their significance should be brought vividly into consciousness. Many things do not become at all clear until they are presented visually.

In demonstrating a cash register the salesman is not content with pointing out that the indicator shows the amount of each purchase. He makes clear how the indicator gives publicity to the amount, and how publicity enforces honesty. He dwells strongly on how the total sales check up with the amount shown on the recorder, and how this reveals dishonesty or error. He also brings out many other serviceable features in a similar way.

AROUSING IRRELEVANT IMPULSES TO ADD FORCE TO THE DESIRE FOR THE SERVICE OFFERED

The salesman sometimes strengthens the impulse to buy by arousing irrelevant impulses to re-enforce it. The practice is generally questionable, and often deserves strong condemnation.

In olden times the auctioneer began by offering his article at a high price, which he gradually lowered until the sale was made. A similar device is sometimes employed in window displays, in which an article is offered at a price which is to be lowered a certain amount each day until the thing is sold.

In modern times the auctioneer agrees to accept a low price if he can not succeed in his endeavor to get a better offer. The modern practice is more successful than the ancient one, because it affords the auctioneer an opportunity to arouse a spirit of rivalry. He starts competition. He awakens the fighting spirit. A man who is bidding in competition with others may often be induced to pay considerably more than he would offer at private sale. The fact that some one has offered a certain price tends to make others believe that it is worth more than that price. In this way the desire to buy is re-enforced with impulses which could not be aroused by a mere

setting forth of the value-giving qualities of the article.

A salesman working for an unknown insurance company had to spend so much time and effort explaining about his company that his efforts devoted to the sale of insurance had but little effect. He had to sell the company before he could sell insurance. When confidence and good will for a line already exist, they strongly predispose one to respond favorably to the solicitation. Whatever creates good will for the business re-enforces the solicitation. See "Good Will" in "Psychology of Advertising."

ILLEGITIMATE MEANS

Some salesmen endeavor to gain the good will of their customers by entertaining them at dinners, or shows, or ball games, etc. Such means may predispose some men to buy. However, they are irrelevant to the end in view and their use is more than questionable. It is but a short step from such persuaders to open bribery which, of course, puts the salesman beyond the pale.

Some salesmen come to rely on making concessions to the buyer, rather than on forceful solicitation in which the value-giving qualities of the article are presented effectively. By so doing, they reveal a great weakness, either in themselves, or in the line they are selling.

The possession of a large, powerful body suggests that the man has corresponding strength of character and ability. Such a person towers above his fellow-men. They tend to look up to him, literally and figuratively. He has prestige because of his size.

A big man loses much of his size prestige, if a little man with whom he is dealing is placed above him. Regardless of the relative size of the men, the salesman loses prestige in dealing with a customer, if he sits or stands so that the customer looks down upon him. If the salesman can not be seated so that his eyes will be above, or at least on a level with, his customer's, he should stand.

The salesman should not lounge or slouch. He should sit or stand in an erect and alert attitude.

The salesman must be able to meet the gaze of his customer frankly and unwaveringly. A shifting gaze and embarrassed attitude are manifestations of self-distrust and self-submission in the salesman. They are a confession of weakness.

The salesman's gaze, expression, and bearing should show self-assertion and self-reliance springing from reasonable confidence in himself and in his proposition. The salesman's manifested confidence, enthusiasm, and mastery of the situation, tend strongly, through suggestion, to arouse confidence,

enthusiasm, and self-subjection in the customer.

Selling is an important and serious business. The salesman should make his statements seriously and earnestly. His seriousness should not be grouchy or funereal. It should be good-humored and optimistic, but without the spirit of fun or levity.

The man who makes a serious statement and then giggles or laughs about it, destroys its effectiveness. Through suggestion he arouses an emotion in the mind of the customer which prevents him from taking the statement seriously and realizing its importance.

The salesman can get some hints for the effective presentation of his selling talk from manuals on public speaking and from teachers of the subject, and from studying good speakers to see what makes them effective.

Many factors contribute to effectiveness. Among them are clear perception of what one wishes to accomplish and an understanding of what ideas one should choose to accomplish it; the clear expression of these ideas in words and the arrangement of the words with due regard to logical sequence and emotional strength. Contributing to making these effective, are tone of voice, manner of speaking, gestures of head, hand, or body, expression of the face, attractive personality and the glow of honesty, earnestness, conviction, sympathy, confidence and enthusiasm manifesting itself by suggestion, in subtle ways, in the presentation of the selling talk.

The principles of argumentative exposition, of persuasion, and of rhetorical effectiveness, should be applied in arranging and presenting talking points. The persuasive presentation of the selling talk requires a personality and ability kindred to that of the successful orator or advocate. Knowing what to say and do is only half the battle. Half of its effectiveness depends on how it is said and done.

The salesman must secure conviction by well-reasoned proof, but he must not content himself with an unemotional assent to a chain of reasoning. He must arouse the feeling which will lead to action. The persuasiveness of his talk, as indicated before, will depend on what he says, on the logical and rhetorical effectiveness with which he says it, and on his personality and manner of delivery.

The salesman's argument is in the center of consciousness, but all the other factors previously mentioned help to build up around it, by suggestion, a fringe of emotional and impulsive elements which add greatly to its effectiveness, and prevent the occurrence of opposing ideas. Two salesmen may make pleas equally conclusive as far as their logical character is concerned. One may meet with mere intellectual assent. The other, through his emotional appeal, may arouse to decisive action. Hence, logical adequacy of subject matter must be supplemented by the other factors contributing to effectiveness.

We are not advocating overloaded attempts at fine

speaking. Buncombe, or frothy eloquence, will not fill the bill. What is needed is simple, straightforward talk, clearly expressed, and supercharged with the feeling which comes from the sincere and strong conviction of the salesman.

Business men are not carried away by mere plausibility. Build clearly the foundation of facts from which you wish your customer to draw his inferences. It is not sufficient to present good points. The solicitation must close the circuit of what is said with the interest already existing in the customer's mind. The proposition must be connected vitally and naturally with the experience and aims of the customer.

Secure emphasis by approaching the thing from a different viewpoint, and by expressing it differently, as well as by using strong words, or by repetition in the same words, or by emphatic delivery.

Strong speaking does not require big words. Big, strong ideas expressed in simple words and easily understood sentences are what is needed. Over 2000 years ago Tiberius Gracchus said: "The wild animals of Italy have their dens and lairs. The men who have fought for Italy have air and light, nothing more. They are called masters of the world, though they have not a clod of earth they can call their own." Men who can conceive and express strong appeals to interest in simple form like that do most to move the world. They move the world

because they make a direct and easily comprehended appeal to the universal interests which grip the hearts of men.

Of course, when one is talking about a scientific subject to men of expert knowledge, he must use technical terms. Ordinary words are generally too vague, indefinite and ill defined in meaning, to meet the demands of exact explanation under such circumstances. Big words which express big ideas are all right in their place. Men versed in science are repelled by an attempt to express its ideas in the loose and poorly defined words of ordinary speech. Each new idea in science demands that a new technical term be coined for it, or that an old term be used in a new and definitely defined meaning.

Spencer sought to establish that "Evolution is the transition from an incoherent, indeterminate homogeneity to a coherent determinate heterogeneity, through a process of differentiation and integration." Some men have held this definition up to ridicule on account of its technical difficulties. But it set forth Spencer's idea in a form which was highly satisfactory to the class of readers to which it was addressed. Hence, it was used with appropriateness and good effect.

One should use technical terms when he wishes to sell scientific apparatus, or complicated machines to technically trained men. One should not hesitate to use scientific terms when addressing men well in-

formed on the subject. One should not be repelled by technical terms or treatment when he is trying to master the exact knowledge of a technical subject, such as psychology. Such a subject can be adequately presented only by using such terms.

The salesman should not present his selling talk in the form of a challenge for a debate. He should not argue with his prospect, or flatly contradict him. Avoid destroying confidence by too strong statements or by running down a competitor.

DIAGNOSIS

When a salesman is presenting a business proposition to a man, he tries to understand his thoughts, feelings, mental attitudes, and prejudices. He endeavors to estimate their influence as factors in determining whether the proposition will be accepted. He tries to diagnose the mental state of the man.

There is no science which will enable a salesman to predict how any particular man will think, feel, and act in regard to his proposition. Acquaintance with the individual, alone, will give that power. The minds of all men work according to the same laws. The salesman is interested in getting men to do certain things by influencing their minds. Through knowledge of psychological laws he will gain insight into their minds and skill in convincing and persuading them.

A knowledge of psychological laws will assist the salesman, as he proceeds, to estimate the effect his course is having. Such knowledge will help him to steer clear of obstacles, and to tell when he has worked his man up to such a point that he is warranted in pushing the matter to a definite conclusion. Knowledge of psychology, alone, will not enable a man to do this; such knowledge must be supplemented by a thorough understanding of many types of individual character.

Insight into the minds of men may be increased by studying sociology, political economy, political science, history, literature, etc., or by anything that increases one's general knowledge and culture. But skill in reading character and in correctly apprehending a customer's state of mind must come largely through a wide acquaintance and intimate association with men of all classes. One learns to deal with men through actual experience in dealing with them. A knowledge of the laws to which mental processes conform enables one to profit more by this experience. It enables him to perceive the significance of what he sees.

If one has the right sort of natural ability, a knowledge of psychological principles supplemented by wide experience with men, clarified through painstaking effort to rightly profit by it, may develop in him a judgment so accurate and prompt in sizing men up that it may be said to be intuitive. What is known by intuition is perceived directly and with certainty, without the necessity of going through long or complicated processes of thought. Such intuitive judgment is based on certain things actually observed in the expression, bearing, acts, or conversation of the person to whom it applies. We may not be able to tell clearly on what such judgment is based. Such is often the case when we say to ourselves, in regard to a man we have just met for the first time, this man is honest, selfish, or generous. Generally we would be very much at a

loss if we attempted to justify to ourselves, or to others, such judgments in which we confidently believe.

When we thus say we like, or dislike, or suspect, or trust a person on first sight, or say that we believe he is stingy, or generous, or honest, or dishonest, or conceited, or stubborn, or what not, our judgment may be based on some undefined characteristic, observed, but not clearly discriminated, from the other elements of the general impression. We vaguely recognize a characteristic which has been an element in some personality which experience has shown to have the traits we attribue to the person now under consideration.

Just as doubt or conviction in your own mind will manifest itself in modifying your action, so will duplicity, knavery, uncertainty, desire, conviction, etc., manifest or express themselves unconsciously in the attitude, acts, countenance, or tone of voice of the person in whom they are found. Such expressions are the things on which our so-called intuitive judgments are based. Instinctive capacity and capability developed by experience are both factors which contribute to this ability.

Such judgment, based on what is observed in the ordinary ways of expression, must not be confused with telepathy, mind reading, or thought transference as it is variously called. It is generally agreed among psychologists that telepathic communication is an established fact. It is also agreed that it is so

rare and undependable in its manifestations that it offers no help to the salesman.

It is not difficult to understand the parts of psychology with which the salesman is most concerned, the difficulty comes in making the principles practically helpful. When what has passed through the mind is reviewed it may be seen that the activities have conformed to psychological principles. We can generally say why any particular state has followed the previous state. Psychological hindsight is comparatively clear and certain, but psychological foresight is far less easy. For example, what is present in a man's mind will be followed by some idea previously associated with it, or resembling it; but this does not enable one to tell what particular associative connection or resemblance will prove effective in suggesting the idea which is to follow. Psychology gives the laws in accordance with which ideas, feelings and volitions occur in the mind, but does not enable one to foretell with certainty what particular mental states will occur.

Psychology teaches the "how" of the mind's working. It enables the salesman to do, with more or less certainty and assurance, what he would otherwise undertake blindly. Experience, guided by a knowledge of how the mind works and by an understanding of the principles of salesmanship, enables the salesman to undertake intelligently the task of starting with a given content in the mind of the customer, and influencing his thoughts and feelings

in such a way that he is ready to close the deal.

The psychologist's attitude is abstract and analytical: the salesman's is concrete and practical. In a sense, the attitudes conflict and it is rather difficult to combine them successfully in one mind. Psychology is a science, salesmanship is an art. The relation of psychology to salesmanship is much closer, but it resembles somewhat the relation of biology and chemistry to medicine. It takes acumen, ingenuity, and practical ability to make original, successful applications of such fundamental sciences to the development of the art. But after the applications have once been made, many who could not have made them, may profit greatly by applying them in their practice.

Successful salesmanship will conform to the laws of psychology, whether the salesman has learned them from the study of the science at first hand, or from studying the applications of psychological principles made by others, or whether his observation and experience have brought him to conform to these laws without definitely formulating them. A knowledge of psychology should prove helpful in developing the best methods of salesmanship.

Since understanding the man as an individual is very important, the salesman will often secure helpful knowledge by trying before soliciting him, to find out in the pre-approach, something about his methods of doing business, his strong and weak points, and even his interests, outside his business

lines. Frequently it will be impossible to get any helpful knowledge of this sort. The salesman must then depend on carefully observing the man while making his approach, and while soliciting him. Perhaps, if the man is not too pressed for time, he can engage him in conversation for a few moments, and feel him out in a general way before he gets down to business. He can thus combine the pre-approach with the approach.

The man to whom the selling appeal is made is generally on the defensive and tries to keep the salesman from perceiving what he really thinks and feels about the proposition. Since the salesman's efficiency will increase as his insight into the contents and workings of men's minds increases, he should avail himself of every resource that will be of assistance in penetrating this defense and discerning what is really taking place in the man's mind. He must not merely understand the laws in accordance with which the minds of men work, he must be able to comprehend the ideas, notions, interests, prejudices, likes, dislikes, beliefs and impulses of the customer as they manifest themselves in his mind during the solicitation. He must discern his customer's wants, what he knows, and does not know about the thing offered for sale, and how he can be most effectively influenced. Such are the things which will determine how the customer responds to what the salesman says and does.

The salesman must size up his man early in the

game and see clearly, and be guided by, the effect he is making. As the solicitation proceeds he must judge of the progress he is making by noticing carefully what the customer says, and does not say, his tone of voice, the expression of his eyes, and countenance, and his actions. Of course, the salesman can not be guided by what the customer says, unless he allows, or even encourages him to talk. Success in interpreting these manifestations depends not merely upon familiarity with psychological laws, but upon tact, intuition, insight, and ability to read individual character coming from a wide acquaintance and experience with men.

Ingenuity and resourcefulness, a forceful and pleasing personality, wise aggressiveness, and ability to inspire confidence in one's self and in what one is selling are essential to great success. The salesman should be a complete master of his line, not only in all its details, but in its general bearings as an economic force and in its relations to other affairs. When he is thus equipped and has the ability to diagnose the effect he is producing, he can select talking points adapted to the man with whom he is dealing, arrange them effectively and present them with telling force.

While proceeding with his selling talk the salesman may often find out what effect he is making by asking appropriate questions worded so as to suggest assent to them. Such questions are "Have I made clear to you the great advantage of this

feature?" "You see, now, don't you, why there is such a great demand for this article?" "If the matter is properly presented to him, it doesn't take a man long to see that this offers a rare opportunity for profit, does it?" "Isn't this a reasonable conclusion?" Such questions tend to secure assent to the cogency of the reasoning and the validity of the conclusion. By noting the answers to questions and noticing carefully the expression and general attitude of the man the salesman can tell whether he remains doubtful, or is being convinced.

It is often advisable, as explained previously, to make a brief, condensed appeal at first. After this the salesman can feel out his customer to see how the appeal has influenced him. He can then adapt the rest of his solicitation to the state of the customer's mind revealed by this diagnosis.

The salesman should study men as he reads about them, plays with them, talks with them and does business with them. Such study should enable him to put himself, in imagination, in the other man's position, and thus to understand him to judge whether the customer is in a state of indecision or whether confidence has been established; when to confine himself to straightforward matter of fact business talk, or when to use subtle suggestion or finesse, when to follow, and when to lead or use strenuous methods.

On the whole, sufficient uniformity prevails, amid the great diversity of individual character, that cer-

tain methods will work well with nearly every customer. In most cases it will be wise to stick to "the one best way" until good reasons are seen for adopting an unsual course.

As the salesman is presenting his selling points in his solicitation the prospect endeavors, from time to time, to consider them in comparison with ideas bearing on the subject coming into his mind through association; but he will not be able to do this very deliberately, if the salesman is presenting his selling argument effectively.

As the salesman makes each point and asks the man for his assent, he invites him to deliberately weigh the reasons for and against and to decide on the basis of the strength of evidence. When the salesman has finished his main demonstration and presentation and undertakes to close, the man will endeavor to balance the reasons why he should purchase presented by the salesman, against the objections or reasons why he should not, which have occurred to him in the course of the solicitation. If the salesman has not already discovered what these objections are, he should bring them out by appropriate questions.

DEALING WITH OBJECTIONS

When a salesman has succeeded in arousing a desire for an article, he is often prevented from closing the sale by an objection present in the customer's mind. Such objections are technically known in psychology as inhibiting ideas. As long as such ideas of considerable importance are even lurking in the margin of a man's consciousness he will not close the sale. Hence, objections are important things for the salesman to consider.

The salesman should know in advance what objections are likely to arise in the mind of the prospect. The selling talk should be carefully worked out in advance to take the wind from the sails of opposition by anticipating and forestalling such objections as completely as possible. But, no matter how carefully the salesman has planned his selling talk, he will meet with opposition. To overcome this, he should have worked over very carefully in advance the answers to all objections that are likely to arise.

The objections will vary according to the nature of the article which is being sold, and its relation to the needs, interests, and desires of the buyer. Just as it is important for the salesman to select the value-giving features or qualities of what he is selling, and to determine to what interests of the pros-

pective buyer these qualities will afford a means of satisfaction, so it is equally important to find out what interests of the man are giving force to the ideas which serve as objections, and inhibit or keep him from buying.

Of course, the man may refuse to close merely because he is not yet convinced that the article offered is the best suited to satisfy the desire. He wishes to give further consideration to competing articles. The rivalry is simply between competing ways of accomplishing the same thing.

The rivalry may be between competing lines of satisfaction for the same interest. For example, if he buys an automobile as a means of satisfying his desire for recreation, he can not take a contemplated trip to Europe as a means of satisfying the same desire. Or, it may be that the satisfaction of the desire is not believed to be a matter of sufficient importance to offset the loss of the satisfaction of the other interests which must be sacrificed if the purchase is made. A competing interest gives force to the objection. For example, if I buy an automobile, I can not satisfy my home-owning interest, or my interest in accumulating money and being free from debt, or my interest in enlarging the scope of my business.

After the first brief presentation of the article, while the salesman is feeling out the customer, to see if he has reached the psychological moment for closing, the customer will probably avail himself of

the opportunity to offer such objections as have occurred to him. If he does not do so, the objections may be brought out by appropriate questions. An objection so raised gives the salesman insight into the prospect's attitude toward the proposition and affords an opportunity to connect the selling argument vitally with his trend of thought and feeling.

The salesman should not appear annoyed because the objection has been raised. He may say that he is glad he is dealing with a man who wishes to consider every side of the proposition, for it is one which appeals strongly to such a man. Let him feel that the objection is natural from his point of view, but proceed to change his point of view. However, show him that your point of view is right rather than that his is wrong. Never enter into a debate with the man or flatly contradict him, as you may arouse his combative spirit and make him feel that it is a point of honor with him not to yield.

In encouraging a man to argue, you bring into the focus of consciousness, ideas which suggest courses of action contrary to the one you wish to bring about. You start a line of thought which will allow all the interests you have created to die out. You are encouraging a man to try to think of every possible argument to support his point, when you should be trying to make him forget them. If the objection is the result of a misapprehension, remove the misunderstanding from which it arose.

When an objection is raised, face it fairly and

squarely. Answer it then and there if you can do so convincingly. An attempt to evade an objection, or a failure to meet it fairly may cause such action to be regarded as an evidence of weakness in the proposition, or a proof of incompetency in the salesman. If you can not fully answer the objection, say that you see clearly the point that has been raised. A great deal of its apparent weight will be removed by a clearer insight into the proposition. What little real force it has, is so far overbalanced by the advantages of the proposition that the objection raised will be seen to be a factor of very little importance. Minimize the importance of such an objection as fully as possible, and then rely on an effective presentation of the advantages of the article.

If much attention has been given to the consideration of the objection, it may be well to recall the advantages previously presented before proceeding with the selling talk. Perhaps a point of advantage can next be brought up which will greatly offset any force which may still be felt as inhering in the objection. It could be introduced with the remark, "Here is a very decided advantage which will appeal to you strongly along the line we have been discussing."

If the objection has been raised prematurely and can not be answered at that point it may be best to say "I believe you will find that matter satisfactorily disposed of when I have finished," and then

proceed with the solicitation, meeting the objection at the proper time.

What shall we do with an objection which we suspect of being present, although it has not been expressed? Even if one feels certain what the unexpressed objection is, he should not try to dispose of it by direct attack unless he is sure he can completely demolish it with unanswerable arguments. An unexpressed objection is probably lurking in the margin of consciousness. An unsuccessful attempt to answer it would merely bring it into the center of consciousness and thus greatly strengthen its force. Rather than attack an unexpressed objection which he can only half meet, one should depend on making his proposition so attractive that the customer's attention will be centered wholly on it, and the objection thus neglected will pass entirely out of mind.

Never suggest an objection for the purpose of refuting it, thus hoping to make your case stronger. One who does so may be suspected of setting up a man of straw merely to show how easily he can knock him down, or worse than that, to be endeavoring to distract attention from some real weakness in the proposition.

If the man will admit that the proposition is one that will bring him financial profit, but objects that he can not afford it, show him the loss of profit which will result from delay. Make him see that the article will begin paying for itself as soon as it

is obtained. If you are selling him the satisfaction of some interest other than that of making money, impress on him strongly the satisfaction he will lose by postponing the purchase.

Suppose a man intends to buy, but that he does not close because he has made up his mind to investigate more fully, from fear that he may overlook a better bargain. Should one attack competitors, or try to show that their lines are inferior? An attack on a competitor or his line, might arouse suspicion that you feared to have the customer look around. This would increase his desire to do so. There is a motto which may throw light on the matter by approaching it from another point of view. It is "If your competitor talks about you put him on your pay roll. It doesn't matter what he says as long as he talks." When he talks unfavorably about you he suggests that your competition is affecting his business seriously. This suggests that one may do better by seeing such a competitor. People are likely to resent an attack which seems unprovoked and which is made under such circumstances that the one attacked has no opportunity to defend himself.

If you wish to explain the difference between your article and some other, you may say the competing article is inferior in appearance, usability, durability, etc., or you may say that your article excels in appearance, etc. The latter is better. Attract attention to the superior merits of your article

rather than the demerits of the other. When you meet competition, put your emphasis not on demolishing it, but on making clear the strength of your own claims.

If you attack the idea of looking elsewhere, you may merely bring it into the focus of consciousness and make it more effective in controlling action. It would be better to appear perfectly willing to have him make a thorough investigation. Express your confidence that no competitor can surpass your offering in real merit. Your bargain will appear more attractive after the other things are seen. It may be well to talk about something else for a little while. Then return to your article, paint it in attractive colors, make your enthusiasm about it and confidence in it so clear that you will inspire a like feeling in your customer. Make your proposition so attractive that it will fully occupy the focus of consciousness. Make the desire for it so strong that the inhibiting ideas will pass farther and farther into the margin of consciousness, until at last they fade from view and lose their force completely. You have then, in the terms of technical psychology, dissociated the idea of the act you wish to have performed from the idea of acting in a contrary line, which prevented or inhibited the performance of the desired act. Then is the time to make a suggestion directed toward closing the deal.

The most successful salesman is the one who presents his selling points or reason why, so skillfully,

so enthusiastically, so convincingly that the attention is so fully occupied with them, that reasons why not do not come to mind. A salesman who consciously or unconsciously suggests objections is greatly increasing the difficulty of making the sale. It is often easier to anticipate or avoid suggesting opposing ideas than it is to deal with them after they occur.

MAKING KNOWN THE PRICE

If you succeed in arousing desire, you will no doubt lead the customer to ask the price. If he thinks it is too large, be prepared to show him it is reasonable; considering the satisfaction, saving or profit which will come from the article.

If he asks the price before you are ready to tell it, tell him you wish to make clear to him what it will do for him before you tell him what it will cost. Say you wish to make his understanding of the proposition so clear that he will be able to pass a correct judgment on the reasonableness of the price. If the customer is told the price prematurely he will be thinking about price when he should be thinking about quality.

FEELING OUT AND CLOSING

The fiat, or decision, or act of will performed by the customer in closing the sale consists in consciously dismissing or disregarding all ideas tending to oppose the deal, and in decisively accepting the proposition and giving the attention freely and fully to the performance of the act necessary to closing. Closing is cutting attention loose from opposing lines of action and centering it on the act of purchasing.

If the suggestive force of the solicitation has been strong, even if opposing ideas prevent the full performance of the act of closing, the act is at least incipiently performed. That is, faint tendencies to perform the act are manifested in the appropriate organs. These tendencies will at once pass out into the complete performance of the act, if the customer can be led to turn decisively away from further consideration of opposing ideas. The natural impulsive power of the idea of the action then becomes fully effective in bringing about the performance of the action.

To get the customer into a state of mind in which he is ready for closing, the salesman must keep his attention centered on the attractiveness of the bargain he offers, not on his own desire to sell. Every point he has scored in his solicitation,

whether in creating confidence in the integrity of his firm, in the desirability of the service it has to offer, in his own knowledge, honesty, and judgment; or in making clear the quality, style, value, or other desirable features of what he has to offer, each point, if properly made, will have suggestive force persisting and converging toward the act of closing.

The sale may be lost by talking too long, as the salesman may thus suggest some idea which may again arouse a state of indecision in the mind of the customer who has practically decided to buy. The salesman must judge from the words, attitude, manner, and expression of the man, when it is best to endeavor to close.

The so-called psychological moment for closing is when the customer has become interested and convinced and feels a desire and impulse to purchase, then the time is ripe to make the attempt to close. To bring about this state of mind, the salesman, toward the close of his solicitation, should hold the attention of his customer centered on the most attractive features of his proposition, by enthusiastically presenting his strongest selling points in brief review, or summary form.

To determine whether the time is ripe to make an effort to close, the salesman must employ what we have called feeling-out suggestions. He may thus sound his customer by making a suggestion to action which, if carried out, implies willingness to make the purchase. Generally the suggestion is made by

asking a question of such form that the customer shows willingness to close if he gives the suggested answer. Examples of feeling-out questions will be given later.

The suggestion that the customer definitely commit himself, gets its effectiveness, not through the force or persistency with which it is made, but as a result of the proposition commanding the interest and attention and arousing the desire so fully that it excludes all thoughts or tendencies to act in a contrary line. To prefer the proposition is to attend to it to the exclusion of other lines of action. To make the act of choice is to cut loose from opposing ideas and center the attention wholly on the thing chosen. When the attention thus centers itself on the act of purchasing, the recognition of the desirability of making the purchase becomes the fiat of the will that the thing be purchased. The customer then says the decisive word, writes his check, or signs his name, or does whatever else is required to close the deal.

When this stage in the solicitation has been reached the salesman should not ask "You don't want to buy this, do you?" or even "Will you buy this?" He should act as if he were reasonably certain he would do so. His tone of voice, words, manner of expression, and actions should all show that he is confident of making the sale. He should make his question serve as a suggestion that he buy. "This looks like a good proposition. How many will

you need?" The salesman can handle the goods he is displaying, or his order book in such a way that he will make clear his belief that the sale is as good as made. But great tact is required not to offend the customer. It is only a short step from the attitude of the salesman confident for good and sufficient reasons, to that of the conceited and presumptuous fool.

If the salesman feels that the man is about to turn him down, he should lead him to talk about some unrelated matter he is interested in, such as baseball, the theater, church, or politics. When he feels that he has got him in a favorable state of mind, he should again present his subject with renewed enthusiasm and see if he can not carry the man along with him.

In feeling out a customer to find out whether the time is ripe to attempt to close, the salesman should ask him questions which will reveal the state of his desire in such form that the answer suggested would commit him to making the purchase. These questions should be framed so that they can not be answered by yes or no. Such questions are, "Which style, or finish, or model do you prefer?" "How much do you think you can use?" "How soon would you want it?" The insurance solicitor can say "When will it be most convenient for you to take the examination?"

The customer may ask from the salesman questions which would bring from him answers he

should get from the customer. The situation may be handled in this way: If he asks the salesman which style or model he prefers, he can say "That is a matter of individual tastes and needs. Which do you think would best satisfy your needs?"

If the customer makes a selection, put it down at once. After you have closed the deal you can return to this point and rectify the mistake, if you think one has been made. Or you can rectify it then and there, but after it is down. Of course, the salesman should give the buyer the benefit of his wider experience and greater knowledge of the thing he is selling, and sell him what is best adapted to meet his needs, not what he may wrongly have taken a fancy to, through a mistake in judgment.

If the customer asks how soon he can get it, ask him how soon he will want it. If he says right away, say "All right, we'll wire the order right in and have it sent immediately by express." If he asks what terms he can secure, ask him what terms he would like. When he has indicated his preference, as to style, quantity, date of delivery, etc., put them down and say, "All right, sign right here, so that there can be no mistake about the details, and we'll have it here promptly."

In closing an insurance solicitation the following procedure might be followed: The agent could secure assent to his proposition by some such statement as the following, summarizing the main points

of the appeal: "Mr. Blank, I am sure you will agree with me that every man ought to secure himself against business failure and provide for a comfortable old age. He ought to take every precaution to see that his family will be protected against hardship after his death. I have shown you an absolutely safe and sure means of accomplishing these things. I believe you see that the $5000.00 endowment policy I have explained to you will meet your demands satisfactorily. Your signature on this application (as he presents the blank and a pen for his signature) will insure this protection for yourself and your family. Be sure to write your middle name in full." The presentation of the blank and pen, and the remark about the middle name, center the attention on the act of closing. They suggest strongly that the act be performed.

If the man hesitates to sign, the agent should again summarize his main points, presenting them in his strongest way, and show him he is urging him to take a step in line with his dearest and most important interests. He should show that any sacrifice he may be called upon to make in buying this protection is so small that it may be disregarded in comparison with the satisfaction of knowing that his business is safeguarded, comfort is provided for old age, and those he holds dearest are protected against hardship.

In attempting to secure the signature the agent should place the order which he has made out as the

points were agreed on, in a convenient position for signing, should indicate the place for the signature and offer the pen to the man as he says "Sign right here, please." If the man hesitates the agent should add, while still holding the pen and blank in such a way as to suggest signing, "We'll have it here on time and you will be even better pleased with it than you anticipate. You will look a long while before you find a better bargain than this." Of course, it is hardly necessary to say that the remarks given above can not be comitted mechanically and used in every case. We are trying by means of illustrations to suggest general principles which may be applied in ways adapted to varying circumstances.

The request for the signature must be made very tactfully to avoid giving offense. The customer will naturally resent very strongly anything that suggests that his word is not as good as his bond.

To avoid such an implication, as he places conveniently before the customer the order he has filled out and offers him the pen the salesman can say: "Please sign here to show that this order is correct," or "to O. K. it," or "to approve it," or "to authorize us to send it to you." On the order presented for signature the salesman should have written the "O. K." or "Approved," or "Authorized," so that the buyer can conveniently sign his name under it.

The retail clerk could attempt to close with his customer by asking "Which quality or pattern do

you prefer?" "How much do you need?" "Will you have it sent out?" He could lead on a hesitating customer by such remarks as "You won't find a better bargain or a more becoming style than this." etc.

In attempting to close, take for granted, but not in a presumptuous or conceited way, that you have made the sale. The answers to the questions you ask, or the responses to the suggestions you make will guide you in further efforts to close.

Sometimes it is necessary to attack directly and overcome a determination to delay the decision until some future time. The salesman must show that the decision should be made now. The customer has all the evidence clearly in mind. He feels its full force. He is in a better position to decide now than he will be later on, when some of the important features will no longer be clearly grasped.

You have made a careful examination of this proposition. You are convinced that this article is all, or more than is claimed for it. You are conscious of a strong desire to secure it. You believe that purchasing this article will further your best interests on the whole and in the long run. Why should you delay. Your vision of your true interests is clearer now than it will be later on. Now is the accepted time. This opportunity is open to you.

The successful man is the one who has the strength of will, the decisive character, and courage of conviction which lead him to reach out and grasp the opportunity for profit when it is offered. By

embracing this opportunity you will put yourself in a position to grasp other opportunities later on. In the past you have no doubt regretted that you did not inconvenience yourself a good deal to take advantage of opportunities offered, which your deliberate and better judgment told you would turn out well.

Your success has come from promptly taking up good things when they were offered. I am absolutely sure that this proposition is to your advantage --that it will do even more for you than I have claimed. My reason for insisting now is that I am more interested in your future success and good will, than in putting through this particular deal.

I would not be acting in accordance with the true interests and permanent prosperity of a valued customer if I did not urge you to grasp your opportunity when it is offered. Your interests are identical with my own interests and the interests of my firm. We wish you to build up your business so prosperously and to derive such satisfaction from selling our goods that you will be on the market for larger orders in the future.

Our future growth and prosperity is absolutely dependent on the increased business and profit of our customers. I am urging this matter on you so strongly because I know that here is offered to you a great opportunity, and I know that your acceptance of it will bring mutual and lasting satisfaction to both of us. Feeling as I do, I would be disloyal

to your interests and those of my firm, if I did not urge you with every resource at my command to embrace this golden opportunity for profit. I am sure you will follow your own best judgment and grasp this opportunity leading straight to great and lasting success.

I recommend that you try about this amount. You will dispose of it so readily that you will want more in a short time. Shall we make the order for this amount? Of course, when the words "this amount" is used above, the salesman must state the quantity, amount, style, or type of article he honestly believes the man can handle successfully. The talk should be adapted, all the way along, to the thing offered for sale.

If the man objects that the amount mentioned is too large, show him that the experience of other men similarly situated has been that if only this amount is ordered, it will be necessary to reorder in a short time. If an advertising campaign is being carried on to assist in selling the article, show him that it is bound to create a large demand. Suggest to him ways in which he can display, or advertise the article so as to dispose of it profitably, etc.

If he objects that it costs too much, make clear the difference between an expense, which brings in no return, and an investment which will increase profit or reduce expense. If you are selling the satisfaction of some interest other than that in wealth, show that the satisfaction he will derive from

the purchase will more than offset the sacrifice in purchasing it.

Suppose the man is satisfied with the line of goods, but will not close, though it seems probable that he will do so later on. The salesman could leave an order blank with him to use in sending in an order, though there was not great hope that he would use it without further solicitation. It will at least suggest strongly that he is desirous of getting the order and confident of securing it later on. The confidence as expressed may help hold him in line when he is approached by competitors.

The salesman can do something toward retaining the interest he has aroused, by asking him to remember that his goods have the quality which give satisfaction, and selling points which make them easy to sell. This is the line he will ultimately buy. Make it clear that you can give him pointers which will enable him to handle your line successfully. Get the advantages of dealing with you so firmly associated with the general line of goods that when he thinks of ordering in that line he will think of your line. Get his assurance that he will give you another chance before ordering.

AFTER CLOSING

When the sale has been closed, the best course for the salesman, as a general rule, is to let well enough alone.

In many cases the salesman's task is not ended when the sale is closed. Frequently the objections, or doubts, or inhibiting ideas which were lurking around unnoticed in the dim margin of consciousness, kept out of the center of consciousness by the effective solicitation of the salesman, will crowd triumphantly into the spotlight of consciousness as soon as the salesman has left. Fears and doubts and regrets will fill the purchaser's mind. Don't leave your customer in a doubtful, over-persuaded, or half-convinced state of mind, with a lurking fear of failure which will partially paralyze his efforts and make the transaction a bad one for him.

Leave the purchaser confident that he has made a good bargain. Give him suggestions as to how to make the most of it. His effectiveness in pushing your line will depend on his confidence in it. A hopeful outlook founded on a reasonable basis will make success practically certain. A few well-directed suggestions tending to start the customer's thoughts to working along the line of developing his proposition in the most effective way will help materially to keep the paralyzing devils of doubt from

getting a prominent place on the mental stage. The salesman can thus pave the way for the success of his customer and for future sales for himself.

Just as the physician can contribute materially to the recovery of his patients through suggestion, so the salesman can use suggestion to improve the business of the customer after the sale is made. He can impress on the man who has bought, the qualities which give the article commercial value and the best ways of presenting them in selling talk, in display and in advertising, and the best way to handle sales. He can give him advice as to condition of markets, amount of stock to carry, coming fashions, and how to meet competing lines, etc. Of course, this helpfulness need not be restricted to the line the salesman handles.

THE DEPARTURE

After the solicitation has been finished the salesman should not make further demands on the customer's time. He should make his departure promptly and as tactfully as he made his approach. It may be well to express confidence that the satisfaction to be gained from the purchase will measure up fully to the anticipations aroused by the selling talk.

The salesman should thank his customer cordially, whether he has made a sale, or not. He should make it clear that he desires to be informed at any time when he can be of service, and say good day.

He should carefully avoid making the impression that his interest in the customer ended when the solicitation closed. The prompt departure should seem to come, not from a hurry to get away, but from a desire not to waste a busy man's time.

GENERAL CONSIDERATIONS

The true salesman loves the game of selling. He studies its theory and strategy. As the runner warms up to the race, so his enthusiasm increases as the competition becomes stronger. He is a good sportsman when he loses.

A growing salesman studies his successes and failures to find out why and how he made them. A man is stronger after each defeat, if he takes the pains to learn the cause of his failure and avoids that cause in the future. He is ever on the lookout for suggestions which will increase his power and skill. He finds them in the course of daily business, in swapping experiences with other salesmen, in attending conventions and in reading books and periodicals.

The salesman should acquire the habit of concentrating all his energies on what he is doing. However he should not hustle and bustle and waste his energy with unnecessary strenuosity. Over tension and anxiety are more exhausting than work. Worry and nervousness are great enemies of efficiency.

Every one should maintain a healthy interest in some avocation so that he can turn to it for rest and recreation. Some form of athletics, the theatre, some branch of study, any one of many things will do, provided he can arouse a healthy interest and

forget business while engaging in it, and return to business later on refreshed and re-energized. One should eat rationally, secure plenty of sleep and exercise and see that he is fresh and vigorous when undertaking important tasks.

The salesman's usefulness to his firm is measured by his loyalty to it. He should regard its concerns as his own. He should not carry a side line which may lead him to neglect his employer's interests. If a man cannot be loyal to the firm which employs him and become thoroughly interested in his work, he should hunt another job. It will be best for both him and the firm in the end.

The salesman should have a broad and accurate fund of general knowledge, and be interested in the recreations and business pursuits of his customers so that he can talk interestingly on other subjects than shop. Ignorance revealed in any subject a well informed man should be up on, lessens esteem and destroys confidence. General knowledge and culture add to personal attractiveness and make not only a better salesman but a more useful citizen.

The salesman should ever try to excel his past performances. He should hold before himself a yearly, monthly, weekly and even daily amount or "quota" which he endeavors to attain or excel. He should keep himself keyed up to hard work. One rarely works up to the limit of his powers. He should cultivate the buoyant, persistent, resolute spirit which will not acknowledge rebuff or defeat, as long

as there is a chance for success. When defeat comes, he should think of it only long enough to grasp its lesson, and should then devote his thoughts and energies wholly to planning and gaining future success.

SALESMANSHIP AS A PROFESSION

A study of the general conditions, factors, and processes involved in producing and marketing serviceable things is an economic rather than a psychological study. However, there are many problems in this field that can be solved only by the application of psychological knowledge.

Salesmanship plays the part of central and prime importance in the processes involved in the exchange of services or serviceable things. The function of salesmanship is to bring about a mutually advantageous exchange of services, or of serviceable things.

In order that the part which salesmanship plays in marketing services may be ranked as a profession, the salesman must attain a mastery of a fund of practical skill and special knowledge. This knowledge embraces the mastery of a body of scientifically developed and sytsematically organized general principles which must be applied in the intelligent practice of the art of selling. In order that the work of the salesman may be accorded professional standing, the special fund of knowledge and of skill in dealing with practical affairs must be employed in such a way that the exchanges of services which are brought about will be mutually and fairly advantageous to all parties concerned.

In order that the work of the salesman may be

ranked as professional, he must have an understanding of the general and special problems of marketing commodities. Although a large part of this knowledge is economic, it may be well to take a brief glance at some of the more important features of the field. It may help the salesman to bear in mind that he should know and use more than is required merely to make a sale, if his vocation is to secure recognition as a profession.

PROBLEMS OF MARKETING COMMODITIES

A large problem can not be solved until it has been analyzed into its component parts. The general aim of business is to produce and exchange commodities fitted to satisfy the needs of men. To carry out this aim the needs must be clearly discerned and their importance for well-being must be appraised.

To realize its general aim, business must solve many difficult problems involved in the production and marketing of commodities. The solution of each problem in turn becomes a general aim which must be subdivided into many problems demanding solution. Each of these problems must also be looked upon as a combination of many problems. In discussing the process of thinking we have made clear the general method which must be followed in solving problems. We state here some of the problems marketing has to solve.

The salesman should understand the part his work plays in the complex processes of business. Business includes the industrial processes of producing goods fitted to satisfy needs, also finance, accounting, law, and marketing. The salesman performs a part of the work of marketing the service rendered by the business.

The general plan of marketing, or distribution, must be worked out by employing data gathered

from a careful study of some or all of the following factors, according to the nature of the commodity.

The market must be analyzed. What are the qualities of the commodity which fit it to promote well-being? Is it demanded by all, or by certain classes? Is the consumption of it continual, occasional, or seasonal? Does it serve a permanent interest, or an interest which has the nature of a fashion, or fad, or fancy?

There must be a survey of the field in which the market must be sought, to find, among other things: the present number of the consumers of the commodity, their per capita consumption, and the prospect of increasing either this consumption, or the number of consumers; the ratio of present consumption to unit area of territory, in various parts of the field.

The production and marketing of competitors should be studied to determine: their number, their combined and individual output, the distribution of their outputs, their best and worst markets, the accessibility of their markets, the channels through which their output is distributed, whether through jobbers, or direct to dealers or consumers, by salesmen, or by mail order, their advertising methods, etc., the location of dealers and jobbers in the territory; the possibility of increasing the number, etc.

The manufacturing methods of competitors, the merits and demerits, and prices of their commodities must be considered.

Those who have the direction of the marketing

should know, the financial resources and capacity of their own plant, the cost of raw materials, of manufacturing, of overhead expenses, and of selling, the amount of business possible to be secured, and the amount likely to be gotten, the amount of business likely to be secured in various districts of the market, estimated according to the area and accessibility of the districts.

The one in charge of the marketing should know the cost of production, the lowest price which can be accepted, the best price which can probably be obtained, the amount which any possible lowering of price would increase the consumption, and affect competition. When he has determined the price which should be asked to secure a fair return for service rendered, he should be able to estimate the probable sales and profit, as a basis of determining how much should be spent for selling and advertising. These estimates should be based upon what competitors are doing, the comparative desirability of commodities, and, if the business is new, the greater cost of selling resulting from the lack of good will.

The plan for marketing must be adjusted to the various conditions of territory and competition. It must take into account the capabilities and limitations of its own industrial and financial resources. A general plan of distribution should be formulated which is adapted to all the requirements revealed by the survey and analysis of the market.

The general plan of marketing should formulate

plans for advertising and selling. The advertising and selling plans should be properly co-ordinated with each other, and adapted to cultivating the market most profitably. An efficient shipping department should be organized.

In developing material to be used in the appeal of the salesman, and of the advertisements, the commodity should be studied to determine, whether it has distinctive features of serviceability, or whether it is difficult to distinguish from other similar things. The name, the package, and the trademark should be carefully scrutinized. They should be made attractive and distinctive, and should be protected as fully as possible.

The articles of competitors should be studied to get knowledge like the foregoing in regard to them. The strong and weak points in their appeals should be noticed, and how much they have influenced consumption. The efficiency of the advertising methods should be noticed, also the value placed on various media as evidenced by their use.

The stationery should be attractive. Follow-up methods and material should be carefully worked out.

The salesman should have a sound grasp of the fundamental principles of marketing. He should master the special marketing problems of his own line, as well as the theory and practice of selling. Specialization in selling narrows the view, unless it is accompanied with progress in general knowledge.

The narrow specialist in selling can not view the significance of his work in the right perspective. He can not readily adapt himself to the changes in conditions that are certain to come. He has small chance for promotion to a position of greater responsibility. Every salesman should have a knowledge of the broader problems of marketing, as well as a knowledge of the processes of selling, and skill in practicing the salesman's art.

The salesman should be thoroughly familiar with the plan adopted for marketing his commodity. He should understand the general advertising policy, and should keep in touch with the things done in carrying out that policy. He should carefully coordinate his efforts at selling with the advertising campaign, so that the salesmanship and the advertising will be mutually helpful. He should also see that the efforts of the local dealers are properly adjusted to profit by the work of the advertising department. He should be a competent adviser in regard to their methods of display, their local advertising, etc.

He must know the previous successes of the house in his territory, how much opportunity there is for growth, and where his efforts will be likely to bring the best results.

The salesman should know the terms of sale, the credit rating of those to whom he wishes to sell, and the normal requirements of their business in his line.

The salesman should keep the firm informed in

regard to the financial standing and business success of actual and prospective customers. He should be keenly alive to the amount and character of competition, its points of strength, and of weakness. He must know the style and quality of goods desired. He is ever alert to find how his own line may be better adapted to satisfy the needs of the consumers. The salesman must improve every opportunity to gather data which will be helpful to the manufacturing and marketing departments.

The foregoing should be taken as illustrative rather than literally prescriptive. It should be adapted to the particular conditions of the commodity. The aim has been to make clear that a man must be more than a narrow specialist in the art of selling, if he is to perform efficiently the duties of a salesman.

The aim of the business should be to render normal service to the consumer. The return secured should be only a fair exchange for service rendered. The salesman should be animated by the same ideal.

The salesman should be more than a mere expert in the art of selling. But general capacity and proficiency are not enough. He must understand the general principles of the processes of selling and have skill in practicing the art.

Psychological processes are the most important factors with which the salesman has to deal. The salesman must employ his own mental processes, so that he will be most efficient in influencing the mental processes of prospective purchasers, in such a

way that they will desire and buy. To do this, he should understand the mental processes of his own and the buyer's mind.

Practice guided, not by general principles, but by haphazard trial, may give a certain skill. One may, in this way, attain to a certain degree of success without being efficient.

An exhorbitant price is paid for skill acquired by this wasteful method. The skill so acquired is not adaptable to changing conditions, except by the same wasteful process of random trial and error and the selection of lucky hits.

The salesman must not merely understand the general principles of the selling appeal and the function of its various parts. He must acquire proficiency in practicing the art of selling.

The salesman must know many things about the particular commodity he is engaged in selling. He should know something of the materials and the process of manufacturing. He can then give the buyer an idea of the materials, and labor, and machinery required to make the commodity. He should thoroughly understand the serviceability of his goods. He should know the serviceability of his line in comparison with competing lines; the points of relative advantage and disadvantage, etc.

By this time, it should have been made clear to the salesman that, in practicing his art, he is dealing with psychological processes. Attention, interest, desire, suggestion, impulse to action, and many others, have been dealt with frequently in developing

the general theory of salesmanship. An attempt will now be made, in Parts II and III, to give a clearer understanding of these processes.

PART II

PROCESSES OF THINKING, FEELING, AND ACTING

BEHAVIOUR

Behaviour is purposive activity, or activity which aims at some desired end. Behaviour is intelligent, rather than merely impulsive, when it involves comparison of means available for the attainment of an end, and the selection of the means which the comparison shows to be best fitted for the attainment. Psychology deals with the constitution and processes of the mind as factors in behaviour.

DISTINCTION BETWEEN MENTAL AND PHYSICAL PROCESSES

Think about your brain! The brain is a material object. It can be weighed in ounces and measured in cubic inches. It fills a definite amount of space in the skull. Another material object can not be put in the space occupied by the brain without injuring and displacing it. When the skull is opened, the brain may be observed by a number of people at the same time. The brain is a manifestation of certain processes, known as vital and physical, the inner nature of which is clearly beyond our power of direct observation.

Now think about the thing which thinks about the brain. This is the mind, or the processes manifested in the consciousness of the thinker. Conscious processes do not fill space or have weight. The head is no fuller and one is no heavier when he is thinking of a ton of coal than when he is not thinking at all. The mind is not in the brain as the seed is in the pumpkin.

Objects of the material world may be observed by many. As far as our observation reveals, they are not conscious of their existence or of what is happening to them. Mental processes are conscious of being mental processes. In the lowest, or least developed, forms of living things the consciousness must be extremely vague and diffused. It probably takes the form of a feebly felt striving. In man, with whose mental processes we are here concerned, the mind not only thinks, feels and wills, but also knows that it does so. In man, conscious processes are self conscious. In self consciousness the ability to observe and classify and understand the function of conscious processes has been developed.

SUBJECTIVE AND OBJECTIVE REALMS

The things, of which we have experience, but which exist independently of our experience of them, are called objects of experience. They make up what is known as the objective world. Our conscious processes which experience the external objects, together with our experience of these objects

are said to be subjective. Our thought or idea of another person, or of a house, or other material object, is subjective, but the person or the house is objective.

METHOD OF GAINING PSYCHOLOGICAL KNOWLEDGE

The study of mental processes is carried on by introspection, which means looking within one's own mind. Every normal person can observe and describe, more or less satisfactorily, what is going on in his own mind. He does so, for example, when he says he is puzzled, or was imagining, or thinking, or feeling pleased, or angry, or striving, etc. The introspection which the psychologist employs is similar to this universally practiced self observation. The psychologist merely takes more pains to make his observations clear, accurate, and complete.

Progress in the knowledge of the workings of one's own mind would be very slow, if one had to rely solely on the results of his own introspection. In psychological literature, one finds accumulated the knowledge gained by the efforts of the best observers and thinkers of countless generations of men. Psychologists have gathered the general conclusions from this wide range of observation and experience, and have arranged and classified them and tested their truthfulness by applying them to experience to see whether they would work satisfactorily in giving us guidance in dealing with experience.

Reading, alone, will not make a good psychologist,

any more than it will a good physician. A book can only serve as a guide in pointing out what to look for, where to find it, and what its significance is. If one is to acquire useful psychological knowledge, he must become interested in, and skillful in observing what goes on in his own mind.

One has not mastered the general principles developed in this book well enough to make them helpful in the practice of salesmanship, until he can illustrate them with elements of his own experience, other than those given in this book. One has not mastered a thing until he can apply it successfully. Attempt at application is an efficient method of learning. One can thus tell whether he has grasped a thing. If one can not verify in his own experience the truthfulness of the general principles explained here and provide additional illustrations of them, he has not adequately grasped them.

EXPERIMENTAL PSYCHOLOGY

Certain mental processes have been studied experimentally. By using the apparatus and following the directions of the original experimenter, the processes can be reproduced as often as desired, under conditions which free them, to some extent, from confusing and distracting factors. In this way the conclusions of the experimenter may be studied by many different observers, and modified, or corrected, or verified as holding good for all minds. Experi-

ment, when it can be applied, merely aids, rather than takes the place of introspection.

KNOWLEDGE OF THE MINDS OF OTHER

Psychology assumes that the minds of all men work according to the same laws, and that conscious processes and behaviour are similarly correlated in all persons. That is, the same conscious processes are manifested by the same forms of expression and behaviour.

Also simliar forms of expression and behaviour may be assumed to have resulted from similar conscious processes.

We can not directly observe what is going on in the mind of another. The mental processes of another can only be inferred from what he says and the expression of his countenance, and the tone and manner of saying it, and from what he does and his manner of doing it. These things that are significant expressions of the mental processes of others, can be interpreted rightly only as one, as the result of accurate introspection, has a correct knowledge of the processes in his own mind which have the forms of expression he observes in others.

Not only thoughts, but also feelings and volitions are communicable. Through understanding the interplay of processes in his own mind one gains insight into the interplay of processes in the minds of others.

In saying that we know the minds of others only

by inference, we do not mean that we must clearly discriminate the significant expressive elements in the total impression we are receiving, and center attention on them, and make explicit inferences from them. Through wide experience, carefully digested, we learn to apprehend the subtle expressions of the feelings and emotions of those with whom we deal, without being able, in many cases, to tell just how we do it. We learn to apprehend the symbols of these as readily as we learn to apprehend the thoughts expressed by verbal symbols. Our attention is not directed to the symbol in either case.

The ability to understand the feeling and motives of others is largely instinctive. One who did not have at least an innate capacity along this line that could be readily developed in experience would not get along well with his fellows.

CLASSIFICATION OF CONSCIOUS PROCESSES

Psychology aims to describe and classify the various conscious processes as they are manifested in experience, and to make clear their correlations with behaviour. As one observes his conscious processes he will distinguish in them three aspects, known as thinking, feeling, and willing.

The processes of knowing about things are studied in psychology under the headings, sensation, perception, conception, association, memory, apperception, judgment, and reasoning.

In sensation and perception we get a knowledge of our own bodies and of the external world. We may distinguish a mere sensation of warmth, cold, light, color, sound, touch, taste, smell, pressure, muscular strain or motion, without referring it to any particular object. But when we are aware of a warm object, or moving object, or colored object, we are said to have a perception of the object. We can distinguish a sensation of red, but we have a perception of a red apple. In the perception of the apple, along with the actually experienced sensation of redness, we attribute to it various qualities as roundness, smoothness, weight, taste, edibility, etc., which, our previous experience has taught us, are possessed by apples.

We form concepts or general ways of thinking and behaving in regard to objects, we pass judgment on them, and enter into extensive trains of reasoning about them.

We not only have various processes of knowing about objects; we are also affected by them. That is they arouse feelings of pleasure or pain and various emotions. A cut or bruise causes a feeling of pain. When you are cold, a fire gives a feeling of pleasure. Other experiences may give rise to the more abiding emotions of joy, sadness, pity, sympathy, hate, love, jealousy, respect, anger, fear, remorse, happiness, etc. These emotions spring from more complex intellectual processes than do the feelings. They are also tinged with pleasure or pain.

The volitional processes are attention and volition. They will be studied more fully later on.

The processes of thinking, feeling, and willing, are merely distinguishable, but not separable, aspects of the one conscious experience. Thinking, feeling, and willing are manifested, with varying degrees of prominence, in every conscious process.

MIND AND BRAIN

Mental processes are accompanied by and depend upon brain activity. Increased mental activity involves a similar increase of brain activity. The increased brain activity requires more nourishment and produces more waste matters to be eliminated. Other organs of the body such as those of digestion, the kidneys, the liver and the lungs must work harder to supply the energy and eliminate the waste. A sound mind requires the services of a sound body.

Salesmanship makes heavy demands on both the mental and physical processes. The efficiency of the salesman will vary with the general condition of his body. He should be careful to take proper food, exercise, recreation, etc. Excessive exercise or severe manual labor impairs the efficiency of mental processes. Loss of sleep prevents proper nourishment and removal of waste matters. It causes a temporary loss of weight, with a corresponding decrease in the amount of energy available for work.

HABIT

When we first undertake to perform a new act which is complicated, or requires special skill, our efforts are hesitating. Awkward and groping movements that are bungling and ill suited to the purpose are mingled with those properly directed. We note

with satisfaction the well directed movements, and endeavor to repeat them and to check the others. With practice, the movements gradually become better co-ordinated, more accurate, and easier to perform.

Painstaking effort, faithfully persisted in, develops skill. Finally, the whole complicated process is running smoothly. It runs along, almost without conscious supervision, while attention is directed to other things. Through discriminating practice and repetition, complicated acts come at last practically to repeat themselves, although they at first required careful thought and effort to perform them with indifferent success. To all intents and purposes the acts have become automatic. Acts which have thus, through practice, come to be practically automatic, are called habits. Thus we have learned to walk, to eat, to talk, to read and write, to sing, or play, or run a typewriter, or do the countless other familiar routine acts with which our lives are so largely filled.

The explanation of habit formation is largely physiological, rather than psychological. However, some hold that habit involves some psychical modification, as well as physical. The tissues of the brain are plastic. Plasticity means that the brain cells are modified by, and permanently retain, the effects of the activity which takes place in them. Nervous impulses, or currents of nerve activity, are aroused in the organs of sensation such as the eye, ear, or hand. They go through the brain, and then pass out

through another set of nerves to control muscular activity. In so doing they leave an effect on the nerve cells, or a "path" that other impulses will tend to follow. By repetition, definite channels are developed, which currents of nerve activity habitually follow.

While these channels are being developed, conscious supervision, guidance, and effort are necessary in performing the acts. When the pathway of nervous discharge has been definitely established, the impulse follows it without guidance. The switches are set for the impulses in the nervous tissue to pass along the right tracks. The physiological organism has gained the ability to perform acts which originally required conscious supervision. It performs them more quickly, and more accurately and with less fatigue.

In forming habits, the brain has been moulded by practice. It has taken on stereotyped forms by means of which many of the routine acts of life may be economically performed. The lessons of experience are thus registered in habitual ways of thinking, feeling and acting about things. Familiar acts thus come practically to perform themselves, while the attention and intellect are left free to grapple with new problems and situations which arise. We thus see the importance of rendering habitual the routine acts of our daily life.

LAW OF ACQUIRING PROFICIENCY IN A NEW LINE

The movements, or procedure, involved in forming a new habit may be learned by the method of trial and error, or by imitation of others.

When the right procedure, or combination of movements, has been apprehended, the factors which make for success in forming the habit are:

1. Concentration of attention on the task.
2. Careful rehearsal, or repetition.
3. The avoidance of lapses into another procedure until the habit has been firmly established.

With the formation of the habit there develops a propensity to do the thing in the way being made habitual. The habitual way grows to be the pleasant way. A departure from it becomes unpleasant.

One should make a strong resolve to form the new habit. He should reinforce this by holding in mind the satisfactory consequences which will result from forming the new habit and the unsatisfactory consequences which will result from failure.

When a man takes up a new line of work, his general education and experience enable him to make rapid progress at first. Improvement is rapid at first, because the steps of progress are made largely by merely using old habits, and previously acquired skill and knowledge, and reorganizing them and adapting them to a new use. When these easy steps have been made, and when farther advance depends mainly on acquiring new knowledge and developing

new habits, progress becomes slow and difficult. The enthusiasm resulting from the novelty of the work fades away. For a time one seems to make no further advance in skill. He may even become less successful in the performance. He has reached what is known as a plateau in habit formation.

When a plateau of arrested progress or develpment has been reached, the faint hearted often become discouraged and quit. However, the knowledge that their experience is a normal one should give them resolution to keep on. When a plateau is reached, further progress depends mainly on the ability to hold one's self to the task by sheer force of will, until the new knowledge is assimilated, the new habits are formed, and the new skill is developed. Finally another stage of rapid progress will be entered upon, and may continue for some time, before another plateau is reached, and another stage of arrested progress must be worked through.

Our nervous tissues are plastic in youth, but become less easily moulded as we grow older. Under twenty is the time to fix right personal habits of eating, exercise, neatness in dress, well modulated speech, ease in intercourse with others, etc. Between twenty and thirty is the age best adapted to forming intellectual and professional habits.

To develop a new habit of this sort, start with determination and vigor to do the act. Improve every opportunity to practice it. Make no exception in favor of the old habit. One brief lapse into the old

way, will sweep away much that has been gained by long and painstaking efforts, and will greatly increase the chance of future lapses occurring. Banish the old habit from your mind by keeping your thoughts fixed on the new one, and on the satisfaction to be gained from forming it. Keeping the old habit in mind develops an impulse to perform it which it requires effort to resist.

Every one should realize early in life that he must work out his own fate. Whether he is a failure or success depends largely on the habits he forms.

We easily become slaves to bad habits, or to poorly formed habits. The hell hereafter is not more to be dreaded than the hell we can make for ourselves on earth by developing wrong habits.

Habit gets one into a rut. We grow to like habitual ways of doing things. Constant self-criticism, alone, will tell one whether his ruts are carrying out of the line of progress and of greatest efficiency.

One should endeavor to discover the most efficient ways of doing the routine matters of his business and to make them habitual as soon as possible. Attention can then be centered on the important problems clamoring daily for solution.

The discussion of habit will be continued under the topic, "Developing Character and Personality."

ASSOCIATION OF PROCESSES OF THINKING, FEELING AND ACTING

The effect that the solicitation of the salesman has on the customer, depends on the processes of thinking, feeling, and acting, aroused in the customer by the suggestions and arguments used. The form which these processes will take depends upon the habits and associations previously formed by the customer.

ASSOCIATION BY CONTIGUITY

To make clear what is meant by association by contiguity, think of the word "stock " for a few moments, and then notice what thought follows it in your mind. The word stock may suggest to you the goods in a store, the paper representing a financial interest in some corporation, the raw materials from which something is to be manufactured, or a part of a gun, or a thing to wear around your neck, or the stock from which a cook makes soup.

A merchant would be most likely to think of the goods in a store, a broker of the stock certificate, a farmer of the animals, a haberdasher of the thing to wear round your neck, a cook of the soup stock. This is explained by the fact that each man has formed a habit of going in thought from the one idea to the other. When such an habitual process has

been established between thoughts they are said to be associated by contiguity.

The law we are now considering is often called the law of association of ideas by contiguity. But in using the word idea, we should bear in mind that an idea is a process of thinking about a thing. Also that an idea may become associated with a feeling. For example, if one has become ill from eating an article of food which he has previously liked, the thought of eating the article thereafter may arouse in his mind a feeling of disgust, with its volitional tendency to avoid eating it. If a customer has been offended by a salesman, or even unjustly feels angry at him, or dislikes him for any reason whatever, the customer may thereafter feel ill will for the store which the salesman represents. On the other hand, a courteous efficient salesman, who is considerate of the real interests of the customer, will inspire a feeling of good will which will become associated with the thought of the business he represents.

The thought of the store is much more likely to revive the feeling of ill will or good will associated with it, than the presence of the feeling of ill will, or good will, in consciousness is likely to revive the thought of the store. We tend to pass more readily from the processes of thinking to the processes of feeling associated with them, than vice versa.

The following statement of the law of association by contiguity includes processes of feeling and willing as well as processes of thinking. If two pro-

cesses have been in consciousness together or in immediate succession the reappearance of one of them will tend to recall the other.

ASSOCIATION BY SIMILARITY

If one disregards the spelling of the word "stock" and centers his attention wholly on its sound, it may suggest the word "stalk" having a similar pronunciation but a different meaning. This illustrates association by similarity. The law is as follows. A process of thinking tends to suggest similar processes of thinking. A process of feeling does not in the same way suggest similar processes of feeling. The process of feeling rather tends to bring it about that the process of thinking, or ideas associated with it, will suggest other ideas which have a tendency to arouse a similar process of feeling. This point will be made clearer later on, in discussing emotional congruity as a factor in association.

If you think of the moon, some idea previously thought of in connection with the moon may come into mind in accordance with the principle of contiguity. You may thus think of "green cheese," or of something you did on a moonlight night, or of something you know about the moon.

If you focus your attention on the brightness of the moon, you may next think of the sun, or of a light, or of some other bright object. If you focus your attention on the spherical shape of the moon, you may next think of a ball, or some other object of

similar form. If you focus your attention on any aspect, quality, or characteristic of an object, the object may suggest any other object which has the same aspect, quality or characteristic, no matter how unlike the two objects may be in other respects.

Any object may suggest any other object which resembles it in any respect, provided the attention is focused on the quality in which the objects resemble each other. The similarity may be commonplace and evident, or far-fetched and fanciful, as in poetry. The similarity may be one of abstract relationship and difficult to perceive. A classical example of this is Newton's perception of the similarity in relations between an apple falling to the earth and the moon drawn continuously toward the earth, so that it moves around the earth, rather than passes off into space in a straight line; as it would do, if it were not attracted to the earth as the apple is. By assuming the force which holds the moon in its orbit to be the same as the force which causes the unsupported apple to fall toward the earth, Newton was able to demonstrate that the motions of all the bodies in the universe conformed to the law of gravitation. He proved the universality of the law of gravitation. The great inventor is the person who sees the similarity of relations which makes it possible to put a familiar contrivance, or process, to a new use.

The great poets and artists, and leaders in thought, the great inventors and captains of indus-

try, in short, the geniuses in every line, have minds unusually fertile in association by similarity. Fortunate is he who can see the resemblance of things!

An idea which a salesman presents in his solicitation may arouse in the mind of his customer, through association by contiguity, any idea which the customer has habitually thought of in connection with the presented idea. But other things being equal, the presented idea is more likely to suggest an idea which has been recently or vividly thought of in connection with it. Or the idea suggested by association may be similar to the idea presented, and will probably be in harmony with the existing emotional tone of the customer.

It is probable that the word stock, when previously thought of, revived the idea most firmly connected with it by habit. Now stock may suggest a neck piece, or soup, because the latter ideas have been recently in mind, and probably vividly so, since the association caught the attention because it seemed far-fetched.

If you were in a vindictive frame of mind the word stock might suggest the "stocks," a contrivance formerly used to punish criminals. To an unsuccessful or discouraged merchant, the word stock may suggest that he has too large a stock on hand already, and that he should reduce it rather than add to it. A successful and optimistic merchant tends to think of increasing his stock, as a means of increasing his profit. The trend of association is thus

determined by the emotional state. The idea brought to mind by association will tend to be in harmony with the prevailing emotion.

His emotional state is an important factor in determining the thoughts and actions of a man. The "bull" is in an optimistic attitude of mind in regard to future prices, while the "bear" is pessimistic.

The salesman must endeavor to arouse in his customer's mind a general emotional attitude favorable to the acceptance of his proposition. He should aim to create a feeling of confidence that business will be prosperous in the immediate future. A desire for profit aroused will tend to make one buy the thing offered as a means of increasing profits. A vivid fear of loss will make it easier to sell fire insurance, or a fire-proof repository for business records.

MEMORY AND THE ART OF RECOLLECTING

The law of habit, manifested in forming associative connections among mental processes explains the ability to revive, recollect, or recall processes previously experienced.

The memory and recall of mental processes depends upon the fact that during the experiencing of the processes the structure of the brain is modified. A permanent change takes place in the structure of the cells of the brain and in the arrangement of the connections between them. The brain thus retains a trace of the mental process after it has passed out of consciousness. The activity has established a course through which the nervous excitation will tend to pass more readily in the future. A stimulus is more likely to follow a previously established course than to open a new one.

The existence of such an inactive brain path is retention. When the brain path is again stimulated to activity it gives rise to, or revives, the mental process which accompanied its formation. The process is thus remembered and recalled.

In studying memory and the art of recollecting, it is convenient to use the familiar term "ideas." However, we should bear in mind that an idea is a *process* of thinking. A process of thinking is found only as a part of a conscious process which also in-

cludes feeling and volition. The conscious process always has these three distinguishable, but not separable, aspects or factors, of thinking, feeling and willing. But, in order to get a clear understanding, it is necessary to study one aspect or factor at a time, while others are disregarded. In studying memory, our attention is thus mainly directed to the process of thinking.

When we are dealing with the conditions which account for the retention and recall of ideas, we naturally ask how can one increase his ability to retain and recall the things he wishes to know?

Ideas may be remembered and recalled as a result of associatively linking them together by mechanically repeating what we wish to recollect. Will practice in this form of memorizing increase our ability to memorize? Many experiments have shown that the retentive capacity of our brain tissue can not be noticeably increased by any effort of ours; though it will vary with our freshness, fatigue, health and age. It is possible to make great improvement in one's ability to memorize, but other methods than mere mechanical repetition are required in order to achieve the result.

The ability to retain and recall ideas can be increased only by forming improved habits of memorizing. The habits which make for efficiency in memorizing are a habit of clear and adequate observation and thinking, and a habit of discriminating and appropriate association. Both these habits in-

volve the habit of concentrating the attention.

The prime essential of correct memorizing is to see that the things one wishes to be able to recollect are clearly and correctly perceived. The fact that one wishes to remember a thing shows that it has certain qualities which make it a factor bearing favorably, or unfavorbly, on the satisfaction of some interest.

The qualities which make the thing such a factor are the essential or significant qualities. In other words, the meaning of a thing is its bearing on the satisfaction of our interests.

The thing should be linked firmly by association with the interest whose satisfaction it concerns. The most salient, or characteristic qualities, that is the ones which will serve most readily and certainly as a means of recognizing the thing, must be singled out and carefully noted. They should be associated with the less obvious or significant qualities, or meaning, to serve as cues of recall.

We must carefully observe the essential or significant qualities of the thing. That is, we must note its bearing on the satisfaction of our interests. We must also note the significant and easily recognizable characteristics, and firmly associate them with the meaning of the thing. One should also observe the most natural or important connections between the object he wishes to remember and his previously existing store of ideas. These will be ideas closely connected by previously formed association with

the interest concerned with recalling the thing. We must connect these ideas with the idea to be remembered by as many association links as will be likely to prove useful. To make the associative connections between the ideas as serviceable as possible, the attention should pass from one to the other in the order in which it will be useful to recall them.

Two orders of recall should be established. The interest should serve as a cue to recall the thing as a means of satisfying it. The thing should serve as a cue to recall or awaken the interest and suggest to it that here is a possible means for securing satisfaction. To insure this result one should notice these relations and should endeavor to establish firm associative connections in both orders of recall. The occurrence of the need should suggest the thing. When the thing is encountered, it should suggest an opportunity of satisfying the interest.

Suppose that while studying salesmanship you are looking around for an opportunity to advance at some future time your interests as a salesman. When you meet men who may be able to give you a position, or help you to get one, you should firmly associate the idea of the men with your interest in getting a position. Your interest in getting employment should suggest the idea of the man as a possible means of getting employment. A meeting with the man should suggest that here is a possible opportunity to get employment.

Let us consider a more concrete illustration. Sup-

pose you meet a man and it occurs to you that "He may at some future time be on the market for what I am selling, or can give me valuable information or assistance." When you meet the man again you will wish to recognize him as a prospective customer, and call him by name. You will also wish to recall him when you are endeavoring to think of prospective customers to visit.

As you talk to the man, you should notice the most prominent characteristics of his appearance so as to impress a clear and accurate likeness of him on your memory. If you are a poor visualizer, and do not readily recall in memory, or picture to yourself how things looked when you actually saw them, it will be helpful to make to yourself a brief verbal description of the features of his general appearance which you believe will enable you to recognize the man when you see him again. You may compare and associate these with similar features of other men you know. For example, he looks like Smith but is taller. With this picture or idea of the man you must firmly associate his name, by thinking of it while making your observations. Use his name frequently while talking to him.

After the interview has ended, you should strengthen the association links you have established by recalling them and thinking them over. With them you can associate the man who introduced you, the place and circumstances of your meeting, the conversation you had with him, his business and so-

cial position and relation to other men you know, etc. Some, or all, of these, or similar associations you should form. You should firmly link them to your interest in the man as indicated above. Some men record in a note book the things they thus wish to recall.

If you wish at any time to recall the man's name, or appearance, or some fact about him, you can do so only by thinking over the ideas associated directly, or indirectly, with what you wish to recall, until one of them, or the combined force of all of them, suggests it.

ASSOCIATION PROCESSES IN EDUCATION

Education is the development of innate capacities of thinking, feeling and acting. Educational development takes the form of capabilities and habits of thinking, feeling and acting in such ways as will best contribute to the harmonious satisfaction of the various interests. This will be explained more fully later on.

The developed tendencies of thinking, feeling, and acting must be organized into serviceable association systems, if they are to serve effectively in securing satisfaction for the various interests.

PROCESS OF LEARNING

We may define the process of learning as the organizing of knowledge and skill so that they will be useful.

The efficient life is the well ordered purposive life. The efficient education is the one which arranges, systemizes, or organizes, the materials of knowledge and skill in such a way that they will serve most effectively as means of attaining life's purposes. Interests and purposes are the criteria by which one measures the value of things. Things have meaning and are valued, only as they are perceived as being in the relation of means to ends. The aims and purposes of life determine the selection of the elements to be associated and what associations shall be established between them.

Inefficient doing of a thing comes largely from inefficient thinking out of the method of doing it, or from failure to think at all. Efficient doing consists of selecting the essential factors from the unessential, and in skillfully organizing and employing them as a means of attaining the end in view.

In order to become generally efficient, one should formulate an ideal of efficiency and endeavor to attain it in every line of activity.

The principles of efficient learning and thinking

are the principles which make for efficiency in all lines of business activity.

Efficient thinking aims at the attainment of some end or purpose. Thinking will be discussed more fully later on. It deals with the solution of problems or the surmounting of difficulties hindering the attainment of ends. One must first think into his experience, or learn, what he would use later on in thinking out his problems.

When one encounters a problem, whether it is practical or theoretical, he can solve it only on condition that it suggests to him by the help of previously formed associations, the means required for its solution. The man who is efficient in grappling with problematic situations in an original way can do so only as his previously formed associations suggest original means.

The process of learning should be so ordered that it will be most helpful in thinking out problems. The most important question in education is how to organize the materials of experience into the most serviceable connections with each other.

One who wishes to accumulate a rich fund of experience, from which he can draw helpful suggestions when they are needed, should cultivate a questioning attitude of mind toward the matters with which his business is concerned. When he comes upon significant things, he should put them in his sinking fund of knowledge, by firmly associating them with the interests for which they have signifi-

cance. He will then have a wide range of knowledge at his command, from which he can draw to meet the obligations of thinking, when they are encountered.

MEANING OR SIGNIFICANCE OF THINGS

The meaning or significance of a thing is the bearing it has on the satisfaction of our aims or interests. Meaning lies in the qualities of the thing which determine our behaviour toward it. Chair, as a general notion, is a symbol of a class of objects with which we may do certain desired things. We class as chairs all objects with which we may do these things. We pass judgment on a thing when we put it in a general class and attribute to it the qualities of the class. An apple has a different meaning or significance than a chair because it concerns the satisfaction of different interests. A bench has a meaning similar to a chair. But its meaning is different from that of a chair, to the extent that the bench has certain qualities which affect the satisfaction of our interests in a different way.

A thing thus has meaning only as it recalls, through association, the memory of previous experiences with the thing, or with a similar thing. Our previous experience with an apple has revealed to us that it has qaulities with which we are concerned in various ways. When an apple is perceived, the meaning attributed to it comes from the awakening of previously formed dispositions to think, and feel, and act in regard to it. A thing has significance

only to the extent that present consciousness of it is supplemented by previous experience with it, recalled through association.

LEARNING AIMS TO GRASP THE SIGNIFICANCE OF THINGS

The purpose in learning is to discover the qualities of objects and the relations existing among them which affect our behaviour toward them, so that we can take intelligent advantage of the information in gaining satisfaction for the demands of our nature. We wish to know how our various interests will be affected by the various changes which may occur among the things of our experience. Knowledge aims at grasping the qualities and correlations of the objects of our experience so that we can deal with them intelligently in our efforts to secure the satisfaction of our interests.

Learning is a process of adjusting one's self to a new factor of experience, by the light of present and past experience, so that the factor will be properly appraised when it is again encountered in experience, or is considered as an element of future experience; and so, also, that the factor can be recalled when the needs of future experience so require.

The process of recognizing the signficant qualities and inter-relations of the various objects of experience is a process of judgment and inference.

MOST EFFICIENT METHOD OF LEARNING

To apply the most efficient method of learning, one should first find out the general nature and significance of the thing he is undertaking to learn. He should make a preliminary survey to see what interest is concerned with it, and the way it concerns the interest.

The next step is to get an adequate understanding of what is to be learned. The endeavor should be to get a clear, definite, and complete impression of all the parts of the thing in the order or arrangement in which they are presented.

In the third stage of learning, one should aim to select the more significant features, or qualities and characteristics, and to discern their relationships. Effort should be concentrated mainly on the proper understanding and arrangement of the more significant points. Less important matters should receive less attention.

In the last stage one should see that the general meaning, purpose, or bearing, of what is being learned is clearly in mind. He should review the associations fixed upon as most important, and see that they are properly organized and correlated with each other, in view of the general purpose.

By attentive and thoughtful repetition, the meaningful associations should then be firmly associated

with each other, and with the general purpose, in the order in which it will be most advantageous to recall them. A written outline will often give valuable help to learning.

Learning should be undertaken as a process of organizing the materials of knowledge in such a way that they will be most serviceable in attaining the purposes one endeavors to realize. Associations of resemblance or contrast, or contiguity, or class and member of the class, cause and effect, etc., will have ultimate value only as they supply means for realizing the ends which our trains of thought are endeavoring to reach. Hence, we see the importance of keeping aims and purposes in mind while forming the associations.

If one is to gain the greatest profit from the reading he does, he should apply the right method of learning. He should endeavor to grasp and condense or summarize the significant points of what he reads. He should fix upon the general topics to serve as cues of recall. He should make similar summaries of the subordinate points to be recalled under each general topic. While establishing meaningful associations among minor topics, he should at the same time, keep the general topic, under which they come, in mind, and link them firmly to it by similar associations.

He should clearly perceive the relations of the general topics as parts of an organic whole, and firmly fix in memory the perceived relations.

Learning should always be a process of working over and reconstructing in terms of one's own thought processes. In this there should be a wise selection and emphasis of what is significant for the realization of one's purposes.

The reader should be able to reproduce in his own words the definitions, generalizations, deductions, and other thought connections occurring in what is read. He should be able to make a systematic recapitulation, or summary, of what has been read. Taking brief notes will often prove of great practical help in mastering what is read, so that one can reproduce, in logical continuity, its salient features when one needs to recall them in his thinking.

When one is endeavoring to learn so as to reproduce verbatim, he should endeavor in like manner to grasp and organize the features which give the thing significance. He can thus greatly lessen the effort required in memorizing and increase the practical value of what is learned.

The great disadvantage of learning by means of arbitrary mnemonic devices, such as are employed in many advertised systems of memory culture, results from the fact that one does not grasp the meaning of the material so learned. Hence, the material is not available as a means of attaining the purposes which determine the trend of our activites. Bonds of association that are not meaningful are generally of little practical value.

It is generally more advantageous to undertake to

learn as a whole than in parts. But if the amount to be learned is so large that it seems expedient to break it up into parts, each part should be attacked according to the method outlined above. The various parts should be finally joined and organized as a whole and firmly associated with each other. In order to link a following part with a preceding part, by means of a cue of recall with which it has been associated, the general bearing and cue of recall of the following part should be held in mind while the preceding part is being reviewed and firmly associated with the following part. This cue should be one from which the various points of the following part can be developed readily in the proper order.

As the last stage of learning, one should practice recall in reviewing the whole until it can be reproduced readily. Weak associations should be strengthened. The practice in recall should be carried considerably beyond a point at which the whole can first be correctly reproduced. While practicing reproduction, the speed of recall can be gradually increased. What has thus been learned should be carefully reviewed on succeeding days, until it can be reproduced correctly and without hesitation. One should improve the earliest possible opportunity to make the first recall of what he endeavors to learn.

If learning is to be carried on most effectively, the attention must be intensely concentrated on the thing to be learned. Such application is very tiring.

One should not continue his attempt at learning until the element of fatigue paralyzes his effort.

After an attempt at learning, one should let his mind rest for a few minutes before undertaking something else. During this time the associations are becoming fixed. Their formation would be interfered with if other things were actively taken up. A brief rest will prevent such interference, or retroactive inhibition, as it is called.

INTEREST AND ATTENTION

Every one knows, in a general way, what is meant by interest and attention. At times one attends closely to an event he is witnessing, or to a conversation or speech he is hearing, or to a proposition which is being presented to him. At other times his attention wanders. He accounts for his inattention by saying he is not interested in the thing. It gives or promises no pleasure. It does not concern his fortune or welfare. One is likely to be inattentive to what a person says, if his personality repels, or his approach is not tactful.

Inattention to a thing that becomes an element of consciousness results from the fact that the attention is given to some other thing which arouses more interest. Absent-mindedness is a state in which one's attention is so completely concentrated on developing one line of thought that he does not notice other things which otherwise might arouse interest.

We may get a clearer notion of the nature of interest, from which attention results, and its relation to objects, by considering concrete examples. Ordinarily one is not interested in a time table. Even if he notices it, he at once turns his attention to some other object. But if one is going to take a journey, he may become intensely interested in a time table as a means of learning the trains that will take him

to his destination most conveniently. One's interest in the time table is satisfied, and his attention to it ends, when he has gained the desired information. His aim, or purpose, has been realized and his interest has been satisfied.

Perhaps the reader has previously had no interest in psychology, but has been led to believe that he can learn something from it which will enable him to improve his efficiency as a salesman. If he finds that an understanding of psychology will enable him to solve the problems of salesmanship more satisfactorily, he will become interested in psychology.

Objects not interesting in themselves will become so by bringing them into a significant relation to that which is already interesting. Show a man that the object you wish to sell him is the best means of realizing some aim or purpose he is interested in gaining and he will become interested in the object and will desire it.

At first one may be interested in accumulating money as a means of securing satisfaction for other interests. As one labors to accumlate wealth, his interest may be transferred from the things the wealth will secure and, through association, may become attached to and centered wholly on the accumulation of money as a means of securing satisfaction, as the traditional miser is attracted to and hoards his gold.

VOLUNTARY AND SPONTANEOUS ATTENTION

It is helpful to distinguish between voluntary and spontaneous attention.

Voluntary attention is attention directed to an object by an act of will, influenced by some motive other than interest in the thing attended to. A prospective customer may give this sort of willed attention to an article because of a request made by the salesman. Perhaps the salesman has assured him that the article will be a satisfactory means to the realization of some purpose in which he is interested. For example, the salesman may claim that the article will save expense and prevent losses. If the customer finds in the article nothing to warrant the salesman's assertion, he does not become interested in it and his attention soon wanders from it.

If the selling talk and demonstration of the salesman lead the man solicited to discover in the article a promise of bringing about the saving claimed for it, he will become interested in it and his attention will remain fixed upon it for some time. To hold the attention when it is once secured, the salesman must continue to develop interesting points, and thus lead the customer to discover in the object a growing promise of making the desired saving. This spontaneous, or nonvoluntary attention, held by the developing interest in the object, is what the salesman must secure, if he is to be successful.

Expectation of securing satisfaction arouses vol-

untary attention. Progressive satisfaction of the expectation leads to spontaneous attention.

That is attended to which seems to concern the satisfaction of the aims, purposes, interests, or instincts which at the time are more or less clearly in consciousness. Passive attention of an instinctive sort is given to intense, moving, pleasant, and unpleasant stimuli, to those which arouse curiosity and those which have a rhythmic character, etc. The various instincts and interests and their part in influencing conduct will be discussed later.

We give spontaneous attention to a thing we are conscious of being immediately concerned with. Such a thing takes on the aspect of being interesting in and of itself. It requires no effort to attend to such things.

Voluntary attention is given to a thing which is not in itself immediately interesting, but on the ground that it may concern, or is believed to concern, the future satisfaction of some interest. Such attention is very fatiguing. The ability to give attention of this sort, which is sustained for any considerable length of time, can be developed only by a rigorous course of training.

The power of giving sustained voluntary attention is the ability which enables one to direct his efforts persistently and unswervingly toward the attainment of some aim or ideal. The end to be gained is the motive which gives the trend to conscious activities.

Things thus attended to through voluntary attention tend to become immediately interesting. The interest is transferred to them through association. Henceforth they may arouse spontaneous attention.

Tasks which were at first uninteresting or positively disagreeable, may thus become interesting. The business man will finally come to turn with pleasure to tasks which originally aroused a feeling of repugnance. A knowledge of this fact may do much to encourage one to put forth the initial efforts required to perform certain unpleasant tasks connected with new work he is undertaking.

The idea of taking up a new task arouses a feeling of repugnance. The first efforts are put forth with reluctance. Persistence in the efforts tends gradually to overcome the antagonism felt for the task. The work done grows accordingly in efficiency. One should accustom himself to taking up new tasks that seem uninteresting with the consciousness that the worst will come first, and will soon be over. It is like a cold plunge. The first contact with the water is painful, but the final result is stimulating.

There is a rhythmic rise and fall in the effectiveness of attentive effort. As the power of attention wanes, the task may come to seem irksome. There is a tendency to yield to distracting influences. Under such circumstances, if one can hold himself resolutely to the task, he will find his efficiency again increasing with the rising wave of attention.

In order to accomplish things worth while, one

must be able to put forth a persistent effort to attain a remote end. He must have the ability to resist the distracting influences which tend to lure him aside. Such ability can come only through the formation of habit, as was previously explained.

FOCUS AND MARGIN OF ATTENTION

The focus of attention is the spot light on the stage of consciousness. When an idea is in the clear central light of consciousness it is said to be in the focus. Surrounding this center of clear perception are ideas of which we are but dimly and vaguely aware, if we are at all aware, that they are in consciousness. These are known as marginal ideas.

The reader can make clear to himself the distinction between the focus and margin, by practicing introspection. He will find that, as he reads, the focus is filled with what he is reading. There are, no doubt, ideas in the margin of his consciousness at the same time, which he can become conscious of, if he pauses to notice them. He may find among these ideas the ticking of a clock, the sound of people walking or talking in the house, the noises of the street, etc.

Ideas not attended to do not get into the clear center of consciousness, but remain obscurely in the margin, and soon drop out of mind.

The mind is focused on the idea to which it attends. Such an idea becomes clearer and remains longer in consciousness. Close attention to an idea makes it more likely to be remembered. By attending to an idea we bring it about that the ideas associated with it will come next into mind.

One can not give concentrated and effective attention to more than one thing at a time. However, one can get along fairly well in doing some task which he has made habitual or familiar through practice, and which as a result requires but little attentive effort, while, at the same time, his attention is focused on some unfamiliar, or difficult task which requires delicate adjustments to meet new conditions.

One can attend to an end to be gained and at the same time compare, criticise, choose, or use, means fitted to gain the end. But in any case when one attempts to attend to things which are not parts of one general process, or are not closely related to each other, the attention will alternate between them. Neither can get the effective attention which either alone would receive. Divided or distracted attention results in weak feeling, feeble impulses to action, and indecisive action.

EXPECTANT ATTENTION

Some of a magician's success comes from baffling the eye of the spectator. A greater part of it comes from diverting the attention from significant or essential things, and centering it, by suggestion, on features which do not reveal the true explanation.

The magician also creates a state of expectant attention. By carefully planned and skillfully employed suggestions, he works the spectator up into a sympathetic state of mind. He leads the onlooker

to expect vividly that the result he proposes to attain will be secured by the means, or process, he pretends to use. Criticism has been forestalled by predisposing to belief that the result will come in the way and form specified by the wonder worker. This belief fills the mind of the onlooker so fully that he sees what he strongly believes he will see.

A preconception of the intellectual sort will warp observation and judgment. A practiced reader does not readily see misprints. He overlooks them easily, even when looking for them. One standing on a crowded street looking for a friend to come along, may believe he sees him many times before he really appears. He may mistake for his familiar friend, men who are very unlike him.

Expectant attention often leads one to misjudge the real qualities of objects presented for his consideration. One sees what he expects to see. If one approaches a proposition in a skeptical frame of mind, he finds things which arouse suspicion and exaggerates their importance. If one is confident that everything will turn out all right, he is less critical. We prejudge the article favorably. Our mind is colored by the satisfaction we expect to receive. In this state of mind we are likely to overlook weak points, and see only the good ones. Good will as a business asset is largely a predisposition to look for satisfaction.

A strong desire, mingling with a strong feeling of confidence, often leads one to act without giving due

consideration to factors indicating the wisdom of another line of action. The fraudulent advertisement, or selling proposition, creates and takes advantage of such an uncritical state of mind. Attention is centered on some strong claim, or alluring promise. Desire is aroused. The mind is filled with a foretaste of the satisfaction which will result, if the attractive promise is made good. The person is made to believe that he is in danger of losing the golden opportunity, if he does not act at once. In such a state of mind, the weak features of the proposition do not receive proper consideration.

ATTENTION DETERMINES THE DIRECTION OF THINKING, FEELING, AND ACTING

Attention is the controlling factor in consciousness. The line followed by attention determines the course of thought and action. Several ideas may be in the margin of consciousness at the same time. They may be presented through the senses or revived by association. Only the one among these ideas to which attention is directed will get into the clear center of consciousness. The ideas which do not receive attention soon drop out of mind. The idea on which attention is directed remains longer in consciousness than it otherwise would. It becomes more clearly perceived, and becomes the dominant factor in determining the trend of association. Various ideas, associated with the one the attention is thus focused upon, may come more or less clearly

into consciousness, but the one of these which the attention selects will in turn become dominant in the train of thought.

In selecting the ideas which will come into mind, the attention controls the feelings which pervade consciousness, and the choices it makes, or the acts of will it performs. In more technical language, the attention, in exercising its selective function, controls the direction of thinking, feeling, and volitional acting.

The above applies to conscious processes in which association alone is depended upon to supply the ideas which come into mind. The conditions are modified somewhat when the salesman is presenting arguments and making suggestions to action. The arguments and suggestions displace ideas which would naturally come through association alone. But the arguments and suggestions have influence in controlling conscious processes and behaviour, only as they are selected by the attention.

ACTS OF WILL, OR IDEO-MOTOR ACTIVITY

One performs, as a matter of course, any act upon the doing of which he focuses his attention, unless he is prevented from doing it by some idea opposed to doing it, which is at the same time present in consciousness. Such a preventing idea is known in psychology as an inhibiting idea, and the prevention is known as inhibition.

The reader can readily find illustration of the motor tendency of ideas. Let him recall a recent trip to a store. Suppose he vividly imagines himself going to a store to make a purchase. If he tries to picture to himself in detail the actions involved, he feels himself actually beginning to perform the motions required to open the door, examine the article, etc. He will feel tendencies to activity in his vocal organs as he imagines himself speaking to the clerk.

The idea of performing an action tends to work itself out into action, that is, it is also an impulse to action. The ideas of purchasing which a salesman puts into a customer's mind are impulses to make the purchase.

Let us consider an example of an impulsive act which is fully performed. If one sees a child about to walk in front of a rapidly approaching car, he will reach out to pull him back. The act will be performed impulsively without stopping to think about

it. The thing seen arouses a strong feeling and suggests an act felt to be demanded by the situation. The impulse to perform the act fills consciousness so that all ideas of acting otherwise are excluded. In such a case the act is performed without other act of will, or volitional fiat.

The following illustrates how an inhibiting idea prevents an impulse from passing over into action. If one saw a child fall into deep water, he would feel a strong impulse to jump in to rescue him. If he could not swim, the situation would suggest to him the uselessness of carrying out the impulse. The idea of the uselessness of the act would doubtless prevent him from performing it. Such a preventing idea is technically known as an inhibiting idea. An objection which prevents a customer from closing is such an inhibiting idea.

ACTS OF WILL INVOLVING DELIBERATION

When two or more different lines of action are open to us, we may find it difficult to choose between them. Suppose it is a question whether I shall accept employment with another firm, or remain with the one for which I am now working. Each position has certain advantages and disadvantages. To bring these clearly into view, I endeavor to estimate fully the consequences which will follow upon each line of choice. Among them would be the prospects for permanent employment, increase of earnings, promotion, etc. The advantages of accepting the new position are compared with the advantages of

the present employment. Finally, I come to the conclusion that one position offers, on the whole, more desirable prospects than the other. I turn my attention from the less attractive alternative and fix it on the more desirable one. In so doing the decision, or act of choice, is made. I accept the position which I have come to regard as the better.

Deliberation between alternatives is necessary for deliberate action. But carried too far, it paralyzes effort. The active, energetic, practically successful type of man is one who makes sure that all the essential facts bearing on the situation have been given due consideration. He then cuts loose from all but one line of action accepted as the most desirable. He concentrates all his energies on carrying out the chosen course.

THINKING

The line of development which mental processes follow is determined by a more or less explicit aim, or purpose, which the person desires and strives to realize. Thinking takes place when one becomes conscious of a not immediately realizable end he desires to attain. The thinking takes the form of casting about for ways and means of attaining the desired end.

When one encounters an obstacle to the attainment of a purpose, a state of stress or effort is aroused in his mind. The anticipated attainment of the desired end arouses a feeling of satisfaction and striving toward the end. The less satisfactory present state, contrasting with the desired one, arouses a feeling of aversion, or striving away from it. In a consciousness of obstructed attainment of purpose, a state of mingling desire and aversion is thus found. A feeling of hostility to the obstacle is also experienced. This stimulates the effort to get around the obstacle, or overcome it, or even to destroy it. One has reached a thought crisis which demands clear and effective thinking, rather than blind yielding to any one of the various impulsive feeling aspects of desire, as the state as a whole is generally called.

Any activity is said to be interesting, or to arouse a feeling of satisfaction, when it awakens within us

the feeling that we are accomplishing something worth while; whether the "something" is very clearly defined or not. A feeling of interest is aroused by the consciousness of making progress toward the attainment of a desired end. The feeling of interest is a warming up to the activity, and at the same time a propensity to continue the activity which promises to satisfy the interest. The feelings of aversion and hostility lose in strength as the feeling that one is "getting warm" and the foretaste of the anticipated satisfaction grow stronger.

The desired end may be near or remote in the order of events. When the end is remote, it may be necessary, in order to attain it, to formulate many nearer ends which are subsidiary to it. The remote end then serves as a guide, or norm, in formulating the nearer ends, and in correlating and co-ordinating the efforts to attain them.

The efficient worker devotes his efforts continuously and persistently to the things and aims which he believes will play an important part in the attainment of his larger purposes. Efficiency requires that the non-essentials be eliminated. It demands that our aims or purposes be appraised according to the contribution to well-being that may be secured by attaining them. The efficient person cultivates a knowledge of, and desire for, the things worth while. He works to attain the things which give the richer and more enduring forms of satisfaction.*

*See discussion of "Well-Being or Self-Realization."

Thinking always has a purpose or end in view. This purpose is to secure satisfaction for an instinct or interest. The origin and nature of the various interests, and the different lines of activity in which they seek satisfaction will be discussed later. The end which is held in view in thinking is felt to be desired. The end which it is desired to attain through the thinking processes is to bring about such an ordering of conscious experiences as will best satisfy the awakened interest or felt need.

Thinking occurs only when one becomes aware of an obstruction or hindrance to securing the satisfaction of the interest or need. There is the consciousness that one faces a problematic situation which must be solved before a desired end can be gained.

The problematic situation may consist essentially of the awareness that the end is not clearly enough comprehended and formulated and correlated with other ends to permit one to work definitely and efficiently toward its attainment. For example the problems of promoting welfare work among employees are largely of this character. Efforts along this line are often largely ineffective, because the one putting them forth does not clearly and adequately apprehend what definite ends must be attained in order that the welfare may be promoted satisfactorily. The ideal in doing welfare work should be to promote the harmonious satisfaction of the various interests of the employee involved in a fully developed personality. Success in the work

will involve seeing to it that the employee has such incentive, wisdom, means, and opportunity as will enable him to secure such satisfaction.

If the purpose of the thinking is to overcome the difficulties in the way of accomplishing a definite mechanical result, or of performing some act such as selling an article, the problem may consist in selecting appropriate means and in employing them skillfully in the attainment of the clearly formulated purpose.

The first step in effective thinking and acting is to formulate and find answers to definite and pertinent questions. What is the end, or purpose, or aim, or goal, I wish to reach? What is the character of the obstacles that have obstructed the flow of my activities? Will this, that, or the other suggested answer be of assistance in solving the perplexity?

When one has clearly perceived his problem, the next step is to make a careful analytic search for the elements which have a significant bearing on the solution. The criterion for the selection and rejection of materials available, is their fitness for use as a means for attaining the desired end. The features of the materials which make them fit for this use are the qualities which give them significance for the end in view. The next step is the selection and arrangement of the significant features in such a way that they will contribute to the realizing of the end in view.

In the process of thinking, the interest or purpose dominant in consciousness at the time, through the

form of activity known as attention or volition, exercises a selective control over the stream of thought. The interest exercises this selective control by determining on which of the various ideas coming into the margin of consciousness the spotlight of attention shall be focused. When this control is being effectively exercised, only such ideas are received into the clear center of attention as are believed to be relevant in some way to the end which the thinking is endeavoring to gain. It becomes interesting for this reason.

The interesting idea which is received into the focus of consciousness is more vividly perceived and remains longer in mind than the marginal ideas which are merely accorded a passing glance. The interesting aspect thus held in the clear center of consciousness becomes dominant in determining the ideas which will next come into mind through association.

As the ideas recalled through association appear above the threshold of consciousness they are noticed. If they appear to have no bearing on the business of the moment, they are given no further recognition. They remain withering in the dim margin for a brief moment, as they drop out of the mind.

If the idea occurring seems to have a bearing on the desired solution, the attention is fixed upon it. It is critically examined and fitted into its proper place in the thought system which is being con-

structed. If the solution is not readily reached, an attempt is made to hold all apparently relevant ideas in the background of consciousness. In this way there is built up a fringe, or constellation, of ideas mutually helpful in suggestive force, in the hope that one, or all of them, will finally suggest the solution the judgment approves.

When an interest or purpose thus controls the processes of thinking, it lapses into the background of consciousness. The attention is directed to the ideas that appear in the foreground, discriminating, measuring, and accepting or rejecting them. But the purpose must not be allowed to lapse entirely out of mind or thought will be deflected from its guidance.

The purpose of controlling the development of conscious processes, remains in the background, but its influence pervades and gives coherence to the flow of thoughts, feelings, and strivings. Figuratively speaking, it is the commanding officer viewing, and appraising, and ordering the whole field of conscious activities. Though it occupies a position on the field of action it is aloof from the various activities and vicissitudes of the actual contestants. The associative and logical thought processes are employed merely to serve the purposive processes of feeling and striving, just as the soldiers and the equipment of the army are used as a means of accomplishing the aim of the general.

In active thinking, as has been said, one has a

definite aim, or purpose, or problem in mind. He is searching for a means of gaining the end or solving the problem. Success in overcoming the difficulty encountered depends absolutely on the ideas which come to the mind through association. Success will depend upon the care and skill previously exercised in organizing knowledge into association systems.

Efficient thinking and doing must be founded on and spring from efficient learning. The process of learning efficiently was previously explained. Such learning consists in organizing the materials of knowledge into such forms of associative systems as will contribute most satisfactorily to the use of the materials in gaining satisfaction for the interests concerned with them. In such learning, the interest to be served by the organization must be kept alive in the margin of consciousness and must be firmly associated with the organized elements with which it is concerned, by concentrating attentive effort on firmly establishing the association.

The truly efficient man is the one who can see problems where others are unaware of them. He has cultivated a questioning and critical attitude of mind toward the affairs with which his activites are concerned. He is able to bring a well organized intelligence to the solution of the problems he thus discovers. Such a man has real initiative and brings about improvement and progress. Efficiency in business involves first, the adequate formulation of the ends to be striven for. One must then locate

the obstacles in the way of attaining the ends. He must clearly perceive, and select, and skillfully employ the best means available for overcoming the difficulties and gaining the end.

In order to think and act adequately about a situation or proposition, he must have developed keen powers of discernment which enable him to select focus of attention. Right thinking and acting require that elements not relevant be disregarded, and that relevant matters be kept in mind until the means or way to the end is found. If one has previously fitted himself to handle the situation and keeps his attention concentrated on significant qualities or points, he will find coming into mind, through association, ideas which will guide him to a wise course of action.

One can have fertility and resourcefulness in thinking, only as he has previously established an extensive system of associations organized in accordance with their significant features. Fortunate is he who can see the significance of things, and can recall them when their significance will make them useful! The thinking of one whose knowledge is so organized will be significant rather than superficial. He will not be led off into inconsiderate action by the first plausible suggestion which occurs to him. He will be freely supplied with suggestions along alternative lines, which will lead him to carefully examine and appraise the superficially plausible suggestion.

When the suggestions do not come through the

associations previously established, one should undertake a systematic search for them. This search may take the form of carefully planned experiments or investigations of some sort. Or one may seek help in the experience of others through conversation or reading.

The solution of the problematic situation may thus demand that one acquire new learning. To avoid the uncertainty and tremendous loss involved in learning mainly by the method of blind trial and error, one should give an intelligent and searching investigation to the factors which may have significance for the solution of the problem. The number of failures in thinking and acting can thus be greatly reduced, but not entirely eliminated. The wider and more intelligently organized the past experience has been, the more effectively can be brought to bear on finding a way to overcome the difficulties of a novel situation.

TEST OF TRUTH

The more clearly one has centered his attention on methods of procedure, and has discriminated them from their context, and associated them with the general conditions under which they can be applied, the more effectively he will be able to bring the previously learned methods to bear in dealing with a novel situation.

Novel problems must be solved in terms of previous experiences, by combining or using the elements of such experience in new ways. One must search either his own experience or the experience of others for factors bearing on the solution of his problem. It is a difficult task to select the few significant factors in the problematic situation from the the significant aspects and hold them clearly in the many irrelevant features which are manifested along with them. When these are found it is still more difficult to form the right hypothesis, or theory, of dealing with them, than it is to determine whether we are on the right track to the solution, after the hypothesis has been formed. The only method of procedure is to critically examine the various possible solutions suggested. The most promising of these solutions should be selected as an hypothesis. By study and trial, or experimentation, one must endeavor to ascertain whether the tentatively accepted

hypothesis offers the best way out of the difficulty. The test as to whether the true solution has been reached is whether it will guide us satisfactorily in dealing with the elements of experience so that we can attain our purpose. If we find that it works satisfactorily we accept it. If not, we reject it.

Whether a suggested solution, or tentative hypothesis, is correct can be determined only by testing it in subsequent experience. However, one can often arrive at a high degree of probability by carefully thinking out the consequences that can be foreseen as likely to follow such an attempt at verification in experience. In imagination, one can anticipate the results of experience. If the situation does not involve too novel elements, he can reach a reasonable certainty that his forecast of consequences is essentially correct. This is the process of verification; whether we are searching for general notions which will enable us to deal with presented materials, or whether we are searching for a particular means of attaining a general end. One by imaginatively testing his solutions in experience can form a conclusion that they are probably true. He should not make the mistake of regarding them as certainly true, until they have been actually tried out in experience.

JUDGMENT AND REASONING.

When one discriminates the various thought relations among the elements of experience he is said to pass judgment upon them. So also when a choice is made and a decision is reached after deliberating over the consequences of following different lines of action, the act is known as a judgment.

The function of judgment, as an element in the process of thinking, or reasoning, is to notice the significant relations existing among the objects of thought. Among the significant relations are resemblances and differences, the relation, of means to end, individual to class, cause and effect, the estimation of merit or value, and the discrimination of various other relations between ideas.

One passes judgment on a thing when he decides that it's value is equal to or greater than that of some other thing, or when he decides that he can use it to bring about an effect he desires to produce, or concludes that a certain effect has resulted from a cause of such and such a character, etc.

The salesman's task is largely to induce the man he solicits to pass judgment that the article offered is the best available means of securing some end which he desires to attain. He will then desire the thing as a means of attaining the desired end. In bringing this about the salesman has produced a

state of conviction or belief in the customer's mind.

Reasoning involves a series, or chain, of judgments. There are two forms of reasoning, known as induction and deduction. One is reasoning inductively when he derives general principles or conclusions from observed facts. If the salesman can show that this, that, and the other business man belonging to a certain class has found it profitable to use in his business the article offered for sale, he arrives inductively to the general principle, or conception, that the article will be found profitable by all men of that class.

The salesman can apply deductively the general principle thus established inductively. He does so if he convinces the men he is soliciting that the circumstances, conditions, and methods of his business will rightly bring him under the general class of profitable users. If the customer is convinced of this, he will conclude that what has proved profitable to others similarly situated will also be profitable to him. His belief is founded on his acceptance of the truthfulness and validity of the evidence on which the general principle of profitableness was established, and the conviction that the circumstances in which he finds himself, will rightly put him in the class of profitable users.

It may be well for a salesman to understand the method of procedure in deductive and inductive thinking, but he will hardly find it profitable to apply them in the formal way above illustrated. However,

the salesman should understand that what is known as creating desire is generally merely showing that the object is an important member of a class of objects habitually regarded as desirable.

Our satisfied customers are our best advertisement, is a statement which aims by suggestion to cause the hearer, or reader, to make the inference and draw the same conclusion, which was reached above by following formal logical processes more closely. Such a suggestive statement is usually more effective than cold logic in influencing to action.

Such a suggestion may be backed up by a few reasons why. Even when such is the case, the one who is influenced by it is not moved by formal logical processes to make a fully reasoned choice. He is rather moved by suggestion to perform an act of rational imitation. This subject is developed more fully in discussing suggestion and imitation in the "Psychology for Business Efficiency" and the "Psychology of Advertising."

It must be remembered that thoughts originate, or grow, only from one's own experience, past and present. One is skillful in judging, as his past experience has been rich and varied, and skillfully organized and assimilated. One, so prepared, can readily select the right idea and apply it accurately in solving the problems at hand.

The genius is one who clearly perceives the significant aspects and relations of things and links them together, and to the related parts of his experience,

by helpful associations. The expert has reflected on experience, has studied and classified actual and hypothetical cases, and has formed useful association systems. He thus has many fully formed conclusions and principles of action stored away in his memory. As soon as the essential facts of a new proposition are clearly established, he at once recognizes it as belonging to a class with which he is already familiar. Without apparent consideration, or deliberation, the expert, thus prepared, can immediately and confidently give a decision on matters of the utmost importance. He has previously gone through the processes of investigation and deliberation. He sees his way clearly at once, and is ready to act confidently in accordance with his judgment. A selling appeal addressed to an expert should take a different form from one addressed to an inexperienced buyer.

BELIEF AND ACTION

Deliberation results normally in conviction, belief, and action. If I am convinced, or believe, that it will rain, I shall carry an umbrella; unless, taking everything into consideration, I am convinced, or believe that getting wet will involve less inconvenience than carrying the umbrella. In either case the belief determines the action.

I am always ready to act along the line which I believe will contribute most to the realization of the purpose which at the time seems to me most im-

portant. Because it seems most important, my attention is fixed upon it, or rather it holds my attention.

Deliberation and reasoning aim to eliminate rivalry and conflict among impulses to action. Deliberation is brought to a close when order and harmony are established among the impulses to action. When a decision has thus been reached, one refuses to attend to suggestions arousing impulses to act along an opposing line.

In attending to the acts appropriate to the conviction or belief established, he sets the switches for their performance. At last, when all preparations are made, and the judgment declares that the time and circumstances are ripe for the believed in action, and that the line is open, then the act is performed as a matter of course.

PART III

FACTORS WHICH DETERMINE THINKING, FEELING, AND ACTING

INSTINCTS OR PREDISPOSITIONS

Some parts of the following discussion of interests may seem very difficult to one who has not studied psychology. The relative importance of the subject is fully as great as its difficulty. This fact should stimulate the reader to put forth the effort necessary to grasp it. It goes to the core of the motives which influence action. The mastery of this part of the subject should helpfully illuminate the work of the salesman. It is of fundamental significance in the widely prevalent effort to rightly motivate education, vocation, and other activities of life.

"The Classification of Interests", and most that follows it, will be easier. The application of psychological principles in the practice of salesmanship will become clearer if one has a thorough understanding of the interests and the part they play in determining the actions of men. The significance of the harder parts of the book will be better understood on a second reading. If the psychology of salesmanship were easy, many books would have been written on the subject long before this.

Men are moved to action by impulses which have their roots in instincts. These instincts originated in very remote evolutionary processes because of their usefulness in promoting the welfare of the individual, or of the community to which he belonged, and in perpetuating the race. The social reformer, the politician, the teacher, the preacher, the advocate, or the salesman can influence men only by appealing to emotions, sentiments or interests developed from these instincts.

The salesman who attempts to awaken interest and desire will be greatly assisted by understanding the origin, nature and significance of these mental processes and the part they play in influencing the actions of men. One who has this knowledge will be better able to arouse interest and desire for his proposition and to take advantage of their impelling force.

An eminent authority has defined an instinct as an inherited, or innate, mental and physical predisposition to experience an impulse to attend to certain things, to feel desire or aversion for them, and to act in a predetermined way in regard to them. An instinct is complicated, purposive behaviour which has not been acquired or learned through educational processes.

From the physiological point of view a predisposition is a complex constellation of nervous paths. These paths may be fully pre-formed or partially pre-formed. That is, they may exist in a fully de-

veloped form previous to experience, or they may be only partially pre-developed and hence require experience to perfect them.

On the psychological side a predisposition is a capacity and tendency to feel interest in and strive for. Physical predispositions may be fully pre-developed or partially pre-developed.

On the psychical side the predispositions have various qualities, attributes, or characteristics which distinguish the various processes of being interested. In their developed form they take on the differentiations which are distinguished in and predicated of the conscious processes. The qualities or characteristics observed in objects awaken certain correlated mental processes of feeling, interest, and striving which have distinguishable qualities or characteristics.

When one becomes aware of the object which is the stimulus to which a certain form of instinctive behaviour is the appropriate response, he feels a strong impulse and desire to perform the instinctive act. When one first performs the instinctive act he is probably not aware of the purpose which his behaviour serves to attain. Even if he has a certain sort of vague, innate fore-knowledge of the general end to be gained, it is evident that the awareness of the purpose does not determine the form of the behaviour. There is no deliberate effort to determine what to do, or why to do it, or what is the best form of behaviour under the circumstances. When such

factors enter into the performance, the act is not a perfectly developed instinct. It results rather from more or less definite instinctive tendencies and capabilities.

The instinctive endowment of man consists largely of general tendencies and capabilities. Even such perfectly developed instincts as he has, cease to be blind as one grows in experience. With the growth of experience, the real purpose of the instinctive act comes into view and determines the choice of means to attain it. The original instinctive behaviour, or reaction to stimulus, is greatly modified. Such modification is often necessary to adapt the act properly to the circumstances in which the individual finds himself. This is true largely because the conditions of human life have changed greatly from those of the remote evolutionary period in which the instinct originated.

Authorities vary greatly in the number of instincts they enumerate. As was said before, some of the innate tendencies and capabilities of human beings are not manifested in the form of perfectly developed instincts. They require development through education and experience. However, most authorities will agree in the broad view that man, as the result of the inherited structure and tendencies to development in his psychical and physical organism, is predisposed to do a much larger number of things than are the lower animals.

ENUMERATION OF INSTINCTS

Taking the broad view, the following are among the more important instinctive capabilities or tendencies:

Appetite for certain foods and disgust for others, anger, hate, affection, rivalry, emulation, jealousy, shyness, fear, teasing, self-assertion, modesty, sexual love, parenthood, desire for approbation, sympathy, imitation, play and recreation, fighting, nomadism, agriculture (making things grow), hunting, constructiveness, secretiveness, inquisitiveness (curiosity (or desire to know), acquisitiveness, the predatory instinct, artistic interest, respect for others, gregariousness, co-operation with others, loyalty to group interest, subordination to superiors, morality, and religion, or self-subjection to the Divine Will.

The following are brief illustrations of the sort of behaviour to which some of these instincts lead. The setting hen feels that she simply must set, even if the nest is empty. Whether a brood of chickens will result from her setting evidently does not influence her act. The instincts in a human being can not long remain as "blind" as this. However, the boy may unquestionably follow an impulse to collect articles of no real value. So one sex is attracted to the other, and so the man may feel an overwhelming impulse to go fishing, or hunting.

The innate predispositions play an important part in ordering the affairs of life. One instinctively fears whatever threatens to prevent the attainment of a desire.

The consciousness of being alone in the dark or in a vast wilderness may arouse an instinctive fear, which is none the less genuine, though one recognizes that there is nothing to harm him. We hate a person who maliciously hinders the attainment of our purpose. Emulation impels an individual to rival the achievements of a superior. Rivalry, developed to excess, grows into envy, jealousy, anger, and hate. We are jealous of persons whom we regard as our rivals. We envy them their success. Acquisitiveness leads to competition and rivalry. It leads to envy, when the thing desired belongs to another. One is envious of a person when he covets his goods, and may become jealous of him as a successful rival for the goods.

Secretiveness impels one to conceal his business from others. Its instinctive character is shown by the fact that it often influences one when there is no real reason for concealment. Curiosity, or inquisitiveness, is interest in knowing. In business, curiosity, or interest in knowing about a thing, should be clearly distinguished from acquisitiveness, or interest in securing it. Curiosity may be made to lead to acquisitiveness, if proper advantage is taken of it. Combativeness may be dangerously strengthened by an extreme militaristic policy, or dangerously weakened by a peace at any price attitude.

Sympathy is the general instinctive tendency to experience an emotion perceived to be manifested in others. One responds as instinctively to the observed expression of an emotion, as he does to the object which is fitted to arouse the emotion, and for similar reasons. The instinctive imitation of the expression of the emotional state makes one aware of the nature of the state, by arousing a corresponding emotion in him. This emotion aroused through imitation is accompanied by an impulse to carry it out into appropriate behaviour. The person who experiences and responds to an emotion through instinctive imitation may be totally unaware of the stimulus which aroused the instinctive response in the person imitated. This has been a source of advantage as when the instinctive response has, for example, enabled one to escape a danger of which he was unaware. It may also lead to destructive panics and other detrimental acts. Through this instinct the enthusiasm and confidence of the salesman arouse similar feelings in his customer.

One instinctively reacts to the expression of an emotion which he has inspired in another. The suggestive force of one's own expression is reflected back to him and adds strength to his already strong feeling. As each one of a crowd is thus influencing and in turn being influenced by others, the emotions may be worked up to a very intense form. The sympathetic, reciprocating, cumulative spread of an emotion through imitation accounts for the fact that the

emotion a person experiences when witnessing a play as one of a large crowd is much greater than he would experience as the only spectator. The expression of pleasure or displeasure by the various members of an audience tend mutually to heighten each other. More will be said on this subject later.

Instincts do not appear until the necessary nervous connections have developed through bodily growth. No two children manifest exactly similar instincts. They vary in number, in relative strength, and in time and order of manifestation. All the instincts will appear sooner or later in a normal person, if a suitable stimulus is experienced when the nervous system has reached a proper stage of development.

In a general way, the human instincts have tended to adjust the individual to the necessary conditions of his existence. They enable him, independently of education, to make his environment contribute in some measure to the satisfaction of his needs.

In man the instinctive preadjustment has never attained to the perfection which it has reached in the lower animals. In the animals the instincts are ready made capabilities to perform certain acts. They are, compartively speaking, modified or improved but little by education. In man the instincts are largely tendencies and capacities which must be developed into capabilities and habits through education.

INSTINCTS REQUIRE EDUCATIONAL DIRECTION

It is not safe for the individual to follow blindly the guidance of his native impulses. Pugnacity may be taken as an illustration. The fighting spirit, as developed in some militaristic circles, is harmful to the interests of society as a whole. Yet there is no doubt that a refined and tempered form of the fighting spirit is essential to the attainment of great achievements.

An instinct may develop into a good or bad habit, or die out from lack of exercise. It may be so strong as to lead readily to over development. Or it may be weak and require strong stimulation and much exercise.

As a result of stimulation and exercise the instincts are correlated and developed into habits. In their developed forms they manifest themselves as interests and temperamental traits of character.

An instinctive tendency may fail to develop into an element of character, because of the lack of an appropriate stimulus, or of an opportunity to perform the act: or the failure to develop may result from the fact that one yields so fully to some one instinct that he neglects to exercise others. Or the instinct may be forcibly repressed. While a merely neglected instinct may die out, one that is forcibly

repressed may merely become dormant and manifest itself in some foolish or perverted act later in life.

It is the business of the educational agencies, among which the parents occupy a very important position, to see that proper stimuli and opportunities for exercise are furnished to each instinct when it ripens. In this way the instinct may be developed into an interest or trait of character useful to the individual.

The instincts are often in rivalry with each other. The educator must see that they are properly harmonized. He must also see that the person is furnished with knowledge and incentive to guide his development along the lines of his real needs.

The mental constitution of an individual has taken its form through the development in the evolutionary experienec of ancestors. This constitution includes the rather specific instincts we have mentioned. It also includes more general innate capacities and powers which are more variable in their manifestations in individuals than the more specific instincts.

Among such qualities we may mention, as examples, the capacity for more than ordinary achievement in science, business, mathematics, politics, painting, music, etc. The possession of such capacities apparently does not result entirely from the inheritance of a practically perfect nervous organization. They appear to be, in large part, innate

mental tendencies, qualities, and capacities. The inborn capacities must be developed into capabilities through education. The born salesman needs education to fully develop his ability. This inherited mental constitution determines largely the trend of the development of the nervous organization acquired during the life of the individual. An instinct acquired during remote evolutionary experience is a trace of that experience persisting in the mental and physical constitution of the individual. This innate trace of remote racial experience is comparable to a memory of such experience. Through these traces the lessons of past experience indelibly impressed on the mental and physical constitution of the individual are operative in guiding him through present experience.

In the instinctive striving there may be, previous to actual experience, some faint perception of the end at which the impulse aims. In the fear instinct this preperception may take the form of a very imperfectly defined "Danger—there! This way to escape!" In carrying out an instinct, the stimulating object is regarded as a thing with which one is greatly concerned. There is certainly present also the feeling that something worth while is being gained by the behaviour.

The awareness of why the act is worth while could arise only through the awakening of innate knowledge along with the innate feeling and impulse.

The traces of previous experience preserved in

the mental constitution and manifested as instincts work through more or less perfectly preformed pathways of neural discharge. The less perfectly or less completely these pathways are organized, the more important is the function performed by the traces of past experience existing in consciousness, and the more necessary it is to develop intelligence to guide in the response to the stimulus.

MODIFICATION OF INSTINCTS

Instinctive behaviour may be analyzed into the following important elements: The perception of an object which serves as the stimulus; the emotion and impulse aroused by the stimulus; the form of behaviour which results as the response to the stimulus.

One may learn to improve the instinctive response to a stimulus. He may learn to discriminate the circumstances under which he should make the response, from those under which he should not make it. He may, through experience, associate with the object which first called forth the response, another feeling and impulse which will lead to a different response. "The burnt child dreads the fire." One may learn to respond instinctively to objects which at first failed to arouse such a response.

An instinct may be modified by associating with the object and the feeling it arouses another form of response. The response to the feeling and the impulse aroused by the stimulus is shunted off into another line of action. In this way one may be led

to make the conventional rather than the primitive response to the stimulus. Actions are thus made to conform to the forms of conduct prescribed by society. The sex instincts, for example, require such modification.

Instincts may be modified by refining, sublimating, generalizing, and co-ordinating them. The gregarious, co-operating, and fighting instincts and those of emulation, play, etc., are thus modified by properly conducted sports. One who fights for victory according to the rules of the game is likely to become one who fights the battles of business and political life in accordance with the principles which should govern conduct in those spheres.

WILL TO LIVE

In the earliest form of conscious life there was probably simply a vague consciousness of impulsive-process-going-on and of satisfaction-accompany-the-going-on. It was the will to live seeking and finding satisfaction in the conscious-impulsive-satisfying-activity which constituted the process of living.

The general will to gain satisfaction through carrying out impulse has come, through the process of evolution, to manifest itself along many different lines. The various instinctive predispositions serve to guide impulsive activities into the lines along which they most profitably seek for satisfaction. They are differentiations of the original capability of experiencing impulse and of feeling satisfaction in carrying it out. As such they must be dominated and correlated by the general will so that they will work together harmoniously, each contributing duly to the satisfaction of all.

INSTINCT OF SELF-REALIZATION

We have found that we can trace one all inclusive, all pervasive instinct manifesting itself in the various special instincts. We may call this the instinct of self-realization. It is essentially a process of seeking satisfaction through carrying out impulse.

In one aspect, the instincts are processes of react-

ing to the environment. The form of the reaction is determined by a correlation existing between certain objects of consciousness and certain qualities in the physical and mental constitution of the individual. In another aspect, since the behaviour resulting from the stimulus is determined by the psychical and physical constitution, this behaviour may be regarded as a form of self expression.

The instincts are predispositions to act in such ways as will best promote one's well-being, or self-realization. The instinct of self-realization works blindly at first, groping its way by mere impulse. As man's experience widens and as his intelligence increases, the character of this predominating instinct becomes more clearly revealed. It develops into an ideal of well-being. The ideal is that of a form of well-being to be attained by developing all one's capacities into capabilities of securing satisfaction and of exercising these capabilities, each with due regard to the other, and of safeguarding them.

Some of the instincts aim largely at making one's material environment subservient to the progressive approximation to the ideal of well-being or self-realization. Among them are constructiveness and acquisitiveness.

Other instincts, such as play, curiosity, and especially imitation, have for their purpose the improvement of well-being through giving a better mastery of the objects of both the material and social environments so that they may be employed more efficiently as means of securing satisfaction.

Some of the instincts concerned with the social environment are egoistic or seek for the well-being of one's self. Some are altruistic and seek for the well-being of others. Some are antisocial, others are pro-soical.

Among the egoistic or self seeking instincts are pugnacity, fear, self assertion, rivalry, shyness, secretiveness.

Teasing and the predatory instinct are antisocial.

The altruistic instincts are general pro-social. That is, they aim at promoting the well-being of others. Such are parenthood, sympathy, modesty, sexual love, respect for others, co-operation, gregariousness, loyalty, and subordination to superiors.

No man can come into being or develop his capacities apart from others. Born into collective life man's well-being must be brought about through co-operation with others, in collective life. The will to live in its various lines of instinctive development clearly aims at self-realization in the give and receive of association with others. The state of well-being aimed at is a state of social well-being in which each will profit in proportion to his service to others, and only as he renders such service. The supreme good is a common good, to be attained in a community, the members of which are mutually dependent and mutually helpful. One just as naturally feels regard for the collective welfare, as for his individual welfare.

The striving for self-realization is a striving for

such a condition of collective well-being as we have just explained. The ideal of self-realization has been formulated through co-operative experience and co-operative reflection on experience. It is an end not fully attainable, but to which we can always approach more closely.

Man is a social being with broadly diversified interests and concerns, as well as a marvelous machine for performing work. His well-being can be promoted only by providing opportunities and stimuli leading to the satisfaction of his various lines of interest. This fact should be kept in mind in planning welfare work.

MORAL INTEREST

The instinct of self-realization has developed into the interest of self-realization, which is known as the moral interest. This moral interest is an interest in well-being, or in well-doing, as being is in this sense a process of doing. In a condition of well-being, or well-doing, all of one's interests, both egoistic and altruistic, would be developed in proportion to his true needs. All of these interests would be satisfied with due regard to the well-being of the organic individual whole, of which they are characteristics. It is a condition in which one gains a harmonious satisfaction for interests which have been developed in proportion to needs.

Moral acts are acts which concern the social well-being. Acts which affect the efficiency of any individual member of society, affect the well-being of the

society of which he is a member. Society must see that its various members keep themselves in a condition to render efficient service, just as a person must see to it that his various organs are working properly. Hence society lays down rules to which the behaviour of the individual must conform.

The moral judgment is the judgment of society, which has followed and handed down, in tradition and custom the best judgments of the moral leaders of the past. This judgment voices the collective racial experience as to acts which tend to hinder or promote the individual and social well-being.

By our instinctive endowment we are sensitive to the praise and blame, or approval and disapproval of our fellows and conform largely to their will. Those who do not so conform are penalized in various ways. Through suggestion and imitation we accept the maxims and traditions in which are formulated the racial experience as to what is good or bad.

One gets his ideal of conduct as a suggestion from others. When he comes to see that this ideal aims at the true co-ordination of collective and individual welfare, he may strive to promote this welfare, regardless of the collective approval, or disapproval, of his acts.

The sentiments and impulses, which give force to the moral ideal in controlling conduct, have developed under educational influences from various altruistic and egoistic, instinctive tendencies. The moral ideal may thus be conceived as developing

from impulses and capacities which have their origin in the Eternal Consciousness or Divine Spirit which is manifested in us.

The Universal Will to Live manifests itself in all living things. Its impulsive force becomes manifested along the lines of the various instinctive tendencies. In our conscious experiences we become aware of these native impulses and capacities. As experience develops, intelligence furnishes guidance in efforts to seek satisfaction for them. But the form into which the moral personality develops is determined mainly by social agencies.

The instinctive predispositions have been developed in the course of evolution as a means of promoting well-being. They are tendencies to feel and act in a certain way in regard to things which concern well-being. When one becomes aware of this concern with a thing, he experiences a desire and an impulse to strive for it, or an aversion and an impulse to strive away from it, according to whether it concerns his well-being favorably or unfavorably. The person is said to have an interest in the things which thus concern well-being.

The things which concern well-being similarly are arranged in a general class. General lines of concern come to be recognized. Around each line of concern, of which one becomes conscious, is organized a system of tendencies to feel and act. The habits of responding to such classes of objects with co-ordinated tendencies to feel and act, are known as

interests. When an interest has been formed, as soon as an object is recognized as belonging to the general class, it arouses the desire and impulse characteristic of interest.

The individual is said to be adapted to his environment by his instinctive tendencies. However, these tendencies seem rather to be the agencies by which the environment is made to promote the satisfaction of the individual. The instincts act as guides before experience has been sufficiently developed to deal with things which concern well-being by furthering or hindering it. They guide one to the satisfaction of certain needs not yet felt to be such. Where the instincts are lacking in perfection or definiteness, consciousness steps in and undertakes to do what preformed structure has left undone, in the way of making the environment subservient to human interests.

Man grows gradually into a consciousness, or realization, that certain classes of things concern his well-being in certain ways. The ends toward which the instincts impel one come to be formulated as aims or purposes to be desired. The line which the development of the individual actually follows is a resultant, or mean, of two component factors. The two factors determining development are instinctive endowment and educational influence.

When the conscious realization of concern is awakened, it takes the form known as interest. Conscious processes are interesting when some ca-

pacity of the self is finding satisfaction in the activities. Man is impelled to action through a conception of himself as satisfied as the result of action. The foretaste of satisfaction, which arises from representing or picturing one's self as having gained the object, or attained the interesting or desired end, arouses the impulse to the action and leads to such a rearrangement of conditions as will bring about the anticipated satisfaction.

TWO MEANINGS OF INTEREST

The word interest is used in two different senses which should be distinguished from each other. In the wider meaning of the term, one is interested in all that concerns his need or welfare, though he may not be conscious of the concern. In this sense one may ignorantly do a thing contrary to his interest, if he is unaware of the effect the act will have on his well-being.

In the psychological sense, an interest is a conscious realization that a general class of things concerns one's need or well-being. The feeling of interest varies with the importance attributed to the thing as a means of affecting the well-being favorably or unfavorably.

The consciousness of favorable concern arouses a feeling of pleasure, a foretaste of the satisfaction to be attained, and a striving or impulse to attain it. This complex state is known as a desire.

The consciousness of unfavorable concern arouses

a feeling of pain, a foretaste of dissatisfaction, and an impulse of aversion, or a striving away from.

CLASSIFICATION OF INTERESTS

The experience of the race in working out the due co-ordination and satisfaction of the various interests has found that they may be dealt with most conveniently, in theory and in practice, when they are grouped in a few important classes.

In the fully developed consciousness, an interest as a motive impelling to action, will be found to have two aspects. In one aspect it is an interest in a special line of activity. In another aspect the special line of interest is a manifestation of the general interest in self realization which includes all other interests.

The all pervading and all inclusive interest in self realization or well-being, manifests itself in the moral interest. The moral interest is the interest in correlating and co-ordinating the special lines of interest. The special lines of interest include politico-legal, philanthropy, sociability, health, knowledge and educational skill, wealth, beauty, vocation, family and home and recreation.

The interests are the ends which the instincts serve, brought into clear consciousness, and developed into habitual lines of desiring and striving.

MORALITY—THE MAJOR INTEREST

The interest in general well-being, or in properly

co-ordinated satisfaction along the various lines of interest, is known as the moral interest. The feelings of interest which attach themselves to matters which concern general well-being, or self-realization, are known as feelings of oughtness, or obligation.

The feelings of rightness and wrongness attach themselves to acts which tend to further or hinder general well-being. These feelings are manifested at first as blind instinctive impulses. They predispose one to do the right act and not to do the wrong one.

Through educational development, which is guided by social influences, the feelings of obligation, or oughtness, tend to lose their blind instinctive character. As experience develops, one gains the ability to appraise the tendency of the acts to hinder or further general well-being. Wrong acts are seen to be acts which have bad results. Right acts are those which bring good results. However, the obligation feelings to which judgments of rightness and wrongness give rise, still retain their instinctively imperative character.

Goodness means fitness to promote well-being. A thing is good only as it is good for something. It is good only when it is adapted to serve as a means of attaining a good purpose. Goodness can be estimated only in relation to the end to be served. Good and bad things are things which have a favorable or unfavorable bearing on well-being.

The enlightened conscience aims at a progressively realized state of well-being, to be brought about through a happy adjustment, or co-ordination, and satisfaction of the egoistic interests, which have regard for self, and of the altruistic interests, which have regard for others. It aims to harmonize the various interests of the individual and the interests of society so as to achieve a higher and richer life for all. Conscience aims to bring the interests of the individual into harmony with the great social will, and with the Universal Will of which it is a manifestation.

Moral principles arise from the recognition that acts concern both individual and social well-being. They are general principles to which acts must conform in order to promote this well-being. They are rules for playing the game of life. The moral virtues are habits of acting in accordance with moral principles.

The principles to which acts should conform, in order that they may be regarded as moral, include, among others, honesty, truthfulness, fidelity, loyalty, justice, mercy, courage, industry, thrift, frugality, temperance, chastity, modesty. They are the principles by which impulses to action along the line of the various interests should be appraised, to see whether they should be held in check or strengthened.

PHILANTHROPY INTEREST

From the various predispositions to perform actions which promote the well-being of others has developed the interest in philanthropy. This interest has its roots in gregariousness, the parental instinct, the tender emotion, affection, sympathy, cooperation, loyalty to group interests, filial devotion, respect for others, self-subjection, religion, etc. It is the interest in rendering social service for which no service, or means of securing service, is to be received in exchange. This distinguishes it from business, which is the rendering of service for a consideration.

Many confuse philanthropy with the moral interest. However, philanthropy is merely one among several lines of well-doing with which the moral interest is concerned. The philanthropy interest must be co-ordinated and correlated with the sociability, health, education, wealth, beauty, recreation, vocation, family and home, and politico-legal interests, in accordance with moral principles. One is under obligation to develop and exercise his own capabilities along all these lines. He is also under obligation to provide, through exercise of his philanthropy interest, that others have opportunity and incentive to develop their interests along the same lines. The moral interest is coextensive with life interests.

POLITICO-LEGAL INTEREST

The politico-legal interest aims to render service to the individual and to society through organized co-operative effort. The political organization is the machinery employed for rendering this service. Through legislation the legal interest aims to enact the laws which will establish the form of organization which will be most efficient in promoting individual and collective well-being through co-operative effort.

The legal interest also aims to make laws which record the consensus of moral judgment, to establish judicial machinery to apply this judgment to concrete cases, and to provide for executives to enforce the judicial decisions.

FAMILY AND HOME INTEREST

The family interest aims at promoting the various interests of those for whom conjugal, or parental, or filial affection exists. The members of the family are interested in the home as a means of satisfying a great variety of interests.

Service to the home and family is the vocation of a large majority of women. It also makes large demands on women who have other vocations, and on all normal men.

The home interest embraces all the activities which aim at the well-being of the members of the home and all the things with which these activities

are concerned. The home and family interest is concerned with things pertaining to domestic economy and domestic art. Among them are wholesome and appetizing food, architecture, heating, ventilating, and lighting, domestic art, decorations, furnishing, sewing and various forms of household activities which it is hardly necessary to mention. The home interest embraces all the home activities which aim at the well-being of the members of the home, and all the things with which the attainment of this well-being is concerned.

SOCIABILITY INTEREST

This interest impels one to strive to secure personal recognition along social, civic, political, business, and other lines. It gives rise to the ambition to be esteemed and reckoned with by one's fellows. Whatever gives one advantage in competition with others, or in influencing and leading others, or makes him looked up to, admired, or considered by others, appeals to this interest and will be desired when the social advantage to be gained by means of it is made clear.

For example, a new fashion is taken up as a means of securing social recognition, or prestige. What makes one appear well dressed is desired as a means of securing recognition from his business associates. See the discussion of "Fashion" in the "Psychology for Business Efficiency". Posting the names and records of the men who do the most ef-

fective work in a factory may stimulate others to do much better work in order to secure such recognition. This appeals to the instincts of emulation, rivalry, and self-assertion, which are elements of this interest.

HEALTH INTEREST

The health interest attaches itself to anything which prevents or cures disease, or prevents accident. It is concerned with wholesome food, water, light, ventilation, dwelling place, conditions of labor, physical culture, and athletics.

EDUCATION INTEREST

The educational interest is concerned with whatever increases knowledge, or wisdom, or makes for efficiency in economic, social, or political activities, or enlightens one as to a better means of self-realization along the line of any recognized interest. It makes for culture as its ideal. Culture is knowledge, appreciation, and utilization of the things which give enduring satisfaction.

ÆSTHETIC INTEREST

This is generally known as the interest in beauty. It is concerned with such things as the theater, literature, music, painting, sculpture, architecture, landscape gardening, beautifying the person, the home, and its furnishings, and surroundings, and with the beauty of natural objects, etc.

WEALTH INTEREST

The wealth interest aims at mastery of the material environment. Whatever increases ability to earn money, or save money, or reduces expenses, appeals to this interest.

It is a superficial and false ideal which makes the pursuit of wealth the supreme end in life. The attainment of wealth is not a true criterion of success. The amount of wealth attained is only one among several elements which must be taken into consideration in estimating business success. Riches acquired without adequate beneficial service rendered to others, in return for the wealth secured, is exploitation. It departs from the principle of the square deal, and is bad business.

The attainment of business success is only one element involved in attaining broad human success. The attainment of wealth is desirable mainly as a means of securing satisfaction along other lines of self-realization.

Two motives contribute largely to the effective performance of the economic activities of business. One motive is to meet the demands for service to the well-being of others, which the business aims to satisfy. This is the vocational interest. The other motive is to provide the means of satisfying not only the economic interests of the worker, but also his æsthetic, educational, sociability, health and recreation interests as well. The economic, or wealth,

interest is only one of several belonging to the same general class. These interests are manifested in many sub-varieties and combinations. The moral interest aims to so co-ordinate their various activities that all will receive a degree of satisfaction such as will make them contribute duly and harmoniously to collective well-being.

VOCATION INTEREST

In one aspect, the vocation interest is an interest in rendering to others service which will promote their well-being. The vocation interest aims also to make the rendering of service to others, a means of securing the things which will promote one's own well-being. The two motives working together aim at a mutually advantageous exchange of services, or of means of securing service.

Every one may rightly demand the satisfaction of his own interest in well-being, provided he renders an equivalent service in promoting the well-being of others.

Most people are under the necessity of making a living, in order that they may be able to meet their obligations to enrich the well-being of themselves and others. Vocational activities are directed along certain specific lines largely as a result of the fact that efforts to satisfy the needs must be correlated and concentrated along rather narrow lines, in order that they may become efficient and deserve and receive reward.

Work which is taken up merely because it affords an opportunity to make a living may lack qualities which are very essential to the satisfaction of the vocational interest. In order to gain due satisfaction for the vocational interest, one should specialize his efforts along some line in which he feels he is rendering value received to others in return for the compensation he receives for his work. Vocation should be chosen along lines of fitness to serve, not merely along the lines in which it is possible that the greatest financial returns may be secured for serving. The feeling that the activities are worth while helps make them interesting. The satisfaction which comes from doing worth-while things is one of the greatest rewards that service can gain.

Vocation means a calling to render service to others along the line for which one's abilities best fit him. The choice of a vocation is the selection and devotion of one's self to activities one feels called upon to perform. To be truly vocational, the activities should be interesting. The achievement of their end should bring satisfaction. An occupation which meets the demands of one's nature, and in which one's aptitudes and abilities fit him to be successful in rendering service to others, is the greatest source of lasting happiness.

Work which really meets the demands of the vocational interest may at first be neutral in feeling or even distasteful. Yet if the occupation, as a whole, is really felt to be worth while, much of the

work will take on an acquired interest. It is more than likely that work, which as a whole satisfies the requirements of the vocational interest, will always be found to involve distasteful, or painful activities.

When one has chosen his vocation, he should say to himself: "This is my job. It is up to me to do it, or to be done for. I will do it."

Practical necessity usually compels one to confine his vocational activities to a rather narrow line. His vocation can not afford satisfaction along all the lines of his interests. It must be regarded as the means of securing that which can be used to secure satisfaction along avocational lines.

One's vocational activities do not completely fulfill his obligations to render service to others. Part of one's serious efforts at self-realization must be devoted to rendering service to others, for which the only compensation is the satisfaction resulting from the consciousness of the service rendered. One must render a vocational service to others, as individuals, and as members of family, political, civic, and other social groups.

To successfully perform serious work of the more important sort, intense voluntary concentration must be maintained for a considerable period of time. Such work involves dealing with theoretical or practical problems which must be solved in order to promote well-being. The problem may be concerned with adapting or employing external means to satisfy a felt need. Or, the problem may be of the in-

tellectual sort which aims at satisfying the felt need for orderliness and consistency in our knowledge.

Being thwarted in the solution of a problem gives displeasure and adds to the fatigue of the work. A satisfactory solution of a problem, or the consciousness of progress toward a solution, gives pleasure. Such pleasure plays a wholesome part in the economy of life.

Even when work is rich in the amount of such pleasure it gives, it finally becomes fatiguing and demands periods for recuperation and recreation. The fatigue and the need for means of recuperation are much greater in lines of work which are largely routine and disagreeable in character.

WORK AND THE NEED FOR RECREATION

Work that is full of interest and pleasure finally becomes fatiguing and demands periods for recreation. Life grows wearisome as it follows the daily grind of routine in shop, or store, or home, even if the occupation, on the whole, is congenial. Such work may grow repulsive, if persisted in too long without interruption.

The dull rounds of some forms of monotonous toil become deadening in their humdrum influence. One may become so desperate as to be ready to resort even to crime to break the monotony, if no other means is available. Even if sufficient leisure is provided for rest and sleep, they alone are not sufficient to restore the exhausted energies of one employed

in the more deadening occupations. Such a person can not come back to work with a wholesome feeling, unless some form of recreation is provided.

One employed regularly at a congenial occupation will have many interests not sufficiently exercised in his ordinary work. He will become conscious of the need of satisfying these interests.

The brain cells corresponding to various developed interests should be stimulated, to use up the accumulated energy. In this way alone can the capacity for supplying energy be kept in efficient working. Atrophy, or wasting away of capacity, follows disuse.

A disagreeable emotional tone arises from developed interests which are denied wholesome stimulation and satisfaction. A similar feeling results from interests so stimulated that an undue amount of energy is used up. Such an unpleasant emotion spreads a disagreeable feeling over vocational or avocational activities, which would otherwise have an agreeable tone. When work is monotonous or disagreable, the unpleasant feeling, arising from the understimulated or overstimulated interests, may add to the dislike for it to such an extent as to make it practically unbearable.

RECREATION INTEREST

The recreation interest plays a very important part in the activities of a well ordered life. This interest demands that vocational and avocational work

must not be allowed to fill all one's time. One must have time to engage in the satisfaction of other interests. One must also have opportunity, and proper stimulus and incentive, to insure the exercise of otherwise neglected interests.

Recreation may be satisfactory in character, though it does not fully exercise all one's interests outside his regular line of work. Practical considerations generally make it necessary for one to seek his recreation along rather narrow lines of interest. The instinctive impulses leading to recreational activities thus become systematized by habit along special lines, such as the theatre, music, art, literature, travel, games, sports, dancing, social functions, study, forms of manual work, etc.

Recreational activities should appeal to existing interests not sufficiently stimulated in ordinary work. They should have the character of novelty and contrast, when compared with regular vocational and avocational work. They should arouse adequate but not excessive activity. They should give rise to a pleasurable feeling which tends to persist as a permanent emotional tone. Recreation should also provide for bodily exercise of a sort and kind necessary to keep the various organs of the body in good working condition.

The agreeable emotional tone aroused by activities which meet these requirements will displace the disagreeable feelings resulting from the deadening routine of work, or from fatigue, or lack of proper ex-

ercise and satisfaction of developed interests. This pleasurable feeling pervades the conscious processes involved in ordinary work, and adds to the efficiency of the efforts.

Proper recreational activities facilitate the gaining of energy during the periods of rest, and create conditions favorable to the performance of the various physiological activities which make one efficient. To be classed properly as recreational, activities must re-create, or create again, one's powers of body and mind.

Exercising interests involved in regular work, along different but more pleasurable lines, may be recreative in character, if the demands on the interests have not already been too great. The professional baseball player may find recreation in playing golf. One whose work is routine and not too fatiguing may seek recreation in matters involving close concentration of the attention and sustained mental effort, and vice versa.

The instinctive demand for recreation is one of nature's provisions for keeping alive and developing, through exercise, capacities which would otherwise die. It is also a provision for renewing the waning powers of mind and body, and keeping one's working efficiency up to the standard.

The gregarious instinct is a strong impelling force in choosing the forms of recreation. It leads one to seek his recreation in the company of others. The sympathetic instinct also leads one to seek to share

the emotions of others and to share his emotions with them.

The play instinct plays an important part in the development and form of recreational activities. It, and many other subjects, taken up briefly, in this book, are discussed more fully in the author's "Psychology for Business Efficiency."

The recreation interest may be concerned with satisfying any one, or several, of the other interests previously mentioned. The end to be gained in doing a thing as a means of satisfying the recreation interest is different from the end sought in exercising the interest as part of the regular work of life. Yet one who understands the true nature and function of recreation, can often find, or make, much of his daily work recreative in character.

Almost any line of activity may be undertaken as a means of securing recreation. Many things are sold almost solely for recreational purposes.

One who is selling an automobile, for example, as a means of recreation will have to talk along quite a different line from one who is selling an auto truck as a means of satisfying the wealth interest. The recreational interest aims at novelty, contrast through change of scene or form of activity, restoration of mental and physical energy used up by serious work, and the displacement of a disagreeable or neutral, or less pleasurable state of feeling by a pleasurable emotional state; all of which tends to bring about a well-founded assurance of mental and

physical fitness. The seller of an automobile may also, of course, appeal effectively to the sociability and other interests.

The things with which the recreation interest are concerned are innumerable. They include the theater, music, literature, lines of study, art, games, travel, hunting, fishing, social activities, constructiveness applied in various manual occupations, agriculture, athletic sports, swimming, boating, etc.

CORRELATION AND CO-ORDINATION OF INTERESTS

Every one has philanthropy, politico-legal, sociability, health, education, wealth, beauty, vocation, recreation and family and home interests. He also has a moral interest which impels him to strive for self-realization along the lines of all these interests. He is under obligation to have due regard for the other interests while seeking satisfaction for any particular interest.

As a matter of fact, as a result of deficiency in natural endowment or of imperfect educational development, one may not strive for the satisfaction of his various interests in such a way that each will contribute its part, harmoniously with the others, to the promotion of his general well-being.

One may not have shown due regard for his interests in choosing and pursuing his vocation. He may be held by deeply ingrained habit to seek excessive satisfaction for certain interests. In such a case, certain interests will have been neglected so that they have not developed properly, or so that they have died out from lack of exercise.

Health may be knowingly disregarded in the struggle for wealth or pleasure. Or one may struggle according to his light, but he may not have been fully awakened (or may have gone to sleep) to the

importance of the realization of his interest in certain lines. One may be alive to the importance of physical well-being, yet he may not clearly realize the importance of a certain factor as a means of impairing or improving physical efficiency.

Success in attaining satisfaction for one's vocational interest in a business, professional, scientific, artistic, political, or other career can be secured only through a long-continued concentrated process of thinking and striving.

The aim in the background of consciousness holds one continuously to a definite line of effort. The satisfaction resulting from the partial successes achieved, and the foretaste of a fuller satisfaction to be obtained from the still greater successes one believes he can achieve, spur one on to greater and more concentrated effort. One sets his eye on the end to be reached and struggles on, stimulated rather than daunted by obstacles, unrelentingly toward his goal.

The business one builds up in this way becomes flesh of one's flesh and blood of his blood. It grows to be another part of himself. Such an one is always in danger of becoming intolerant of interest in everything that does not pertain to his business. He is hypnotized by concentrating his attention on the fascinating lure of a great vocational success.

One is justified in making his vocation a major interest in life. But he is ever in danger that his vision will be so short in range and narrow in scope

that he will wake up some day to the fact that he has been merely making the means for securing a living. He may come to realize, when it is too late, that he has lost for all time the greater opportunity of making a life rich in the nobler, more significant, more abiding elements of joyous satisfaction.

He has become hardened, narrowed, and unsympathetic. He has failed to gain the satisfaction to be derived from disinterestedly serving the well-being of others, from the unselfish friendship, from broad interest in learning, in literature, art, health, and life-giving recreation.

The supreme interest in life is the interest in symmetrical, harmonious, many-sided development, known as self-realization. One should be ever on his guard against exalting into a position of supreme, if not sole importance, one of the interests which should really be subsidiary to the interest in being a fully developed person. In the strenuous drive for great achievement, interests of vital importance are likely to become stunted or atrophied because they have no chance to develop through exercise. Eternal vigilance and effort, alone, will enable one to avoid sacrificing the richer, nobler self on the altar of a narrow success.

While many fail in this way, many more fail because they weakly follow the course of least resistance. They take a spineless, purposeless attitude toward life. They need to feel the spur of great ambition.

This discussion must have made it clear that there is a very complex correlation between the interests as they habitually manifest themselves as desire in the ordinary individual.

INTEREST, DESIRE, VALUE, AND PRICE

Interests are habits of attending, thinking, feeling, desire, or aversion and striving away from or striving toward certain classes of objects.

A desire is both a painful sense of **something** lacking and a pleasurable foretaste of the satisfaction to be derived from securing the thing which will supply the lack. The foretaste of satisfaction is usually the more prominent or focal element in the desire. In this case the painful element will be found occupying a more or less prominent place in the margin. However, the painful element may be in the focus and the pleasure to be gained in the margin of consciousness. Each heightens the other by way of contrast. Both together give strength to the desire.

The desires have normal strength, and the values attributed to the things are normal values, when they are proportional to the various services the desired things will render in promoting well-being, or harmonious self-realization, in which all the lines of interest are satisfied in due proportion. Desires are normal when they are proportional to the intrinsic value of things. By intrinsic value we mean value in promoting general well-being. Desires and valuations are subnormal if they fall short when measured by this standard. They are inflated to the

extent that they are in excess when measured by that standard. Inflated value and desire, and subnormal value and desire, are abnormal. Desire and valuation are perverted when the desire is attached to, and value is attributed to, a thing which does not contribute to well-being. Intrinsic value results from the possession of qualities which fit a thing to serve as a means of contributing to normal satisfaction of interests. By normal satisfaction is meant satisfaction, the value of which is appraised by applying the norm of self-realization.

Commercial valuation, or determining the price one can afford to pay for a thing, is arrived at by determining the balance of gain or loss in well-being which will result from the expenditure, or amount of the service, or its equivalent means of securing satisfaction, which is required to be given in exchange for the service in promoting well-being which will be gained by securing the desired thing.

The intrinsic value of a thing can not be made the basis for determining the price which may rightly or fairly be asked for it. A man of great wealth might conceivably be placed in circumstances such that a drink of water, or a supply of fresh air, or something to eat, would be of more value to him than all his wealth. In such a case, one who supplied the water, air, or food would not be justified in requiring all the man's wealth in exchange for it, if supplying it involved very slight sacrifice on his part. One who supplies a need is entitled to payment, not

in proportion to the extent of the need, but in proportion to the services which must be rendered in order that the need may be supplied.

The price asked should not be in proportion to the value of the serviceable thing offered for sale. It should rather be estimated on a basis of securing a fair return for all that is contributed by the services rendered in making the serviceable thing available. Such contributions may be made in preparing the raw material and in the industrial processes of manufacturing it, in furnishing capital to carry on the industry, and ability to organize and manage it; or in transporting or selling the raw material or finished product. All who render service in any of these lines are entitled to a fair compensation. Price should be based on the cost of producing and marketing, and should allow a fair margin of profit to all rendering services in these lines. All parties to the exchange should profit by the transaction. Price not based fairly on the service rendered in producing and marketing has been inflated through control, or reduced through competition.

It is extortion, exploitation, or perversion, and is essentially fraudulent if, through monopolistic combination, or other acts in restraint of trade, or through misrepresentation, or overpersuasion in selling, one exacts an unearned increment of profit. Any unnecessary inflation of prices, or any disproportionate stimulation of interest, or any perversion

of interest, is bad business, and hence is bad salesmanship.

Governments grant to inventors a monopoly lasting for a few years, in order to reward them for the benefits they have conferred on society in making the invention and to stimulate the production of inventions.

Continual success in business depends primarily on maintaining the good will created, through lowering the cost of production and price and increasing the serviceability as much as the highest efficiency and fair returns for services rendered will permit.

The salesman should set forth clearly the normal value of the thing. It is his duty also to see that the price secured is not based on the serviceability of the thing, but that it is fairly proportionate to services rendered in making the serviceable thing available. A sale is dishonestly made when the price received is knowingly greater than the normal serviceability of the thing sold. When salesmanship secures a price in excess of normal serviceability, it is guilty of exploitation. When salesmanship secures a price which does not properly pay for services rendered in producing and marketing, it is guilty of inefficiency.

TRUTH, THE IDEAL OF SELLING

Truth, as the ideal of the Associated Advertising Clubs of the World, requires on the one hand a truthful and adequate setting forth of serviceability in promoting well-being. On the other hand, conformity to the ideal of truth demands that the price asked must be fairly proportioned to the services contributed in producing and marketing. This is the ideal to which all salesmanship should strive to realize.

"Caveat emptor," let the buyer take care, can no longer control in modern marketing. Good will is based fundamentally on honest and efficient service. The continued prosperity of a business depends on good will.

Producers and consumers, as a whole, are mutually dependent on each other. Good business has regard to the well-being of both parties to every business transaction. Benefits and the rendering of services must be mutually advantageous, in order that capacity to produce and capacity to consume may develop equally.

Truthfulness in salesmanship consists in setting forth adequately the article's serviceability to the person to whom it is sold. The truthful salesman will not understate, or overstate, or exaggerate this serviceability. He will not exact or take from the

customer more than a fair price for the service the article will render to him. Such truthfulness is demanded of salesmen in accordance with the moral principles which apply to all walks of life.

Truthfulness in selling is not an obligation arbitrarily imposed on a salesman. It is the only foundation on which permanent business success can be built. Efficient salesmanship must render a service which creates confidence and begets good will. It is not sufficient that the salesman honestly believes that the sale he makes will prove satisfactory. He must have such knowledge of the serviceable qualities of the thing he sells, of the general demands of business, and of the requirements of the buyer that he will be able to make satisfactory sales.

The salesman who renders the best service as a business-builder will carefully avoid making sales that do not render profitable service to the interests of the buyer. He must know the truth about the value-giving qualities of his article. Without exaggeration or distortion he must present this truth to the buyer.

The salesman, to a certain extent, relies on the confidence and good will of the buyer, on suggestion, on personality, on tactful approach, on pleasing delivery of the selling argument, on wording the selling talk in such a way that it will have great effectiveness in arousing emotional activity and volitional impulses which tend to close the sale. It is proper that the salesman avail himself of all the effective

aids to selling. Such means are employed legitimately only so far as the salesman sees to it that, in making the sale, he is profitably serving the interests of the buyer.

The salesman may properly resort to an appeal to various emotions and to suggestion to action to get the buyer to accept the estimate the salesman puts on the service the value-giving qualities will render, provided the salesman's estimate is fairly proportional to the satisfaction the buyer will derive from the purchase. It is also true that the purchase must not involve undue sacrifice of other interests.

It is the salesman's duty to get a fair return for the service rendered. Getting more in return than the service rendered is worth, is not salesmanship. The seller is working a confidence game. He is obtaining money under false pretenses.

The article will render full service to the consumer, only as he has clearly in mind the service the value-giving qualities of the article fit it to render. Even if the sale is made largely by emotional appeal or by suggestion, the salesman should see that the buyer is correctly informed about the article. The salesman should make it a point to show the buyer how to get the serviceability out of the article, even if the sale can be made with less effort than that requires.

In selling to a reseller, the salesman can often make clear the best methods of merchandizing, of financing, and of creating good will. He is entitled

to adequate return for such service. However, the return should come in the increased profits which come from the increased market for the goods.

AWAKENING LATENT NEEDS

A market is a class of people whose needs and interests make them possible consumers, and who have sufficient means to enable them to purchase when the latent desire has been sufficiently stimulated. The market may be increased by stimulating desire; or by lowering the price so that a larger number will be able to spend the amount required to secure the satisfaction for their desires.

Men are not intuitively aware of their real needs. The existence of the need must be made clear by educational means. It is necessary to undertake consciously and systematically to develop latent capacity into an active tendency to desire.

The salesman and the advertiser perform an important educational function in creating desire. The awakened desire to satisfy the need one is thus made aware of, stimulates him to develop greater efficiency in serving the needs of others in order to get the means of satisfying his own desires. The desires thus awakened by the salesman and advertiser stimulate the men in whom they are awakened to more efficient service and thus increase production in other lines.

AROUSING DESIRE

Success in selling depends on finding what interests of the consumer are concerned with the goods so that appeal may be directed to them in such a way as to arouse desire. It will depend also on wisdom in selecting the qualities of the article which give it value as a means of satisfying desire; and on skill in presenting these value-giving qualities in such a way as to create desire for the article and arouse an impulse to buy it. The tendency to buy may be strengthened indirectly by anything which strengthens the desire. It may be strengthened directly by suggestion, or command, which stimulates the impulse more strongly.

No strong desire to possess a thing can be aroused unless an appeal is made to some form in which one of the instinctive or developed interests is manifested. When an interest exists vividly in the psychological sense, that is when one is keenly conscious of the need, all that is required to arouse desire is to show that the thing is a serviceable and available means of satisfying the need.

When the interest exists merely in the broader sense in which the fact of the need is not recognized, the salesman's task is to make clear the extent to which the well-being is concerned with the thing offered for sale.

The salesman must determine whether it will be advantageous to awaken the impulse of striving away from the unsatisfactory condition of affairs, as well as the impulse of striving to gain the satisfaction to be secured by making the purchase.

When the demand already exists but the sense of something lacking is a familiar and tolerated sore, it may be necessary to dig into the tender spot and irritate it afresh, to give it potency in impelling to action. People become dulled and apathetic to old needs which they have had little hope of being able to satisfy. To arouse such a person to action one must not merely kindle the hope anew. He must reawaken keen antipathy to the evil which has come to be regarded as necessary and to be ignored. He must also awaken a foretaste of the satisfaction to be gained by securing the article. He will then have created a desire in which the impulses are both pushing and pulling one on to buy the thing.

A desire is an impulse to action as well as a feeling. The impulse is carried out into action when one sees his way clear to securing the means of satisfying the interest from which the feeling and impulse arise.

The means of satisfying a need is a want. Desire and want, and demand and supply, are similar pairs of similarly related terms.

The reader who wishes to gain more insight into the bearing on salesmanship, of processes and factors of thinking, feeling, and acting will find addi-

tional matter in the author's "Psychology for Business Efficiency." See especially the topics, "Fashion," "Leadership," "Creating Good Will in Business," etc.

The things with which the various instincts and interests are concerned will be discussed more fully in the "Psychology of Advertising." So will the various instincts and interests which may be appealed to most effectively in selling various things. See also the adapting of the selling appeal to the existing form of the interest.

SUGGESTION AND IMITATION

In the broadest meaning of the term, suggestion is the process by which a person is caused to experience an emotional state, to accept a proposition as true, or to perform an act, without giving adequately deliberate consideration to the grounds, or reasons, or evidence for or against the suggested act, feeling, or opinion thus accepted. Such a suggestion may come from the words, or expression, or acts of another person, or persons, or from material things.

Suggestion in the above sense may be known as hetero-suggestion to distinguish it from auto-suggestion. Auto-suggestion is the process by which one influences the physiological processes of his own body, or his own feelings, ideas, or volitions. Some of the applications of auto-suggestion will be made clear in the chapter entitled "Developing Character and Personality." Auto-suggestion and hetero-suggestion are both discussed more fully in the author's "Psychology for Business Efficiency."

The suggestion we are here concerned with is hetero-suggestion. The prefix "hetero" will be omitted in accordance with the general usage.

The acceptance of a suggestion is technically known as imitation. Suggestion and imitation are two aspects of the same process.

In studying suggestion, attention is directed to the characteristics or qualities which fit the stimuli to bring about the result. One also studies the processes in accordance with which the stimuli work in bringing about the result.

In studying imitation one analyzes the processes taking place in the mind of the one influenced by the suggestion. He considers the qualities or traits of character that determine the sort of imitative activity which results from the suggestion.

In order to use suggestion effectively in practical salesmanship one must understand the instincts, interests, habits and other mental processes of the customer, and must select appropriate suggestions and employ them in such a way that they will bring about the desired results.

The following discussion considers the problem of putting to practical use the suggestive-imitative process, in which the salesman employing his selling talk, solicitation, or appeal as a suggestive force, endeavors to secure the imitative response which takes the form of making the purchase.

It must be borne in mind that the term imitation is used here in the technical sense explained above. In this sense, imitative acts include all acts that are performed without giving, before their performance, adequately deliberate consideration to the reasons for or against the performance. Imitation includes all acts performed as the result of an appeal, excepting such as result from fully reasoned

choice or demonstrated truth. One might be said to be "suggestioned" into doing such acts, if our language permitted such a term. In the absence of a more appropriate term, the word "imitative" must be used in a technical sense to describe such acts.

The imitation which follows suggestion is usually not an exact copy, or replica, of the mental state or action imitated. Generally the response to the suggestion is modified or determined to some extent by the native or acquired predispositions of the one "suggestioned." Some element of self-expression usually appears in the imitation.

Imitation and suggestion have been treated more fully in "Psychology for Business Efficiency." See also the subjects "Fashion" and "Fads" in that work.

FACTORS OF SUGGESTIBILITY

When the idea of doing a thing to which one is predisposed by instinct, or interest, or habit, gets into mind so that the attention is centered upon it the actual doing of the thing tends to follow as a matter of course, unless the act is prevented, or as it is technically described, is inhibited by another idea obtruding itself on the attention.

If one is offered something to eat between meals when he is hungry, he experiences an impulse to accept it. However, if it occurs to him that eating the proffered food will spoil a good dinner coming later, or will cause indigestion, the idea of the undesirable

consequences of the act will hold in check, or inhibit, the strong impulse to eat.

The awareness of a situation which concerns the satisfaction of our instincts, or interests favorably or unfavorably, tends to bring about behaviour adapted to deal satisfactorily with the situation. Capabilities acquired innately and developed by experience come into play. The situation is handled as native and acquired aptitude have fitted us to deal with it. Responses have become largely habitual.

The feelings and emotions manifested in the behaviour of others arouse similar emotional states in those who observe this behaviour. Fear and joy and sorrow are thus aroused by suggestion. In this way the confidence, enthusiasm, and good will animating a salesman are manifested in his behaviour, and tend to arouse like states of mind in the man whom he is soliciting.

One who closely watches the acts another is performing will tend to perform similar acts. One person on the street looking up will cause many others to look up. The idea of the act tends to pass over into the performance of the act.

We are all influenced by the volitional aims manifested by those around us. The direct command and the obedience to the command is an illustration. So also the suggestion to any line of action as desired and the compliance with the suggestion. In such suggestion and compliance the instinct of self-assertion is manifested in the one

who makes the suggestion, while the instinct of self-subjection is manifested in the acceptance of or submission to the suggestion.

If the one making the suggestion is looked upon as having prestige or authority, that fact tends to bring about compliance with the suggestion. The impulse of self-subjection is aroused. A state of increased suggestibility is induced. This state is aroused by those who make an impression of having power, wealth, great physical strength, large size, social standing, expertness, etc. A similar effect is produced by a reputation for intellectual superiority, or for great skill in any line, or even by the mere fact that fine clothes are worn.

Anything giving the impression that the one making the suggestion desires to promote the well-being of the one to whom it is made, tends to secure compliance with the suggestion. Anything which gives the impression that the maker of the suggestion aims to further his own selfish ends, leads the recipient of the suggestion to resent it and to refuse to carry it out. In this case the suggestion arouses the instinct of self-assertion.

Qualities which tend to promote well-being are called positive. Qualities which hinder well-being are called negative. The manifestation of positive qualities of character gives effectiveness to the appeal, and vice versa.

Certain things were mentioned above as factors which arouse the instinct of self-subjection and in-

crease suggestibility. When the opposites of these factors are manifested, they arouse the instinct of self-assertion and decrease suggestibility.

Any state which prevents opposing ideas from being aroused through association tends to increase suggestibility. It is greatly heightened in hypnosis. Fatigue, sleepiness, and ill health would thus tend to increase suggestibility along certain lines. However, they bring on a state of general inertia which makes it difficult to influence one along most lines. The consciousness that one is not in a fit condition to deal satisfactorily with the situation may arouse an impulse to contra-imitation, or to act in a way contrary to the one desired.

Deficiency in knowledge, and lack of organization of knowledge in regard to matters involved in responding to the appeal, are factors which prevent the reproduction of inhibiting ideas through association. Hence, deficiency of knowledge, or lack of organization of knowledge, will make one more likely to be influenced by the suggestion. Stock in doubtful mining ventures is sold, not to experts in mining, but to those who know nothing about the business.

For a similar reason one is inclined to act on an appeal along the line of a strong desire. One who is sick can be easily induced to buy patent medicines. Members of one party are inclined to accept, without much evidence to support it, a story reflecting on the opposition party.

In the appeal of the salesman, several varieties of

suggestion may be co-operating to bring about the response of the man whom he is soliciting. A discussion of some of the more important will follow.

SUBCONSCIOUS IMITATION

The customer may be influenced to action by unconscious or unintentional imitation through contagion by direct suggestion. Such subconscious or unintentional imitation is brought about mainly by the effect of the suggestion on the dimly conscious marginal processes known as the subconsciousness. The suggestion produces its imitative response through the impression it makes on marginal consciousness, while the focal consciousness, which is a large factor in controlling action, is occupied with other things. This form of suggestion arouses impulses and activities which seem to be self-originated. In determining the response to the appeal they co-operate with the desires and purposes springing from the conscious deliberative processes.

Through subconscious imitation one may absorb the ideas and feelings and copy the acts of others when he has no intention or purpose of doing so, or even contrary to his express purpose to refrain from doing so. A northerner living in the south may thus unconsciously catch the southern drawl, or the southern attitude toward the negroes. We may cough, sneeze, or laugh, or yawn merely because someone else does so in our presence, or suggests it by something he says.

When those around us are depressed, discon-

tented, irritable, or pessimistic we tend to have a like feeling. When we are mingling with happy or optimistic people, the world looks brighter to us. This sort of suggestion is often conveyed by very subtle or intangible means, such as the general tone of speaking, the bearing, the expression of the features, etc.

Through this form of imitation, the emotional state of the salesman tends to inspire a like state in the mind of those with whom he is dealing. Hence, the salesman should cultivate the habit of looking on the bright side of things. He should fill his mind with optimistic thoughts. One who appears happy and confident will tend to arouse a similar state of mind in those with whom he is dealing. He will thus favorably dispose them to the acceptance of his proposition.

In many instances the customer will respond more readily to the suggestive influences of the feelings and impulses manifested by the salesman, than he will to the reasoning of the solicitation. Feelings and impulses are directly contagious by sympathetic induction. Through subconscious induction feelings and impulses lead to subconscious imitation. The customer comes to feel a strong impulse to respond favorably to the solicitation. The impulse has been suggested so subtly that he feels it to be self-originated. Closing seems to be an act of spontaneity rather than one of self-subjection to the solicitation of the salesman.

This gives a clew to the type of man who will make the most successful salesman. The salesman who is animated by strong feelings and impulses will be much more successful than the coldly logical man, other qualifications being equal. The mere energy or industry of such a man will not make up entirely for the lack of "pep" or fire of the other sort. Of course, the feelings and impulses must be of the right sort. The salesman should be animated with the spirit of service to the well-being of the customer, rather than with a selfish desire to secure a profit from the sale, regardless of the interests of the customer, or with fear lest the customer may escape without buying.

This sort of suggestion is made partly through the tone of voice, which of course appeals to the ear. The choice and arrangement of words, the attitude or bearing, the gestures, the expression of the face, and the general appearance and behaviour of the salesman have strong suggestive force. Most of the last-mentioned factors, of course, appeal to the eye.

The salesman should take a position so that these sugestive factors can be clearly seen by the man whom he is soliciting. The salesman who retires into the shadow overlooks the fact that a great part of the suggestive force, exerted unconsciously during the solicitation, must make its appeal through the eye of the prospect.

The more clearly the man solicited can see the

salesman, the more he will be influenced by the visible manifestations of magnetic, strong, authoritative, efficient personality. Through such visible influences the salesman can inspire belief in his honesty, good will, and desire to serve. He can thus transmit to his customer his enthusiasm and the confidence he feels in his line. These subconscious suggestions accompanying the selling talk may be regarded as a by-product of the solicitation, but they are very important factors in getting the desired result.

The man who is being solicited should be able to see clearly the suggestions made by the salesman, which appeal only to the eye. However, his attention should not be centered on them, but on the selling talk, and on the sample, or the article, or the demonstration of what is being sold.

The man to whom the selling appeal is being made will unconsciously, in his bearing and expression, make suggestions which reveal the sort of an impression the solicitation is making on him. Hence, he should be seated in plain view of the salesman.

CONSCIOUS OR INTENTIONAL BUT UNREASONED IMITATION

This form of imitation is not necessarily unreasonable. As a matter of fact, the acts to which it leads are generally quite reasonable. They do not spring from a process of reasoning, but they can generally be justified by a process of reasoning. The acts thus performed come under the head of ideo-motor activity. Some instinct, or interest, or desire, is aroused by suggestion. The impulse to action accompanying it, is in the focus of consciousness, and tends to pass over into the appropriate act. The suggestion is made without a supporting reason. If it secures and holds the attention, so that inhibiting ideas are prevented from occurring, it will be carried out into action.

Sometimes a suggestion of this class takes the form of a direct command. It may be made by anything which arouses directly an impulse to action. It is then an appeal. The suggestions a salesman makes in his efforts to close the sale are often of this type.

In many of the simpler forms of salesmanship the salesman relies upon a direct suggestion for which he gives no supporting reason. The huckster cries Apples! Apples! The newsboy yells the name of his paper. Each in this case relies on an associative

process to arouse an impulse to buy in the mind of the hearer. If a huckster calls out an attractive quality of his wares, he attempts to arouse the impulse to buy through a direct suggestion which creates desire.

The newsboy attempts to arouse desire and impulse to buy when he calls "All about the suicide!" He uses a suggestion aimed directly at the impulse to buy, rather than one intended to arouse desire, when he says, "Buy a Daily News." This direct command tends to arouse the instinct of self-subjection to the will of another. This merely means an impulse to comply with the expressed volition of another. Sometimes the newsboy uses still another direct suggestion as a closing feature, when he tries to put the paper in the hands of a passerby.

Things to eat, drink, or wear can often be sold without employing an appeal which arouses complicated processes of reasoning in the mind of the buyer. The salesman's task is merely to impress the attractive qualities on the mind of the customer by display and description. The clear perception of the attractive features is sufficient to arouse the impulse to buy.

The salesman often employs this type of suggestion without realizing the effect he is producing. The clerk frequently spoils an opportunity to make additional sales by asking "Is this all?" It wouldn't be much worse to ask "This is all today, isn't it?"

The clerk who asks "Is there anything else you would like to look at?" doesn't do much better.

As he closes one sale, a salesman can often lead to another by making a definite suggestion of some appropriate and particularly attractive article. For example, a clerk who has just sold a shirt could say "We have just gotten in a very attractive lot of ties. How do you like this one?" as he tactfully places before the customer a becoming tie. He thus secures an opportunity to demonstrate the attractiveness of the tie and to tell about its excellent quality and stylishness. In doing so, he will be making rational suggestions, which will be considered later.

Suggestions of this sort that are potent and far-reaching in their consequences can be made in subtle ways of which one is not fully conscious at the time. How would it affect the amount of business done on credit if the salesman regularly asked "Will you have this charged?" Consider the effect on the delivery charges of a clerk taking one of the following courses: First, suppose he asks "Will you have this sent out?" The average customer would consider the question an invitation to have the thing sent out and would answer, "Yes," though, of course, some would say "It will give me no bother. I may as well take it." Again, suppose the clerk says "Will you take this with you?" Many would say yes, and would take it, though some would ask to have it delivered. The question in the latter form might do much to reduce delivery charges, though a few might resent it

as implying that the store is unwilling to deliver. If the package is one that can be carried conveniently, the best course would be for the clerk, as he thanks the customer, to hand him the package, as if he would take it as a matter of course.

Very frequently a mere suggestion will be more effective than a fully stated reason. Suppose the salesman is trying to induce a merchant to take the exclusive sale for a line. He may say, "Here is a thing which offers such and such an opportunity in your line. (Of course he would make his claims definite.) Any live dealer like you can make a great thing out of it." Some such suggestion would be more effective than to say right out, "If you don't take this, I will sell it to one of your competitors and he will secure a great advantage over you." The salesman should not make statements that may be regarded as suggesting or implying a threat. Such statements arouse a feeling of hostility.

We have been discussing the selling appeal which consists of a direct sugestion for which no supporting reason is given. It should be apparent by this time that this type of sugestion plays a large part in more complex selling appeals. This type of suggestion merges without a sharp dividing line into the type of suggestion supported by an explicitly given reason, or reasons. There is, in turn, no clearly defined boundary line between this type of appeal and the one which aims at bringing about a fully reasoned choice.

As a rule, a salesman can not make a sale by bringing about an unreflecting response to a suggestion. He generally arouses deliberative processes and encounters objections which must be overcome.

FULLY REASONED CHOICE AND DEMONSTRATED TRUTH

Under this heading comes the selling appeal which seeks to make the sale by a clear and forceful appeal to the intelligence and judgment. The salesman aims to guide the customer through a thorough consideration of the reasons for and against buying. The desire to make the purchase is to spring from adequate investigation and deliberation.

The salesman may undertake to make the sale by demonstrating the truthfulness of his claim in regard to the value of the thing he is selling, by putting the matter to the test of actual experience. By trying it out, one could thus prove that a machine can be used profitably in a certain business.

On the other hand, by considering the reasons for and against it, one may be led to the conclusion that a machine can be used advantageously. Or he may reach the same conclusion by reasoning from the experience of others in lines of business similar to his own.

In some instances the salesman can employ both logical exposition and experimental demonstration to establish the desirability of the thing he is selling. However, he rarely endeavors to conduct the customer through a consideration of all the reasons for and against the purchase. In practice he usu-

ally gives consideration only to such reasons against the purchase as are brought up by the customer.

The salesman should never undertake to make a sale when he believes there are valid objections which would make it unwise for the man to buy. He may refrain from mentioning objections which do not occur to the customer, provided he is fully assured that it will, on the whole, be to the advantage of the customer to make the purchase. In most instances, fully reasoned choice is merely an ideal to which the selling appeal aims to approximate more or less closely. This approximation takes the form of rational suggestion, which we consider next.

RATIONAL SUGGESTION AND RATIONAL IMITATION

One can rarely be absolutely sure of the correctness of even his most carefully formed opinions about the things he buys. Deliberate consideration of all the reasons for and against and demonstrably certain truth are merely ideals to which the selling talk approximates more or less closely. This approximation takes the form of a response to one of the varieties of rational suggestion. As the appeal, from the view point of the salesman, is a process of rational suggestion, so it is a process of rational imitation from the point of view of the man whom the salesman is soliciting.

Sometimes it is more effective to merely suggest the reason which will give rise to the impulse to purchase, than it is to state it explicitly. The impulse to purchase will then seem to be spontaneous or self-originated. Carrying out the impulse will then seem to be a matter of self-assertion rather than a case of subjection of self to the will of another. The following are illustrations of suggestions of this sort. "The oldest house in America." "The largest business in this line." "We make articles for the United States government." A different impulse is aroused by the following: "Makers to the king." "Made in Paris." Figurative language, if

skilfully employed, is very effective in arousing impulses to action. Examples of this are "The key to success," "The highway to prosperity," "The road to happiness."

The use of suggestions which become effective only through the working of the associative processes of the mind will be discussed more fully in "The Psychology of Advertising."

It may be well here to caution the salesman against the use of bombast or over statement. Claiming too much arouses suspicion.

RATIONAL SUGGESTION

As was seen before, in some instances the sale may be brought about by employing mere suggestion. In such a solicitation there is no attempt to arouse deliberative processes and through them to create desire. Suggestion may lead to the acceptance of claims to desirability, with full conviction of their validity, without arousing a complicated and exhaustive deliberative process in the mind of the customer. Suggestions belonging to the first two classes may have an important effect in bringing about the act of closing, and in the solicitation leading up to that act.

The ordinary selling appeal consists of suggestions which become effective without the help of logical processes in the mind of the purchaser, and also of suggestions which rely on the co-operation of logical processes to make them effective. It is also true, in a very large number of cases that the sug-

gestions play a more important part than the logical processes in making the sale. To make suggestions effective, avoid vague abstractions. Make specific statements. Employ definite and concrete ideas. See that they are clearly apprehended.

In one type of rational suggestion, in order to reinforce the impulses aroused by reasons why, a suggestion is made which aims directly to arouse an impulse to perform the act of purchasing and to make it pass over into action. Previously to the making of this suggestion, the salesman has made an effort to predispose, or incline, the mind of the customer to a favorable response to the suggestion. By giving reasons why, or by quoting authorities, he endeavors to create in the mind of the customer an attitude which will make him receive the suggestion favorably. A suggestion is then made to bring about the act of closing, to which the other suggestions predispose one.

If a suggestion is clearly and strongly made and opposing ideas are not present in mind, the impulse aroused by the suggestion will follow its natural tendency to pass over into action. The tendency to bring about compliance is strongest, if the suggestion arouse desire, or if it is directed along the line to which habit or instinct inclines. The response to the suggestion will then be purely impulsive in character and will be performed without ulterior reason or purpose for doing it. It is not founded on, or supported by reason why, or proof, or logical

conviction. This type of suggestion was previously discussed.

The suggested act will be more likely to be performed if it is made to seem reasonable, and if it is in harmony with the controlling purpose dominant in the background of consciousness. In many cases, it is not necessary to get the customer to perform an elaborate process of reasoning to prepare his mind so that the suggestion will seem reasonable to him when it is made. For example, a man was desirous of buying a machine to do a certain work. The salesman mentioned a few places where the machines were being used satisfactorily. The prospective purchaser knew the people using them and believed that they would be satisfied with nothing less than first class results. He closed the deal without going into an elaborate consideration of the comparative merits of the machine. The purchaser simply followed the leadership of those who had prestige in that particular line.

In most cases the salesman must indicate the value giving qualities of the article. He must then explain, in such a way as to suggest belief, the main reasons why these qualities give value to the article.

Men do not often reason exhaustively about a thing. The salesman should not lead the customer to deliberately weigh all the reasons, for and against, which can be found.

The successful salesman holds the attention and so directs it that no competing or inhibiting idea arises with strength enough to prevent the sugges-

tions he makes from controlling action. Men tend to accept statements made confidently and authoritatively. The reasons why, given by the salesman, will be held to be true, unless some contradictory idea occurs to prevent belief. The salesman who arouses and maintains a lively interest in his selling talk will do much to prevent such ideas from occurring. He should keep competing lines, and reasons why not, out of the mind of his customer as far as he can. By giving reasons why, and omitting reasons why not, the salesman can often induce the customer to make up his mind to purchase, without encountering serious objections to so doing.

A suggestion, contrary to the purpose dominant in consciousness at the time the suggestion is made, may be performed, if it centers attention on its self so strongly that the dominant idea lapses from consciousness. A suggestion which arouses strong feeling or emotion may thus center attention on itself.

A suggestion is more effective, if it is bolstered up with a background or fringe of ideas arousing impulses tending to reinforce it. That means that the suggestion which is the focal element will be more effective, if the ideas which have recently been in consciousness, or are still in the margin of consciousness, are of such a character that they arouse impulses to action harmonious with the focal suggestion. How this may be brought about will be explained later.

Men are inclined to act on suggestions in regard to subjects about which they know little, as reasons

why the act should not be performed are not likely to occur. They follow the advice of the expert, without demanding proof, in matters concerning which they are ignorant. The man, who can give the impression that he is an expert, can readily impose on the ignorant. Stock in blue sky mining companies is sold to people who know nothing about mining, not to the experienced miners.

Selling to an expert is a different proposition from selling to an experienced buyer. One requires cogent proof before he is willing to act on a new proposition concerning matters with which he is familiar and to which he has given much thought.

The force of habit makes men shy from a proposition which resuires a readjustment or rearrangement of their familiar notions, beliefs, or habits. More than mere suggestion is required to get a man out of a rut which is leading him the wrong way. Care must be taken to make the amount of such readjustment seem as small as possible. The proposition should be presented, as nearly as may be, as offering a better means of attaining an end already recognized as desired.

A suggestion not to do a thing has little, if any, negative force. Such a suggestion merely keeps the attention fixed on doing the prohibited thing. To prevent the carrying out of an impulse to action, the idea of a course of action contrary to the impulse must be present in the mind. The word "not", in a command, does not arouse an impulse to act in an opposite way. To prevent the carrying out

of an action, it is necessary to suggest an opposing or inhibiting course of action in such a way that the attention is fixed on the idea that arouses the inhibiting impulse. To do this, one should awaken an opposing motive to action.

Some men naturally tend to do the opposite of the thing suggested. They manifest the trait known as negative suggestibility. One can almost get them to do a thing by suggesting that they do not do it. About the only way to handle such men successfully is to handle them so tactfully that they will think that they themselves suggested what you wish them to do.

If a man is ill-tempered, troubled, distressed, worried, or pessimistic, the salesman should get him into a more favorable state of mind, or wait until a more opportune time to press his business. Men are likely to be inclined to buy less freely on a day which is unpleasantly windy, or rainy or snowy, or hot, or cold. Success in selling will be affected adversely by the ill health of the customer, his state of hunger, fatigue, discomfort etc. All of these conditions will tend to affect the efficiency of the salesman, also.

Pleasure renders a man more optimistic, gives him more confidence in his own judgment, and renders him more easily influenced by suggestion and likely to buy more quickly and in larger amount. Hence the salesman should try to create a pleasurable state of mind in his customer. He should not inhibting impulse. To do this one should awaken

resort to obvious flattering or jollying. These are likely to arouse offense.

To create a pleasurable state of mind in the customer, the salesman should depend upon a pleasant manner of approach and upon saying in an agreeable way the things he will enjoy hearing. Be optimistic about the prospects for business. Find some feature of his business establishment or something in his method of merchandising that is deserving of praise. Express your commendation sincerely and heartily. Create a feeling of confidence in your judgment and business sagacity. Make him realize that you are really desirous of doing what will be for his best interests.

In dealing with an experienced business man, it is well to come right to the point, and without waste of time to present a proposition which is boiled down and full of concentrated force.

In dealing with people not used to doing business in a business like way, the salesman may find it well to indulge in a little preliminary talk to permit the prospect to get acquainted with him and cause him to feel confidence in him. He may tell a funny story to get the customer to laugh with him. In this preliminary talk he can show interest in the business, or the family, or the outside concerns or hobbies of the customer. He can tell him of long continued business relations with others whom he may know, of recent business done, etc., to show that others have satisfactory business relations with the firm. He can make clear to the customer

that he has a good knowledge of business conditions and prospects, and that he has a mastery of successful ways of merchandising that will help the man in his business, etc.

Adapting the appeal and the solicitation to the various interests as they are found to exist in those who make up the market will be discussed more fully in the "Psychology of Advertising."

INCREASING THE EFFICIENCY OF THE SELLING FORCE

One of the most important duties of the sales manager is to keep enthusiasm alive in his sales-force. One can be enthusiastic over a line, only when he understands its importance. Enthusiasm in a salesman is like steam in an engine. It furnishes motive power. Enthusiasm is contagious through suggestion. It oozes out in all that the enthusiastic man says and does. Its manifestation in subtle ways, in the tone of voice, gesture, expression and bearing of the salesman, arouses a like state in the mind of the customer. In religion, many men are converted more through feeling than through reasoning. Feeling has a like potency in business. A selling talk charged with good will, optimism, confidence, and enthusiasm, will accomplish what cold reasoning alone can never gain. A man's belief that the man he is soliciting will make the purchase, may manifest itself in the subtle ways explained previously and become a potent factor in making the sale.

The salesman occupies an important position in the affairs of the business world. He renders an indispensable service. He has reason for self-respect, if he has prepared himself to perform efficiently the function of his calling. If he can not be

enthusiastic about the line he is selling, he had better quit it and get one he believes in, if he wishes to gain the success his ability fits him to attain.

The salesman should be given a message of good cheer and encouragement when things are not going well with him. Hauling a man over the coals, or threatening to discharge him, does not put him in a state of mind which fits him to do good work.

Credit for success achieved should be given heartily and generously. Recognition, by way of public mention and commendation of specially meritorious achievements, inspires ambition in the one so distinguished. It is also a suggestion that is potent to stimulate others to emulate the worthy act.

The sales manager who renders best service to his salesmen will be most effective in inspiring the salesmen to render efficient service.

CONVENTION OF SALESMEN

Getting the salesmen together for conference and instruction is an excellent means of improving their work. The program may include the demonstration by an expert of the best method of making a sale, of instructional and inspirational addresses etc. It will probably include a round table conference in which the salesmen exchange their views on various problems involved in selling. This develops a spirit of co-operation.

Each man is likely to put forth his best qualities in such a gathering and will take pride in making clear the things which have contributed to his suc-

cess. The results attained by the more successful inspire the others to resolve to rival their achievements.

The suggestions received by each man from many sources jar him out of his ruts. He will set himself to examining critically his own successes and failures, as he hears the successes and failures of others discussed. He will acquire new ideas and will improve his methods of working.

The spirit of competing with other members of the selling force will stimulate the men to put forth greater energy and to initiate new lines of effort. To make the most of what is gained in such a convention, the sales manager must devise ways to keep this spirit alive, while the men are working separately. This can be done by keeping them informed about trade conditions and prospects. They should be told about the success of other salesmen, and how it was gained.

SALES CONTEST

Experience gained in a great variety of lines has demonstrated that a well managed sales contest is a very effective means of increasing business. The potency of the contest is easily explained. It stimulates into activity many of the strongest instincts and interests.

Among the instincts aroused by the contest are the following:—Rivalry, emulation, self-assertion, desire for approbation, fighting, acquisitiveness, cooperation with others, and loyalty to group inter-

ests. Of course some of these are active in the form of the interests developed from them. For example, the contest awakens the wealth, the vocational, the sociability, and the moral interests.

AWAKENING INSTINCTS AND INTERESTS RENDERS MORE ENERGY AVAILABLE

When an instinct or an interest is aroused the activity of certain physiological organs is correspondingly increased. The increased activity of these organs renders a greater amount of energy available for carrying out the impulses which have been aroused.

For example, the suprarenal capsules are small glands above the kidneys which secrete adrenalin and pour it into the blood. When the fighting and emulative impulses are aroused there is an increase in the amount of adrenalin secreted.

The increased amount of adrenalin in the blood stimulates the liver to give over to the blood some of the energy stored up in the liver in the form of sugar. Thus energy is furnished to maintain the increased activity of the various organs of the body involved in carrying out the fighting and emulative impulses. The increased supply of adrenalin also tends to prevent the inhibiting sensation of fatigue from becoming strong enough to check the action before the available supply of energy is used up.

In order that a sales contest may be carried on successfully, means must be employed to stimulate

effectively some, or all, of the instincts or interests previously mentioned.

The instinct of rivalry is usually appealed to by offering a prize. In order that the prize may serve to stimulate all the salesmen equally, it is necessary to fix upon a fair basis for measuring achievement. A careful investigation is made to determine the amount of sales which may be justly expected from each salesman under the conditions prevailing, making no allowance for the stimulating effect of the contest. In a recent contest, credit was given as follows on a 100 per cent basis: 20 per cent was given for the exemplification of real salesmanship, 20 per cent for the greatest volume of sales at a reasonable profit, 20 per cent for the best percentage of profit on a reasonable volume of sales, 10 per cent for the largest increase of old accounts, 10 per cent for the smallest volume of rejection and the least supervision necessary from the general sales offices, 10 per cent for the smallest volume of losses, 10 per cent for the greatest increase in permanent new accounts. A definite quota is assigned to each salesman. The prize is to be given to the one who makes the greatest percentage of increase in his quota. Each salesman is kept informed as to what all the others are doing.

If the prize is considerable in amount, it will appeal to the wealth interests.

Making the achievements of each salesman known to all the others, also arouses the spirit of rivalry.

It also stimulates the sociability interest, as it makes each put forth his best efforts in order that he may stand well with others. It says to him, in effect: "The world has no use for quitters and failures. Here is a race open to all, and no favoritism is shown. The best man will win. Are you the best man?"

A similar appeal may be combined with an appeal to the sociability interest, the spirit of co-operation, and of loyalty to the business. "You have been selected as a member of this selling organization because you have shown that you have ability, industry, and high business ideals. You have helped to make this business what it is. Will you help to make it better?"

In order that the sales contest may be a success, appeals must be directed definitely and effectively to certain specific instincts and interests. If instincts and interests are awakened to activity along the right lines, the fund of energy at the disposal of the salesmen will be greatly increased. Their feelings will be kindled. Their minds will work more actively. Effort will be concentrated on the things that count.

DEVELOPING CHARACTER AND PERSONALITY

SUCCESS DEPENDS UPON CHARACTER

The efficiency of a man in any line of business depends in large measure on the character he has formed. From his character come his strength and skill in influencing men and the respect he is able to inspire in the men with whom he comes in contact. The factors which are effective in inspiring respect are traits of character manifesting themselves in subtle, almost indescribable ways, in expression, words, tone, and acts. Through suggestion, one's character impresses itself on others, whether he wishes it or not. Holding the good will of people with whom one does business depends largely upon the treatment accorded them. The treatment will be as the character is. The character can not be bad and the acts regularly good. Good character is manifested in habitually according the right treatment to others.

Character grows out of the native tendencies and impulses, the instincts and interests, which we have already discussed, as they are developed into habits by the material and social environment. The objects to which our native impulses attach themselves, and the form which their development takes, depends upon educational influences, taking them in the

broad sense which includes all external influences which affect our life.

A man stamps his true value on himself. Hence, he must be what he wishes men to take him to be. No mask, or make-up, or attempt to play a part, will long prevent the inner man from impressing itself, through suggestion, on those with whom we deal. The world will take a man at the value he places on himself, provided he is not trying to float a lot of watered stock. One should strive rigorously and unflinchingly to be and do the things he ought to be and do.

Preparation for business efficiency consists in large part of developing character and personality.

Psychology is merely a descriptive science. It is interested solely in telling how the mind works and how character is developed. As a science, it has no concern to decide whether any particular habit is good or bad. To find out what traits of character are desirable, we must consult the conscience of the individual, the experience of society, educational theory, ethics, and religion. In the last analysis it will be found that the so-called bad acts are tabooed because they bring bad results. The good traits of character are so considered and esteemed because they further individual and social welfare. The best traits of character are the traits which make for the highest success.

Among the good traits of character are: honesty, industry, care of bodily well-being, cleanliness, per-

severance, thoroughness, punctuality, ambition, open-mindedness, thinking for one's self, progressive spirit, leadership, confidence, courage, cheerfulness, optimism, self-control, temperance, truthfulness, obedience, courtesy, sympathy, civility, loyalty, etc. The reader can add to this list as he pleases. A little reflection will convince him that he would regard none of the virtues as traits or elements of character, unless they were habitually manifested in conduct.

To find the strong and weak points in one's character requires careful and honest self-criticism. Much will be revealed in the advice of friends, the criticism of enemies, the treatment one receives from business associates, and one's success in dealing with others. In forming his character, one should be guided by the ideal of self-realization previously discussed. He should aim at an harmonious development of character and efficiency in all lines, with special attention to the matter with which he is most concerned.

Since a man's character is made up of native impulses developed into habits of thinking, feeling, and willing, the form that his character takes is to a large extent under his control. One can change his character by changing his habits. To give up old habits and form new ones, one must resolutely refuse to yield to the tendency to act in accordance with the old habit. Just as resolutely, and unhesitatingly, and invariably, he must improve every opportunity to act along the line of the new habit he desires to form.

This is so difficult that it is necessary to get the strongest possible hold on one's self at the start. But it grows much easier to act in the new way, as time elapses and the habit gets better formed. The new way, which at first required painful effort, later becomes pleasurable. It will finally require effort to act contrary to the new habit.

The most difficult thing in forming a new habit is to get strength and resolution enough to jerk one's self out of the old rut and get a good start in forming a new one. In time the habits will become a second nature, stronger than the original nature. Do not concern yourself with the undesirable habit you wish to eliminate from your character further than to refuse to give attention to the impulse to act along that line, or to allow the impulse to pass out into action.

SELF-CONFIDENCE

To make it clear how one can develop the more complex traits of character, and attitude of mind, let us consider self-confidence, which is of the utmost importance in every line of work. A firm spirit, manifested in confident and self-reliant attitude and in decisive action, compels respectful, and even considerate treatment from others. Show fear and you invite others to impose on you. There is much truth in the saying that men can win because they believe they can win. Energy in action follows naturally from self-confidence. To develop the self-confident feeling and bearing, decide carefully what you wish

to do and how to do it. Be thorough and painstaking in your preparation. Keep your purpose in view. Be on the alert for new points of view, new ideas, and new light on old ideas. You will thus acquire a fund of ideas and experience which will make you master of your line.

Give yourself good reason to think well of yourself, and then think well of yourself. You will thus develop self-confidence and initiative. Then do not stand around hesitating and irresolute. Go to work with an energy that never falters or turns aside.

Where there is a will there is a way.

Don't harbor feelings of doubt, or dwell on thoughts of inefficiency and failure. Most fears are groundless. Still more are worse than useless. By dreading a thing, you will be likely to contribute to bringing it to pass, and you will certainly increase its ill effects when it comes. Do not let your thoughts dwell on your shortcomings or chances of failure. A difficult situation once squarely faced loses most of its terror.

Overcome any tendency to diffidence or self-distrust by keeping your thoughts fixed on what you have to do, not on yourself. Keep before you the advantage and satisfaction which will come from succeeding. Study your failures only to find out how you can increase your proficiency, and then forget them. Think, instead, of future successes. Suggest to yourself frequently, "I am able to succeed. I will be self-confident. I will succeed."

To impress your self-confidence on others, manifest in your work, optimism, courage, confidence in your ability to succeed, intense earnestness, enthusiasm, and perseverance. Work without hesitation, in a thorough and honest manner. Avoid over-tension and convulsive efforts, as they manifest weakness and involve waste of energy. Give the impression of having plenty of time to accomplish your work. Appear confident of being able to handle the situation satisfactorily.

If you wish to be a successful man, you must assume the mental attitude and manner and bearing of a successful man. The successful leader of men shows self-reliance and conscious power in his manner, conversation, and carriage. He impresses men as believing in his ability to do great things. Men have confidence in one who believes in his own ability. They distrust one who lacks confidence in his own powers to secure good results.

PERSONAL MAGNETISM

This quality is so complex in its character as almost to defy analysis and explanation. The person who is described as possessed of magnetism will be found to manifest many of the following traits. He dresses tastefully in good clothes, well-pressed and cleaned, well-kept shoes and clean linen. He is well-shaved and bathed, and well-groomed. He speaks distinctly with a pleasant and well-modulated voice. His gestures and bearing are pleasing. He shows

courtesy and politeness by doing what is generally recognized as good form. He has consideration for others, and interest in their welfare, and in what they do and say. He has tact and avoids over-familiarity and weak flattery. He is cheerful, and cultivates the art of pleasing. He does the right thing, in the right way, and at the right time. He has easy confidence in himself, but is not conceited. He appears successful, shows mastery of his business and enthusiasm for it. At the same time he is interested in many other subjects, and well informed about them.

THE KEY TO SUCCESS

THE SCIENCE OF SALESMANSHIP
HOW TO DO BUSINESS
THE ART OF READING HUMAN NATURE

THE NEW

SALESMANSHIP

AND

HOW TO DO BUSINESS

BY

CHAS. LINDGREN

REVISED EDITION, WITH VALUABLE ADDITIONS BY

J. M. FITZGERALD, M. D.
President of the American Institute of Phrenology.

Personality in salesmanship is that force of mind which inspires belief. It is a force which springs from knowledge. The real salesman obtains results. To say the right thing at the right time requires good judgment and forethought. Ambition, enthusiasm, determination, resourcefulness and originality are essential to success.

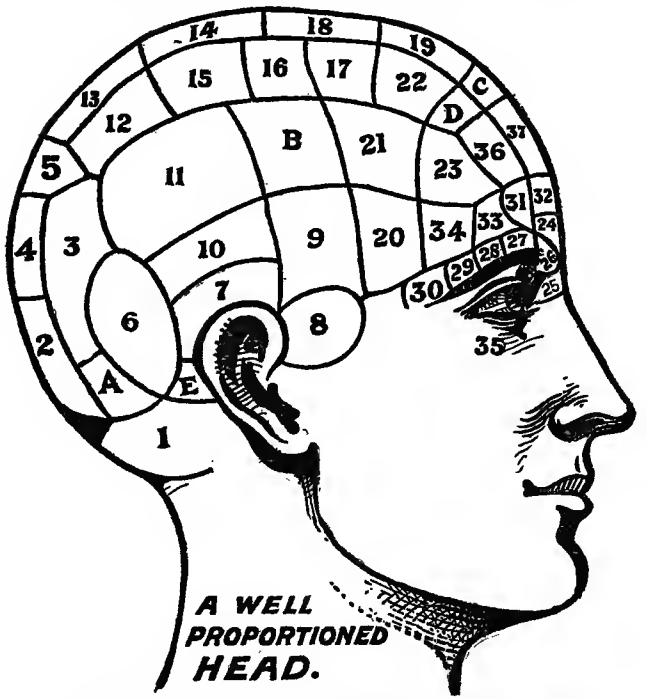
CHART OF THE HUMAN FACULTIES.



NUMBERS AND DEFINITIONS OF THE ORGANS.

1. Amativeness, Love between the sexes.
A. Conjugality, Matrimony—love of one.
2. Parental Love, Regard for offspring, pets, etc.
3. Friendship, Adhesiveness—sociability.
4. Inhabitiveness, Love of home.
5. Continuity, One thing at a time.
E. Vitativeness, Love of life.
6. Combativeness, Resistance—defense.
7. Destructiveness, Executiveness—force.
8. Alimentiveness, Appetite—hunger,
9. Acquisitiveness, Accumulation.
10. Secretiveness, Policy—management.
11. Cautiousness, Prudence—provision.
12. Approbativeness, Ambition—display.
13. Self-esteem, Self-respect—dignity.
14. Firmness, Decision—perseverance.
15. Conscientiousness, Justice—equity.
16. Hope, Expectation—enterprise.
17. Spirituality, Intuition—faith—credulity.
18. Veneration, Devotion—respect.
19. Benevolence, Kindness—goodness.
20. Constructiveness, Mechanical ingenuity.
21. Ideality, Refinement—taste—purity.
B. Sublimity, Love of grandeur—infinitude.
22. Imitation, Copying—patterning.
23. Mirthfulness, Jocoseness—wit—fun.
24. Individuality, Observation—desire to see.
25. Form, Recollection of shape.
26. Size, Measuring by the eye.
27. Weight, Balancing—climbing.
28. Color, Judgment of colors.
29. Order, Method—system—arrangement.
30. Calculation, Mental arithmetic.
31. Locality, Recollection of places.
32. Eventuality, Memory of facts.
33. Time, Cognizance of duration.
34. Tune, Sense of harmony and melody.
35. Language, Expression of ideas.
36. Causality, Applying causes to effect.
37. Comparison, Inductive reasoning—illustration.
C. Human Nature, Perception of motive.
D. Agreeableness, Pleasantness—suavity.

The Various Temperaments

The salesman should become so proficient in the study of human nature, that he can, in less than a half minute, tell the predominant element of temperament in his prospective buyer, that he may not only get that person's attention, but awaken and hold his interest while he presents and explains the merits and acceptable side of his goods, or article. The surest method to pursue is to study the phrenological system of temperaments. We will classify them briefly under three heads, viz., The mental or thought producing, the motive, or will type, the vital or feeling type. These have an anatomical and physiological basis and are very simple and comprehensive.

The Mental temperament embraces the brain and nervous system and is the instrument through which mind is manifested and developes sensation, emotion, thought and feeling. A person in whom the mental temperament predominates has a very large head for the body. The forehead is large, being broad and high; the upper sidehead is expanded, the base of the brain is narrow and small; the face is pyriform in shape, the features are delicately cut, if not sharp; the countenance is mobile and very expressive; the skull delicate and thin, as are all the bones of the body. The figure is not strongly marked like the motive temperament; seldom imposing, but may be graceful and elegant; the muscles are small and com-

pact in quality, adapted to rapid action rather than strength. In short the whole structure is distinguished for its fineness and delicacy. Such persons are very quick in their motions and have great sensitiveness to pain and suffering. They will be inclined to study, think, write, teach and speak; to do indoor head work in preference to manual labor. The mind will generally predominate over the body and with fair culture, the person will be clear-headed, intense, susceptible to enjoyment and suffering and to every internal and external influence. The brain makes the whole body its servant and hence the whole body is the medium of mental manifestation. If the brain is larger in proportion than the body it is liable to exhaust the body, because the exhausting power is in the brain. It is proper to call this temperament mental rather than nervous. Some are nervous because they have taken strong tea, coffee, tobacco, or other poisons, and also from over work, dissipation or bereavement of family or friends; in these cases the nervous system is keyed up too high. But the mental being dependent upon nerve, is indicated when there is a predominance of brain and nervous force over bone and vitality.

Mental.

The Motive temperament is indicated by large bones, strong, hard muscles, prominent joints and an angular figure, usually associated with more than average height;

the shoulders are broad, the abdomen is moderate in fullness, the face is oblong, the cheek bones are rather high, the jaws large, the teeth strong, the features in general rugged and prominent. The expression of the face is striking, it is strong, earnest, determined and probably severe and stern. In proportion as there are good bones and muscles there is power in the constitution, power to endure, to sustain hardship, to overcome obstacles in the way. It is the machinery of the body. A man who has a strong, muscular frame will walk rather than ride and will delight to take active exercise. The motive temperament is connected with action, motion, endurance, hardihood and toughness. This temperament inclines a person to labor, to be industrious, to desire constant employment and to work without fatigue. They are not so polished and refined in their manners, with the same opportunities for mingling in refined society, the same amount of training and discipline as those who have the mental temperament. They are more thorough, plodding, tenacious, direct, plain, practical, efficient and persevering.

Motive.

The Vital Temperament.

The vital includes three classes of organs, the lymphatics, the blood vessels and the glands, which, through their function of absorption, circulation and secretion,

are the source of the body's nourishment and purification. Persons of the vital temperament are characterized by stature of medium height and by breadth of body, rather than height. The bones and muscles are not so heavy or strongly developed as in the motive temperament. The chest is full, the abdomen rounded and large, the limbs plump and tapering, the hands and feet relatively small, the neck comparatively short and thick, and the face corresponds with the other parts, and is well filled out with adipose tissue, while the expression is lively, frank and good natured. As Washington Irving puts it, "who ever saw a fat man leading a riot?" They tend toward physical activity with mental facility and versatility, are distinguished for elasticity, rather than firmness, for more diligence than persistency. They have a ready perception and an active imagination and express themselves with quickness and brilliancy.

Vital.

A balance of power in the organization is much more desirable. We need a framework of good bones and muscles as well as good nerves and a healthy brain. We have spoken of these temperaments when each has been predominant, and the other two rather neutral in the individual. It is a very common thing for a person to possess two of the temperaments quite harmoniously developed and the third very deficient. Then again an occasional man or woman who is blessed with a perfect

blending of the three; they have what we term a balanced temperament. They have a good sized, well proportioned head, rather large bones and powerful muscles, and the vital organs are large enough to round out the body. Such as are thus fortunately organized, if properly educated and trained to industry and thrift are capable of turning their head and hand to any line of thought and work with almost equal facility and success of effort.

The Kinds of Salesmanship to Which the Various Temperaments are Adapted.

Men of the mental temperament who wish to become salesmen should adapt themselves to things that call for active sensibilities and artistic tastes, such as fine clothing, gentlemen's furnishings, books, dry goods, art goods, etc. The motive temperament should deal in something that has resistance and strength, where endurance and use is the chief quality and that is of practical every-day demand and necessity, for instance, mechanical things, hardware or machines, building materials, factory supplies, grains, horses, cattle, etc. The vital temperament is adapted to the selection of anything good to eat or drink, the drug business or practical household and hotel necessities. They are also well adapted to the dealing in clothing if they possess enough of ideality and perception to give taste and quickness of

Balanced.

discrimination and approbative enough to make them desire to dress well. One may, in fact the majority of people do, possess one of these elements slightly in the lead. Two elements of temperament may be well represented and the third weak, they could, therefor, choose according to the combination they possess. The person who has the three elements of temperament so combined as to produce a harmonious and well balanced organization,—we mean by this where the intellect, feelings and will are all fairly uniform in power,—can select from the whole field of things that are to occupy the salesman's attention and if a careful selection is made and thoroughly studied, he can, other things being equal, feel certain of achieving success.

Analysis of Values.

For those who are beginning as salesmen, it would be wise to form an estimate of a thing according to the following four laws, since these give all the talking points for buying or selling a thing, i. e., suppose you were buying a suit of clothes, the first thing that should be considered is the kind of material (first the amount, second the state, that is, whether it is old or new material, well dyed or poorly dyed); second, the make or manufacture, whether the suit is finely tailored, moderate or indifferent, hand sewed or machine made; third, the durability, which depends upon the foregoing points; fourth, the use, which includes the term desirability, that is, is it a winter suit, summer suit, dress suit, business suit, hunting suit, etc., is it this year's style or last year's style, etc. One can analyze out the value of anything by applying these four laws in the order in which they are given.

Many young men are not highly developed in the faculty of combativeness and in order to become good salesmen they require this faculty brought into positive function that they may not give up or become undecided and discouraged. Combativeness functions through the shoulder and arm muscles, as shown by the soldier, prize-fighter, athlete, etc., and when well developed, it imparts a feeling of enthusiasm, physical vigor and power of decision that no other faculty can give. The best way then, of bringing it into proper function is to take up some form of exercise that will call into use the shoulder and arm muscles, each morning immediately upon arising, devoting ten or fifteen minutes to this. The same amount of time may be devoted with profit in the evening, if one feels the extra need. Again, the faculty can be brought into function by tackling one's hardest task first and doing it in a positive manner.

Whenever one feels that they are becoming excited or that they are likely to lose control of themselves, they should practice slow deep breathing, breathing about twelve times a minute, the usual number of breaths being from nineteen to twenty-one. The vagus nerve, which controls the movement of the lungs, heart and stomach, can be set into function to check off the activity of the heart beat by slow rhythmic breaths. In that way the heart does not pump into the base of the brain an excessive quantity of blood, giving either a feeling of excitement, anger or confusion. This is of importance if one is going to call upon a person whom they know to be easily excited or to lose control of their temper.

IMPORTANT.

FACULTIES OF THE BRAIN ANALYZED AND DESCRIBED.

In the following analysis and description of the faculties of the human brain is first given a list of the qualities which go to make up the respective faculties, and then follows a description of the characteristics of the persons in whom these faculties are large or small. The locations of these faculties in the brain are shown by the chart at the front of the book.

ACQUISITIVENESS.

Qualities: Economy; frugality; the acquiring, saving, and hoarding instinct; laying up a surplus, and allowing nothing to be wasted; desire to possess and own; the mine and thine feeling; claiming of one's own things; love of trading and amassing property. Adapted to man's laying up the necessaries and comforts of life against a time of future need. Perversion—A miserly-grasping, close-fisted penuriousness.

Large.—Save for future use what is not wanted for present; allow nothing to go to waste; turn everything to a good account; buy closely and make the most of every-

thing; are industrious, economical, and vigorously employ all means to accumulate property, and desire to own and possess much; with large social organs, industriously acquire property for domestic purposes, yet are saving in the family; with very large Adhesiveness (Friendship) and Benevolence, are industrious in acquiring property, yet spend it too freely upon friends; with large Hope added, are too apt to indorse for them; with small secretiveness, and activity greater than power, are liable to overdo, and take on too much work in order to save so much, as often to incur sickness, and thus lose more than gain; with large Approbativeness and small Secretiveness, boast of wealth, but with large Secretiveness, keep pecuniary affairs secret; with large Constructiveness, incline to make money by engaging in some mechanical branch of business; with large Cautiousness, are provident; with large Ideality, keep things very nice, and are tormented by whatever mars beauty; with large intellectual organs, love to accumulate books, and whatever facilitates intellectual progress; with large Veneration and Self-Esteem, set great store on antique and rare coins, and specimens, etc.

Small.—Hold money loosely; spend it often without getting its value; care little how money goes; with Hope very large, enjoy money today without saving for tomorrow; and with large Approbativeness and Ideality added, and only average Causality, are prodigal, and spend money to poor advantage; contract debts without providing for their payment, etc.

Agreeableness (Suavity).

Qualities: Persuasiveness, pleasantness, blandness, adapted to please and win others.

Large.—Have a pleasing, persuasive, conciliatory mode of addressing people, and of saying things; with Adhesiveness (Friendship) and Benevolence large, are generally liked; with Comparison and Human Nature large, say unacceptable things in an acceptable manner, and sugar over expressions and actions.

Small.—Say even pleasant things very unpleasantly, and fail sadly in winning the good graces of people.

Alimentiveness.

Qualities: Appetite; the feeding instinct; relish for food; hunger. Adapted to man's need of food, and creating a disposition to eat. Perverted, it produces gormandizing and gluttony, and causes dyspepsia and all its evils.

Large.—Have a hearty relish for food; set high value upon table enjoyments, and solid, hearty food; with Acquisitiveness large, lay up abundance of food for future use—perhaps keep so much on hand that some of it spoils; with Ideality large, must have everything clean about the table and have food nicely cooked; with large Language and Intellect, enjoy table-talk exceedingly, and participate in it; with large social faculties, must eat with others; can cook well, practiced in culinary, apt to be ceremonious and over-polite at table, etc. Such should

restrain this faculty by eating more slowly, and often less.

Small.—Eat with "long teeth" and little relish; hardly know or care what or when they eat; and should pay more attention to duly feeding the body.

Amativeness.

Qualities: Sexuality; the love element; attached to the opposite sex; desire to love, be loved, and marry.

Large.—Are sexed, or much of a man or woman; that is, have the form, carriage, spirit, manners and mind of the true man or woman in a high degree; are eminently both loving and lovely; are full of love, and with Conjugality large, of the real conjugal sentiment and intuition; strongly attract, and are strongly attracted by, the opposite sex; admire and love their beauty and excellences; easily win their affectionate regards, or kindle their love; have many warm friends, if not admirers, among them; love young and intensely, and are more powerfully influenced by the love elements for good or evil, according as it is well or ill-placed; with Adhesiveness (Friendship) and Conjugality large, will mingle pure friendship with devoted love; cannot flourish alone, but must have a matrimonial mate with whom to become perfectly identified, and whom to invest with almost superhuman perfections, by magnifying their charms and overlooking their defects; in the sunshine of whose love be perfectly happy, but proportionally miserable without it.

Small.—Dislike the opposite sex, and distrust and refuse to assimilate with them; feel little sexual love, or desire to marry; are cold, coy, distant, and reserved toward the other sex; experience but little of the beautifying and elevating influence of love, and should not marry, because incapable of appreciating its relations and making a companion happy.

Approbativeness.

Qualities: Regard for character, appearances, etc.; love of praise; desire to excel and be esteemed; ambition; affability; politeness, desire to display and show off; sense of honor; desire for a good name, for notoriety, fame, eminence, distinction, and to be well thought of; pride of character; sensitiveness to the speeches of people; and love of popularity. Adapted to the reputable and disgraceful. Perversion—Vanity; affectation; ceremoniousness; aristocracy; pomposity; eagerness for popularity, outside display, etc.

Large.—Love commendation, and are cut by censure; are keenly alive to the smiles and frowns of public opinion; mind what people say; strive to show off to advantage, and are affable, courteous, and desirous of pleasing; love to be in company; stand on etiquette and ceremony; aspire to do and become something great; set much by appearances, and are mortified by reproach; with large Cautiousness and moderate Self-Esteem, are careful to take the popular side, and fear to face ridicule of others; yet, with Conscientiousness and Combativeness large,

stick to the right, though unpopular, knowing that it will ultimately confer honor.

Small.—Care little for the opinions of others, even of friends; are comparatively insensible to praise; disregard style and fashion; despise etiquette and formal usages; never ask what will persons think, and put on no outside appearances for their own sake.

Benevolence.

Qualities: Sympathy; kindness; humanity; desire to make others happy; a self-sacrificing disposition; philanthropy; generosity; the accommodating, neighborly spirit. Adapted to man's capability of making his fellowmen happy. Perversion—Misplaced sympathies.

Large.—Delight to do good; make personal sacrifices to render others happy; cannot witness pain or distress, and do what can well be done to relieve them; manifest a perpetual flow of disinterested goodness; with largee Adhesiveness (Friendship), Ideality, and Approbativeness, and only average propensities and Self-Esteem, are remarkable for practical goodness; live more for others than self; with large domestic organs, make great sacrifices for family; with large reflectives, are perpetually reasoning on the evils of society, the way to obviate them, and to render mankind happy.

Small.—Care little for happiness of man or brute, and do still less to promote it; make no disinterested self-sacrifices; are callous to human woe; do few acts of kindness, and those grudgingly, and have unbounded selfishness.

Calculation.

Qualities: Cognizance of numbers; ability to reckon figures in the head; mental arithmetic. Adapted to the relations of numbers.

Large.—Excel in mental arithmetic, in adding, subtracting, multiplying, dividing, reckoning figures, casting accounts, etc., in the head; with large perceptives, have excellent business talents; and large Locality and Causality added, excel in mathematics.

Small.—Are dull and incorrect in adding, subtracting, dividing, etc.; dislike figuring; are poor in arithmetic, both practical and theoretical, and should cultivate this faculty.

Causality.

Qualities: Perception and application of causation; thought, originality; comprehensiveness of mind; forethought and resource-creating power; adaptation of ways and means to ends. Adapted to nature's institutes, plans, cause, and effect. Perverted, it reasons in favor of untruth and injurious ends.

Large.—Desire to know the why and wherefore of things, and to investigate their laws; reason clearly and correctly from causes to effects, and from facts to their causes; have uncommon capabilities of planning, contriving, inventing, creating, being resourceful, and making the head save the hands; kill two birds with one stone; predicate results, and arrange things so as to succeed; synthetize, and put things together well.

Small.—Are deficient in reasoning and planning

power; need perpetual telling and showing; seldom arrange things beforehand, and then poorly; should work under others; lack force of idea and strength of understanding.

Cautiousness.

Qualities: Carefulness; watchfulness; prudence; provision against want and danger; solicitude, anxiety; apprehension; security; protection; avoiding prospective evils; the sentinel. Adapted to ward off surrounding dangers, and make those provisions necessary for future happiness. Perversion—Irresolution; timidity; procrastination; indecision; fright; panic.

Large.—Are always on the lookout; take ample time to get ready; provide against prospective dangers; make everything safe; guard against losses and evils; incur no risks; sure bind that they may sure find; with large Combativeness, Hope, and an active temperament, drive, Jehu-like, whatever is undertaken, yet drive cautiously; lay on the lash, yet hold a tight rein, so as not to upset plans.

Small.—Are rash, reckless, luckless; and with large Hope, always in trouble; with large Combativeness, plunge headlong into difficulties in full sight, and should assiduously cultivate this faculty.

Color.

Qualities: Perception, recollection, and application of colors, and delight in them. Adapted to that infinite

variety of coloring interspersed throughout nature. Perverted—Are over-particular to have colors just right.

Large—Can discern and match colors by the eye with accuracy; with Comparison large, can compare them closely, and detect similarities and differences; with Constructiveness, Form, Size and Imitation large, can excel in painting.

Small.—May tell the primary colors from each other, yet rarely notice the color of dress, eyes, hair, etc.; can not describe persons and things by them, and evince a marked deficiency in coloring, taste, and talent.

Combativeness.

Qualities: Resistance-opposition; defense; defiance; boldness; courage; spirit; desire to encouunter; self-protection; presence of mind; determination; get-out-of-my-way; let-me-and-mine-alone. Adapted to man's requisition for overcoming obstacles, contending for rights, etc. Perversion—Anger; contrary; fault-finding; contention; ill-nature; and fighting.

Large.—Are bold, resolute, fearless, determined, disposed to grapple with and remove obstacles, and drive whatever is undertaken; love debate and opposition; are perfectly cool and intrepid; have great presence of mind in times of danger, and nerve for encounter.

Small.—Are inert and inefficient; can accomplish little; never feel self-reliant or strong; and with large moral and intellectual organs, are too gentle and easily satisfied; with large Cautiousness, run to others for protection, and are always complaining of bad treatment.

COMPARISON.

Qualities: Inductive reasoning; ability and disposition to analyze, classify, compare, draw inferences, etc. Perverted—Is too redundant in proverbs, fables, and figures of speech.

Large.—Reason clearly and correctly from conclusions and scientific facts up to the laws which govern them; discern the known from the unknown; detect error by its incongruity with facts; have excellent talent for comparing, explaining, expounding, criticising, exposing, etc.; employ similes and metaphors well; put this and that together, and draw correct inferences from them.

Small.—Have a poor talent for drawing inferences; lack appropriateness in everything, and should cultivate this faculty.

CONJUGALITY.

Qualities: Monogamy; Union for Life; the pairing instinct; attachment to one conjugal partner; duality and exclusiveness of love. Perverted action—A broken heart; jealousy; envy towards love rivals.

Large.—Seek one, and *but* one, sexual mate; experience the keenest disappointment when love is interrupted; are restless until the affections are anchored; are perfectly satisfied with the society of that one; and should exert every faculty to win the heart and hand of the one beloved, nor allow anything to alienate the affections.

Small.—Have but little conjugal love, and seek the promiscuous society and affection of the opposite sex, rather than a single partner for life. Would incline to

regard an engagement as a kind of bondage, and would prefer to have no positive engagement until the near approach of the marriage.

Conscientiousness.

Qualities: Moral principle; integrity; perception and love of right; innate sense of accountability and obligation; love of justice and truth; regard for duty; desire for moral purity and excellence; disposition to fulfill promises, agreements, etc.; that internal monitor which approves the right and condemns the wrong; sense of guilt; penitence; contrition; desire to reform. Perverted —It makes one do wrong from conscientious scruples, and torments with undue self-condemnation.

Large.—Love the right as right, and hate the wrong because wrong; are honest, faithful, upright in motive; mean well; consult duty before expediency; feel guilty when conscious of having done wrong; ask forgiveness for the past, and try to do better in the future; with strong propensities, will sometimes do wrong, but be exceedingly sorry therefor; and, with a wrong education added, are liable to do wrong, thinking it right, because these propensities warp conscience, yet mean well; with large Cautiousness, are yet solicitous to know what is right, and careful to do it; with weaker Cautiousness, sometimes do wrong carelessly or indifferently, yet afterwards repent it.

Constructiveness.

Qualities: The making instinct; the tool-using talent; slight of hand in constructing things. Adapted to a man's need of things made, such as houses, clothes, and manufactured articles of all kinds. Perverted—It wastes time and money on perpetual motion and other futile inventions.

Large.—Love to make, are able and disposed to tinker, mend, and fix up, build, manufacture, employ machinery, etc.; show mechanical skill and dexterity in whatever is done with the hands; with large Causality and Perceptives, are inventive.

Small.—Are deficient in the tool-using capability; awkward in making and fixing up things; poor in understanding and managing machinery; take hold of work awkwardly and wrong end first; write poorly and lack both mental and physical construction.

Continuity.

Qualities: A patient dwelling upon one thing until it is done; consecutiveness and connectedness of thought and feeling. Adapted to a man's need of doing one thing at a time. Perversion—Prolixity, repetition, and excessive exemplification.

Large.—Give the whole mind to one thing in hand till it is finished; complete at the time; keep up one common train of thought, or current of feeling, for a long time; are disconcerted if attention is directed to a second object, and cannot duly consider either.

Small.—With activity great, commence many things, yet finish few; crave novelty and variety; have many irons in the fire; lack application; jump rapidly from promise to conclusion, and fail to connect and carry out ideas; lack steadiness and consistency of character; may be brilliant, yet cannot be profound; fly rapidly from one thing to another; have many good thoughts, yet they are scattered; and talk on a great variety of subjects in a short time, but fail sadly in consecutiveness of feeling, thought and action.

Destructiveness.

Qualities: Executiveness; severity; sternness; the destroying and pain causing faculty; harshness; extermination; indignation; disposition to break, crush and tear down; the walk-right-through spirit. Adapted to man's destroying whatever is prejudicial to his happiness; performing and enduring surgical operations; undergoing pain, etc. Perversion—Wrath; revenge; malice; disposition to murder, etc.

Large.—Impart that determination, energy, and force which remove or destroy whatever impedes progression; with Firmness large, give that iron will which adheres to the very last, in spite of everything, and carry points anyhow.

Small.—With large moral faculties, posses too tender a soul to enjoy our world as it is, or to endure hardships or bad treatment; can neither endure or cause suffering, anger being so little as to provoke only ridicule, and need hardness and force.

Eventuality.

Qualities: Memory of facts; recollection of circumstances, news, occurrences, and historical, scientific and passing events; what has been said, seen, heard, or once known. Adapted to action, or those changes constantly occurring around or within us.

Large.—Have a clear and retentive memory of historical facts, general knowledge, what has been seen, heard, read, done, etc., even in detail considering advantages, are well informed and knowing; desire to witness and institute experiments; find out what is and has been, and learn anecdotes, particulars, and items of information, and readily recall to mind what has once entered into it; have a good general matter-of-fact memory, and pick up facts readily.

Small.—Have a treacherous and confused memory of circumstances; often forget what is wanted, what was intended to be said, done, etc.; have a poor command of knowledge, are unable to swear positively to details, and should strenuously exercise this remembering power.

Firmness.

Qualities: Stability; decision; perseverance; fixedness of purpose; tenacity of will, and aversion to change. Adapted to man's requisition for holding out to the end. Perversion—Obstinacy; willfulness; mulishness; stubbornness; unwillingness to change even when reason requires.

Large.—Are set and willful; stick to and carry out

what is commenced; hold on long and hard; continue to the end, and may be fully relied upon.

Small.—With activity great, and the head uneven, are fitful, impulsive, and, like the weather-vane, shift with every changing breeze, and are ruled by the other faculties, and as unstable as water.

Form.

Qualities: Cognizance and recollection of shape; memory of countenances and the looks of persons and things seen; perception of resemblances, family likenesses, etc. Adapted to shape. Perverted—Sees imaginary shapes of persons, things, etc., as in delirium tremens.

Large.—Notice, and for a long time remember, the faces, countenances, forms, looks, etc., of persons, beasts and things once seen; know by sight many whose names are not remembered.

Small.—Have a poor recollection of persons, looks, etc.; often meet persons the next day after an introduction, or an evening interview, without knowing them; with Eventuality large, may remember their history, but not their faces; with Locality large, where they were seen, but not their looks, etc.

Friendship (Adhesiveness).

Qualities: Social feeling; love of society; desire to congregate, associate, visit, seek company, entertain friends, form and reciprocate attachments, and indulge the friendly feelings. When perverted it forms attach-

ments for the unworthy, and leads to bad company. Adapted to man's requisition for concert of action, co-partnership, combination, and community of feeling and interest, and is a leading element of social relations.

Large.—Are cordial, and ardent as friends; readily form friendship, and attract friendly regards in return; must have society of some kind; with Benevolence large, are hospitable, and delight to entertain friends; with the moral faculties large, seek the society of the moral and elevated, and can enjoy the friendship of no others; with the intellectual faculties large, seek the society of the intelligent; with Alimentiveness large, love the social banquet, and set the best before friends.

Small.—Think and care little for friends; dislike co-partnership; are cold-hearted, unsocial, and selfish; take little delight in company, but prefer to be alone; have few friends, and, with large selfish faculties, many enemies, and manifest too little of this faculty to exert a perceptible influence upon character.

Hope.

Qualities: Expectation; anticipation of future success and happiness. Adapted to man's relations with the future. Perverted, it becomes visionary and castle-building.

Large.—Expect much from the future; contemplate with pleasure the bright features of life's picture; never despond; overrate prospective good, and underrate and overlook obstacles and evils; calculate on more than the

nature of the case will warrant; expect, and hence attempt, a great deal, and are therefore always full of business; are sanguine, and rise above present trouble by hoping for better things in future, and though disappointed, hope on still; build some air-castles, and live in the future more than present.

Small.—Expect and undertake very little; with large Cautiousness, put off till it is too late; are always behind; may embark in projects after everybody else has succeeded, but will then be too late, and in general knock at the door just after it has been bolted.

Human Nature.

Qualities: Discernment of character; perception of motives; intuitive physiognomy. Adapted to man's need of knowing his fellow-men. Perverted, it produces suspiciousness.

Large.—Read men intuitively from their looks, conversation, manners, and walk, and other kindred signs of character; with Individuality and Comparison large, notice all the little things they do, and form a correct estimate from them, and should follow first impressions respecting persons; with full Secretiveness and Benevolence added, know just how to take men, and possess much power over mind; with Mirthfulness and Ideality large, see all the faults of people, and make much fun over them; with comparison large, have a talent for metaphysics, etc.

Small.—Are easily imposed upon by others; with large

Conscientiousness and small Secretiveness, think every body tells the truth; are too confiding, and fail sadly in knowing where and how to take things.

Ideality.

Qualities: Perception and admiration of the beautiful and perfect; good taste and refinement; purity of feeling; sense of propriety, elegance, and gentility; polish and imagination. Adapted to the beautiful in nature and art. Perverted, it gives fastidiousness and extra niceness.

Large.—Appreciate and enjoy beauty and perfection wherever found, especially in nature; give grace, purity and propriety to expression and conduct, gracefulness and polish to manners, and general good taste to all they say and do; are pure-minded; enjoy the ideal of poetry and romance.

Small.—Show a marked deficiency in whatever appertains to taste and style, also to beauty and sentiment.

Imitation.

Qualities: Ability and disposition to copy, take pattern and imitate. Adapted to man's requisition for doing, talking, acting, etc., like others. Perverted, it copies even their faults.

Large.—Have a great propensity and ability to copy and take pattern from others, and do what is seen done; describe and act out well.

Small.—Copy even commonplace matter with extreme

difficulty and reluctance, and generally do everything in their own way.

Individuality.

Qualities: Observation; desire to see and examine; cognizance of individual objects. Adapted to individual existence, or the thingness of things. It is the door through which most forms of knowledge enter the mind. Perverted, it makes the starer and the impudently observing.

Large.—Have a great desire to see, know, examine, experience, etc.; are great and practical observers of men and things; see whatever is transpiring around, what should be done, etc.; are quick of perception, and with large Acquisitiveness, quick to perceive whatever appertains to property.

Small.—Observe only what is thrust upon the attention, and are quite deficient in this respect.

Inhabitiveness.

Qualities: The home feeling; love of house, the place where one was born or has lived, and of home associations. Adapted to man's need of an abiding place, in which to exercise the family feelings; patriotism. Perversion—Homesickness, when away from home, and needless pining after home.

Large.—Have a strong desire to locate young, to have a home or room exclusively; leave room with great reluctance, and return with extreme delight; soon become

attached to house, sleeping-room, garden, fields, furniture, etc.; highly prized domestic associations, and are not satisfied without a place on which to expend his home instinct.

Small.—Care little for home; leave it without much regret.

Language.

Qualities: The expression of all mental operations by words, written or spoken, by gestures, looks, and actions; the communicating faculty and instinct in general. Adapted to man's requisition for holding communication with man. Perversion—Verbosity, pleonasm, circumlocution; excessive talkativeness, telling what does harm, etc.

Large.—Express ideas and feelings well, both verbally and in writing; can learn to speak languages easily; recollect words, and commit to memory well; have freedom, copiousness, and power of expression.

Small.—Have poor lingual and communicative talents; hesitate for words; speak with extreme difficulty and very awkwardly, and should cultivatae this faculty by talking and writing much.

Locality.

Qualities: Cognizance of place; recollection of the looks of places, roads, scenery, and the location of objects; where on a page ideas are to be found, and position generally; the geographical faculty; desire to see

places, and have the ability to find them. Adapted to nature's arrangement to space and place. Perverted, it creates a cosmopolitic disposition, and would spend everything in traveling.

Large.—Remember the whereabouts of whatever they see; can carry the points of the compass easily in the head, and are lost with difficulty either in the city, woods or country; desire to see places, and never forget them; study geography and astronomy with ease, and rarely forget where things are seen.

Small.—Are decidedly deficient in finding places, and recollect them with difficulty, even when perfectly familiar with them.

Mirthfulness.

Qualities: Intuitive perception of the absurd and ridiculous; disposition and ability to joke and make fun, and laugh at what is improper, ill timed or unbecoming; pleasantness; facetiousness. Adapted to the absurd, inconsistent, and laughable. Perverted, it makes fun on solemn occasions, and when there is nothing ridiculous at which to laugh.

Large.—Enjoy a hearty laugh at the absurdity of others exceedingly, and delight to make fun out of everything not exactly proper or in good taste, and are always ready to give a good joke as get.

Small.—Make very little fun; are slow to perceive, and still slower to return jokes; seldom laugh, and think it foolish or wrong to do so.

Order.

Qualities: Method, system, arrangement. Adapted to Heaven's first law. Perverted, it overworks, annoys others to keep things in order, and is tormented by disarrangement.

Large.—Have a desire to conduct business on methodical principles, and to be systematic in everything.

Small.—Have a very careless, inaccurate way of doing everything; take a long time to get ready; can never find what is wanted, and have everything in perpetual confusion.

Parental Love.

Qualities: Attachment to one's own offspring; love of children, pets, and animals generally, especially those young or small; adapted to that infantile condition in which man enters the world, and to children's need of parental care and education. This faculty renders children the richest treasure of their parents, casts into the shade all the toil and expense they cause, and lacerates them with bitter pangs when death or distance tears them asunder. It is generally much larger in woman than in man; and nature requires mothers to take the principal care of infants. Perverted, it spoils children by excessive indulgence, pampering, and humoring.

Large.—Love their own children devotedly; value them above all price, cheerfully endure toil and watching for their sake; forbear with their faults, and win their love.

Small.—Care little for their own children, and still less for those of others.

Secretiveness.

Qualities: Self-government; ability to restrain feelings; policy; cunning; adapted to man's requisition for controlling his animal nature. Perverted, it causes duplicity, double-dealing, lying, deception, and all kinds of false pretensions.

Large.—Incline to throw a veil over countenance, expression and conduct; appear to aim at one thing, while accomplishing another; love to surprise others; are guarded, politic, shrewd, managing, employ concealment, and are hard to be found out.

Small.—Are very transparent; seem to be just what and all they realy are; disdain concealment in all forms; carry the soul in the hands and face, and make way directly to the feelings of others, because expressing them so unequivocally.

Self-Esteem.

Qualities: Self-appreciation and valuation; self-respect; self-reliance; magnanimity; nobleness; independence; dignity; self-satisfaction and complacency; love of liberty and power; an aspiring, self-elevating, ruling instinct; pride of character; manliness; lofty-mindedness, and desire for elevation. Adapted to the superiority, greatness and exalted dignity of human nature. Perversion — Egotism; hauteur, forwardness; tyranny; superciliousness; imperiousness.

Large.—Put a high estimate upon self—sayings,

doings, capabilities; fall back upon your own unaided resources; will not take advice; are high-minded, and will never stoop, or demean self.

Small.—Feel diminutive; lack elevation and dignity of tone and manner; place too low estimate on self, and with Approbativeness large, are too anxious to appear well in the eyes of others; lack self-confidence; underrate self, and are therefore undervalued by others, and feel insignificant, as if in the way, or trespassing upon others; should cultivate this faculty.

Spirituality.

Qualities: Faith; prescience; the "light within"; trust in prophetic guidings; perception and feeling of the spiritual; interior perception of truth, what is best, what is about to transpire, etc. Adapted to man's prophetic gift and a future life. Perversion—Superstition; witchcraft; and with Cautiousness large, fear of ghosts.

Large.—Perceive and know things independent of the senses and intellect, or, as it were, by prophetic intuition; experience an internal consciousness of what is best, and that spiritual communion which constitutes the essence of piety; love to meditate; experience a species of waking clairvoyance, as it were "forewarned."

Small.—Perceive spiritual truths so indistinctly as rarely to admit them; are not guided by faith, because so weak; must see the fullest proof before believing; have no premonitions, and disbelieve in them.

Sublimity.

Qualities: Perception and appreciation of the Vast, Illimitable, Endless, Omnipotent and Infinite. Adapted to that infinitude which characterizes every department of nature. Perverted, it leads to bombast, and a wrong application of extravagant words and ideas.

Large.—Appreciate and admire the grand, sublime, vast and magnificent in nature and art.

Small.—Show a marked deficiency in this respect, and should earnestly cultivate it.

Size.

Qualities: Cognizance of bulk, magnitude, quantity, proportion, etc., ability to measure by the eye. Adapted to the absolute and relative magnitude of things. Perverted, it is pained by disproportion and architectural inaccuracies.

Large.—Have an excellent eye for measuring angles, proportions, disproportions, and departures therefrom. This faculty is necessary to artisans, mechanics, and all kinds of dealers, students, etc.

Small.—Are obliged always to rely on actual measurements, because the eye is too imperfect to be trusted.

Time.

Qualities: Cognizance and recollection of duration and succession, the lapse of time, when things occurred, etc., and ability to carry the time of the day in the head;

punctuality. Adapted to periodicity. Perverted, it is excessively pained by bad time in music and not keeping step in walking, etc.

Large.—Can generally tell when things occurred, at least the order of events, and the length of time between one occurrence and another, etc.; tell the time of day without time-piece or sun well, and keep an accurate chronology in the mind of dates general and particular.

Small.—Fail to keep the correct time in the head or awaken at appointed times; have a confused and indistinct idea of the time when things transpired, and forget dates.

Tune.

Qualities: The music instinct and faculty; ability to learn and remember tunes by rote. Adapted to the musical octave. Perversion—Excessive fondness for music to the neglect of other things.

Large.—Love music dearly; have a nice conception of concord, discord, melody, etc., and enjoy all kinds of music, and with large Imitation, Constructiveness, and Time, can make most kinds, and play well on musical instruments.

Small.—Learn to sing or play tunes with great difficulty, and that mechanically, without emotion or effect.

Veneration.

Qualities: Devotion; adoration of a Supreme Being; reverence for religion and things sacred; disposition to

pray, worship, and observe religious rites. Adapted to the existence of a God, and the pleasures and benefits experienced by man in worshiping him. Perverted, it produces idolatry, superstitious reverence for authority, bigotry, religious intolerance, etc.

Large.—Experience an awe of God and things sacred; love to adore the Supreme Being, especially in His works; feel true devotion, fervent piety, and love of divine things; take great delight in religious exercises; have much respect for superiority.

Small.—Experience little devotion or respect, and are deficient in fervor; care little for religious observances, and are not easily impressed with the worshiping sentiment.

Vitativeness.

Qualities: Tenacity of life; resistance of death; love of existence; dread of annihilation; love of life, and clinging tenaciously to it for its own sake.

Large.—Will struggle resolutely through fits of sickness, and will not give up to die till absolutely compelled to do so.

Small.—Like to live, yet care very little about existence for their own sake.

Weight.

Qualities: Intuitive perception and application of the laws of gravity, motion, etc. Adapted to man's requisi-

tion for keeping his balance. Perverted, it runs imminent risks of falling by venturing too far.

Large.—Have an excellent faculty for preserving and regaining balance, riding a fractious horse, skating, carrying a steady hand, etc.; easily keep from falling when aloft, or in dangerous places; are pained at seeing things out of plumb; judge of perpendiculars very exactly, and can safely walk on the edge of a precipice, etc.

Small.—Are quite liable to sea-sickness, dizziness when aloft, etc.; never feel safe while climbing, and fall easily.

EFFICIENCY.

1. Having the required knowledge or skill.
2. The power of producing results.
3. Keeping everlastingly at it—the only sure road to success.

OPPORTUNITY.

The man who will work for the satisfaction of work well done—for the joy of achievement—for him there are large opportunities.

FAITH

In order to be successful, a man must have faith in his ability to do what he undertakes, and in the thing to be accomplished.

THE NEW SALESMANSHIP

PREPARATORY

Personality in salesmanship is that force of mind which inspires belief.—

Salesmanship is the science and art of influencing the mind through the five senses. The number of senses that can be played upon depends on the line or article to be sold.

A wine merchant or salesman can play upon all five senses. The sense of Sight is played upon by the merchant's or salesman's manner, expression, gestures, and the color of the wine. The sense of Smell by the bouquet and flavor of the wine. The sense of Taste by the sweet or sour taste of the wine. The sense of Feeling by the generous warmth imparted by the wine to the Feeling. The sense of Hearing by the salesman's voice and argument.

The dry goods salesman can only play upon three of the senses. The Sight by himself and his samples. The Feeling or Touch by letting the buyer handle his samples, and Hearing by his voice and argument. The salesman selling from a catalogue, or who is selling anything of which no sample is shown, can only play upon Sight and Hearing, but to the expert this is enough.

Operating upon the sense of Hearing is by far the most important, for through the Hearing a salesman can persuade the mind that the other senses are mistaken in their perceptions, or that the consensus of opinion favors the direct opposite of what the mind conceives.

The style of argument and the kind of reasoning to be used must be determined by the proposition the salesman is selling, and by the character of the buyer. This will be shown when the different types of buyers, and the building of the sales argument is taken up. Continuing with the Hearing we still have the voice, and the pitch and tone of the voice used is often half the battle.

The voice can be trained to become so strong and forceful that its very force carries conviction to the mind of the hearer.

It can be trained to become so even, and matter-of-fact, that its very tone suggests truth, and the mind of the hearer unconsciously adopts the suggestion that the proposition is entirely as represented.

The voice can be trained to become so subtly soft and low that it deadens the resistance of the brain like a soothing narcotic.

I will give illustrations of the different voices, taken from my own experience, but it is first necessary to explain to the reader what the mind is and part of its workings.

The three regions of mind are Emotion, Intellect and Volition.

Emotion is any agitation of mind, or excitement of sensibility. It is what is commonly called the feelings.

Intellect is that region of the mind that receives and comprehends the ideas communicated to it by the senses. It is the region of the mind that understands and thinks.

Volition is the Will.

The emotions are the natural impulses of the mind. The intellect acts as a guard upon the emotions. If the salesman wishes to play upon the emotions he must first penetrate the intellect.

Any experienced buyer knows that to allow the emotion of interest to become intense soon leads to the emotion of desire, which unduly influences his judgment, and he guards against it as much as possible. A sale may be made by dealing with the intellect and will only, or it may be made by dealing with the intellect, emotion, and will.

When the intellect and will have been dealt with the different stages that the mind passes through for the accomplishment of the sale are these: Attention, sustained attention, approbation of judgment, consent of the will.

When emotion has been dealt with the stages are these: Attention, interest, desire, approbation of judgment, or disapprobation of judgment yielding to desire, consent of the will.

Attention is of two kinds—Spontaneous, or natural, which arises from the emotions; and Voluntary, or artificial, which requires an effort of the will. The difference between sustained attention and interest is that sustained attention must be intensified to become interest, which is an emotion.

Desire is an emotion and has no place in the sale made

through the intellect only, for the buyer that is ruled by the intellect says to himself, "I can use it," while the buyer that lets emotion rule him says to himself, "I want it."

To illustrate: The salesman, by a proper approach, has gained the attention of the buyer ruled by intellect. By his argument, and the proper pitch of voice and tone, he sustains attention. By the sound logic of his reasoning he convinces the buyer and gains approbation of judgment. This is where the buyer says, "I can use it," and if there has been no antagonizing influence consent of the will is voluntary.

But in the case of the buyer ruled by emotion the process of mind is different. The salesman, after gaining the buyer's attention, sees that he has an emotional character to deal with, proceeds to intensify attention into interest, turns interest into desire, and if approbation of judgment is gained, consent of the will is spontaneous. But if disapprobation of judgment follows desire (too expensive, etc.) the salesman again plays upon desire so strongly that disapprobation of judgment yields to desire and consent of the will is voluntary.

Where disapprobation of judgment occurs in the transaction with the buyer ruled by intellect the salesman must effect the sale by convincing the buyer that he has made an error of judgment.

It is of the utmost importance that the salesman should be able to discriminate between the two kinds of buyers, for if he makes a persistent attempt to play upon the emotions of the buyer ruled by intellect, this buyer

is likely to abruptly close the interview and refuse to entertain the proposition any longer. In the case of the buyer ruled by emotion, if the salesman does not understand his man, his mode of operation is often times too mild and no impression is made, or too strong at the start and he never gets beyond attention.

Where intellect holds sway, but the emotions can be reached, the salesman deals with intellect until he can slip in his opening wedge and then plays upon emotion.

How the buyer is read, how he is handled, the styles of argument to be used, and the voice to employ will all be taken up in their proper place and treated of thoroughly.

Now that the reader knows what mind is and part of its workings, I will proceed with the sense of Hearing and show the effect of the voice on the mind by illustration. One time in the month of January I was out selling goods for March delivery. I called upon a merchant who agreed to look over my goods. As we went over the line the numbers that the merchant liked were laid aside but not purchased.

Before we had proceeded very far I knew my man, for his free manner of selection, and his favorable comments on the goods were in direct opposition to his character. The end I foresaw would be a put-off.

After we had gone through the line the merchant pulled a pencil and memorandum book from his pocket and said, "I will take down the numbers I have selected and order later."

This I was prepared for, and augmenting an anger

that I felt in some degree into a very torrent of passion, I pushed the goods aside and turned abruptly upon the merchant with every fibre of my body quivering with intensity, and in a voice fairly ringing with passion I shouted, "No, sir! You cannot have those numbers. That is not the way I do business, for I cannot keep my employer's factory running by giving out numbers. You are merchant enough to know your own mind—your every appearance indicates it. You know that my goods are right, and that my prices are right—you have voluntarily said so several times."

I got no farther. The merchant started for the samples and I saw that I had conquered; but pretending I thought that he still wanted the numbers, I pushed him back in order to increase his desire, and make him fight for what he did not want before.

"What's the matter—what's the matter? I'll buy 'em—I'll buy 'em!" he cried.

"Very well," I replied, and proceeded to take his order. And I will add that I took many more orders from him after that.

The reason I used such a strong voice was that I saw the buyer was endowed with large cautiousness. The fact that he had gone over my line praising it as we went along, and then wanted to put me off, confirmed this. I also saw that the faculties that would resent such a voice were innocuous. Over-cautiousness is always attended by hesitation and indecision, and when played upon by fear the mind is instantly thrown into a panic, when unrestrained by the other faculties, and immediately mani-

fests itself by a desire to propitiate. I therefore operated with the idea that he would not get my goods unless he purchased them at once, first sensitizing his mind by throwing it into surprise, by my manner, expression, gestures, and voice, so that the idea would sink deeply, and have its full effect. The end justified my course of procedure. The reader will also see a little flattery in my argument to the buyer, which, when delivered in the voice and manner I used is always effective when the emotions have been touched.

By explaining at this stage why I used this voice and manner is encroaching upon another part of the work, but it is necessary, for some readers may think that I risked a punch on the eye, which no verbal argument would have overcome.

The next illustration will be of the even and matter-of-fact voice.

At one time I was engaged in marketing an expanding syringe. The instrument was scientific in its construction, simple in its workings, and artistic in appearance, but rather suggestive.

After handling the instrument a time I conceived the idea of putting it on demonstration and suggested this to the inventor and owner, who met the idea with enthusiasm.

I presented my proposition to the buyer for one of the largest department stores in Chicago, who, after considering it, was impressed and requested me to see the merchandise manager, whose consent must first be gained.

Going to the merchandise manager's office I went over the proposition with him, first telling him that I had already gone over it with the buyer, who thought very favorably of it.

I then explained and demonstrated the instrument thoroughly and when through handed it to him for a closer inspection. After handling, working, and considering the instrument for a few minutes he turned to me and said, "It's a rather suggestive thing to demonstrate, isn't it?" This I was prepared for and replied in a most even and matter-of-fact voice, "No; a thing is only as you assume it to be. If there is that in the demonstrator's manner or voice that implies that it is suggestive it is accepted as such; otherwise it is accepted in the spirit intended. On that score you need have no fear, for we will furnish a very clever lady demonstrator, who not only knows the instrument thoroughly, but who knows human nature as well, and who, by her tact and skill in handling the women with whom she comes in contact, will make a large number of sales and lay the foundation for a future money-maker for the department. When you consider the instrument from a hygienic standpoint you will see that it is really a necessity and should be in every home. False modesty should not be allowed to stand in its way."

He thought a few moments, then finally said, "Well, I think it will be all right. You can tell Mr. Blank that I say he can go ahead."

And so permission for the demonstration was secured. But had there been any excitement or undue emphasis in

my voice the battle would have been lost, for he was a man who thinks—not feels.

Next we have the low voice.

One day I entered the sample room of the house where I was employed as a salesman and found one of the proprietors engaged in an attempt to sell one of my customers some goods.

I shook hands with the customer, and after a few pleasant words, drew back a little, signifying that I did not wish to interfere.

They started again from where they had left off and were soon in a hammer and tongs argument, the proprietor affirming that the goods and prices were right, and the customer denying it. I let them go on until they were worked up to a white heat of excitement, then I took a hand. Leaning slowly but deliberately between them I picked up one of the samples and laid it before the customer. Keeping my eyes fixed intently upon the sample, I stroked it a few times in a caressing manner and said in a low, soothing voice, "John, there is a number that you shquld not pass up."

One who does not understand the mind and its workings cannot imagine the effect my action produced. The proprietor's jaw dropped, and he sat staring at me in open-mouthed amazement, his eyes nearly popping from his head.

The buyer gave one uneasy movement in his chair, then sat perfectly still with his eyes riveted on the sample in a fascinated gaze.

My unexpected interference, and the sudden transition

from a loud and antagonizing voice to one that was softly low and soothing, so shocked his mind with surprise that he was utterly incapable of thought. His mind was so highly sensitized that my suggestion sank into his brain like a ten-penny nail hit by a pile-driver.

Continuing in the same voice I said, "From what I know of your trade I am sure that it will be one of your best selling numbers of the season. We will lay it aside, shall we?"

The buyer nodded. He was still incapable of speech. And so I went on, in the same voice, selecting such numbers that I knew he could use, and suggesting that he should take them, and meeting with his acquiescence each time until the order was booked.

In justice to myself I must say that I did not overload the buyer.

The reader will be surprised to learn that the art practiced upon this man was hypnotism, although I did not know it at the time.

Many may say that it was unscrupulous to take advantage of the buyer when I saw that he was influenced, but in justification I will say that there is not an honest business man today that can deny that he has at some time or other lowered his voice when in the heat of an argument and he saw that the battle was going against him. His object was to influence the other man.

So was mine, only that my method of operation was stronger. And in further justification I will ask, "What is value?" Many of our richest men could answer, "Value is the least you can give for the most you can

get." I will simply say that value is a matter of opinion. And it is the business of the salesman to influence opinion. That is what he is paid for.

The prices of goods are marked according to what is paid for them, and according to what they will bring.

I am not digressing, but have simply led up to the subject of hypnotism for the purpose of showing that it is necessary to know what it is when dealing with the five senses.

We all know of the young salesman who starts out on his first trip and makes a wonderful success, but when he makes his next trip falls down most miserably. This is due to the fact that he had so influenced his buyers by the intensity of his faith, that was founded on ignorance, and by his unbounded enthusiasm, that the buyers heard, saw, and felt only as the salesman did. The salesman, not knowing that he had the buyer so strongly influenced, naturally wished to sell as much goods as he could and suggested that the buyer should purchase everything that the salesman liked. The result was that the buyer was overloaded, the salesman's chances for future business killed, and a customer lost to the house that the salesman represented.

I will now tell you what hypnotism is so that you can guard against this.

Hypnotism is nothing more than the power of an idea, whether it is caused by the operator holding up a small or glittering object and telling the subject to concentrate all his attention upon the object and think of nothing but sleep; whether it is caused by the operator looking his

subject in the eyes and making passes with his hands, or whether the mind is subjected to positive sense delusions while in a waking state. That is the mind thinks it sees something, but is mistaken in its perceptions. When the operator makes passes with his hands in putting the subject to sleep the passes are auxiliary only in this way—they suggest to the subject that the operator is throwing a hypnotic or magnetizing fluid into his mind that will force him to succumb. If the subject attempts to stem the force of the idea by exercising his will he only succumbs the more readily, for it increases his self-attention and he realizes his impotence, which immediately demoralizes his power of resistance and he succumbs accordingly. It is not a matter of will with the subject, it is a matter of knowledge. In order to keep from being hypnotized he must keep his mind off the idea.

With the operator it is a matter of will and a knowledge of the workings of the mind when influenced by suggestion, or in its true sense, by the power of an idea. Hypnotization is produced by strong and sudden excitement of the senses, by fixing the attention upon an idea or object, by limiting the involuntary movements of the subject so as to keep his blood quiet, and by limiting the field of consciousness so that only one sense is in action and the others are all unconscious. They all tend to produce inhibition which will be taken up in the next chapter.

I will now illustrate how the senses are deluded. We will suppose that an ignorant or rascally salesman is selling cloth made of cotton, but which resembles wool. The salesman approaches a merchant, who gives him at-

tention. The salesman commences his selling talk to the effect that his goods are wool, avoids antagonism and keeps the blood of the merchant quiet. The merchant has a belief that the goods are cotton, but continues to listen to the salesman who talks so positively and convincingly that the buyer's senses of Sight and Touch succumb to the sense of Hearing, and he believes that the goods are wool. He is then under the influence of a sense delusion.

Then again we have the other side of the case. A buyer's Hearing may be defective. His sense of Sight may be impaired. He may be afflicted with color blindness, or he may not observe closely. His senses of Taste and Smell may be impaired so that he cannot distinguish differences in odors or tastes, and his sense of Touch may have become blunted so that he cannot detect slight differences of feeling.

When such is the case and a buyer forms a wrong opinion of a thing he is then deluded by his senses, and a salesman suffers accordingly unless he reverses the opinion by inhibition.

More will be said of the senses farther on, but we will first see how the blood is controlled.

THE PHYSIOLOGICAL EFFECT OF THE POWER OF AN IDEA.

We have now seen that the Emotion, Intellect, and Will are influenced through the five senses by the powers of an idea.

But the power of the idea may be affected by the state of mind or mood that the buyer is in.

The skillful salesman knows this, and he therefore prepares, or sensitizes the mind for the proper reception of the idea.

This he does by playing upon the nervous system and the heart beat, or circulation of the blood, which is governed by the nervous system. That is he uses an idea that will create an emotion, or thought, and change the trend of existing thought.

The quantity of blood that is circulating in the brain, which is the organ of mind, determines its capability or capacity of receiving or comprehending an idea. A brain that has been stirred to rage fills with blood and restrains heart action: it is almost impossible to reason with it until the blood has subsided.

But when the brain has been acted upon by strong surprise the effect is just the opposite—the blood leaves the

brain, the existing ideas vanish, and the mind being practically blank is open to another idea, which on this account impresses itself on the mind with powerful force. When the mind is practically blank it is highly sensitized. We therefore see that there are emotions which augment or accelerate the action of the heart, and consequently increases the circulation of the blood, and also emotions that check or inhibit the action of the heart, which decreases or stops the circulation.

Following is a classification of the thoughts and feelings that accelerate or inhibit the action of the heart, acting either mildly or strongly.

Accelerating.

All of the following quicken the action of the heart:

Rage.	Disdain.	Love.
Anger.	Contempt.	Tender Feeling.
Determination.	Disgust.	Devotion.
Indignation.	Avarice.	Ambition.
Obstinacy.	Pride.	Flattery.
Ill-Temper.	Vanity.	Shame.
Affirmation.	Interest.	Admiration.
Negation.	Desire.	Rapture.
Sneering.	Joy.	Passion.
Defiance.	High Spirits.	Rapid Thought.

Sympathy is both accelerating and restraining.

Excitement is accelerating, but when opposed to excitement it restrains or checks.

Inhibiting.

All the following check the action of the heart:

Surprise.	Astonishment.	Wonder.
Arrested Attention.	Impotence.	Moroseness.
Fear.	Anxiety.	Reflection.
Horror.	Grief.	Meditation.
Patience.	Dejection.	Propitiation.
Guilt.	Low Spirits.	Sulkiness.

The following will illustrate how the ideas work:

We will suppose that a salesman has said something that causes the buyer to become angry. The ideas expressed by the salesman enter the buyer's ears and are carried by their nerves to the brain. They cause thoughts, and the impressions are perceived by the spinal cord, which passes the impression on to the sympathetic nervous system. The impression causes the nerves to become limp and their control over the blood vessels is gone; the blood gathers in the vessels and rushes to the brain. Now this condition can be sustained by repeated stimulation; that is, the salesman continues to anger the buyer. By repeated stimulation of the accelerating nerves a fairly vigorous heart, especially one without much blood, may be reduced to a very feeble condition; that is, the action of the heart becomes exhausted and is no longer capable of pumping the blood to the brain. This condition is known among salesmen as tiring out a buyer, but is the worst way of selling goods that there is for the buyer

knows that he has been forced into buying, and will avoid the salesman thereafter. The proper way to handle anger is to use an inhibiting idea. This idea affects the Vagus nerves and these nerves put a brake on the heart, and the blood flows back to the heart again.

If the inhibiting idea is Propitiation the brake is applied gently and the blood gradually subsides. But if the inhibiting idea is sudden and strong Surprise the effect is instantaneous. The brake is applied so strongly that the blood rushes from the brain back to the heart.

If a salesman has used a low voice when presenting the inhibiting idea he can sustain the inhibition by quickly following up the idea with the other strong ideas in the same low voice. This is called rhythmical stimulation.

But if the salesman has used a strong voice he must follow up his idea with other ideas in the same strong voice until he sees that the buyer is yielding.

Anger, however, should be avoided.

The proper way to control the blood when making a sale is this: create attention, which is a slight inhibition, by stating something that will cause a slight surprise or wonder, or state something that will cause reflection. This will produce a mild inhibition. The next statement you make should be interesting and suggestive. This will release the inhibition, and the action of the heart is accelerated. Interest is then established and the blood is aroused in the salesman's favor.

When interest is aroused it is only necessary to keep the blood going in the salesman's direction by properly

guiding the mind. How this is done will be shown when the building of the sales argument is taken up. Remember this: that the more vigorous the action of the heart, the more rapidly it is beating, the easier it is to bring about inhibition.

The more slowly or weakly the heart is beating, the more readily it responds to acceleration. Either condition can be sustained by rhythmical stimulation, but when the stimulation ceases the action of the heart is reversed.

The professional hypnotist uses inhibition to put his subject to sleep. The fool salesman uses inhibition to overload his buyer, for the blood is kept away from his brain and he is unable to protect himself. The true salesman uses inhibition simply to create attention.

Inhibition and acceleration are used by every salesman in the world. Those who do not know how the blood is controlled use them unknowingly. Those who do know how the blood is controlled use them scientifically.

When determining the kind of idea to be used the salesman is guided by the state of mind or mood that the buyer is in, and by his knowledge of the faculties of the brain, their peculiarities and workings. The location of these faculties is shown in the chart at the front of the book; further on is shown how the different faculties work and how they are influenced, and in the Appendix the faculties are analyzed and explained.

The expression of the face will tell a salesman whether a buyer is emotional or intellectual. The expressions most common to the emotional are these:

Emotional.

Mild—Sympathetic, kind, some yielding.

Medium—Equable, but not deeply so.

Sensitive—Animated, impulsive, mobile, excitable, irritable, irascible.

Blasé—Surfeited, worldly-wise.

Intellectual.

Where the intellect strongly predominates it is characterized by quiet and deliberate thought, speech, and actions. It rarely acts on impulse. The face is calm and expressive of deep thought.

Where an intellectual buyer possesses great nervous energy there is a constant conflict between emotion and intellect and while the intellect prevails in most cases it sometimes yields to emotion. The expression of the face is strong, determined, and marked by repression. Do not form the opinion however that the intellectual is never influenced by his emotions, for he often is. But the ordinary business proposition is not of a nature that will allow the employment of ideas which will arouse anything much stronger than inclination in this type.

When inclination is gained it is only necessary to properly guide the mind to effect the sale. This will be shown in the building of the sales argument. In handling the emotional, the mild requires a low voice, mild stimulation.

The medium requires an even matter-of-fact voice until his equability changes. If it changes in your direction

slightly raise your voice to give emphasis. If it turns against you drop your voice in an explaining tone.

The sensitive requires either low or strong voice, according to conditions. If mild stimulation proves ineffectual suddenly change to the strong and continue until they yield, then gradually drop lower.

The blasé require rather strong stimulation, for their nervous susceptibility has become somewhat blunted. The intellectual requires an even, matter-of-fact voice, slight emphasis if any.

The intellectual of strong nervous energy requires an even, matter-of-fact voice. If he interrupts let him finish, then proceed in the same voice, with a strong argument, raising a trifle in your voice as you go along. The degree of femininity in a man is an extremely good guide in determining his nervous susceptibility. The more femininity in a man the greater his nervous susceptibility.

Individuals possessing fine hair, thin skin and large, round, wide-open eyes are sensitive.

We will now consider the forty-two faculties of the brain. These faculties are analyzed and explained in the Appendix. When the salesman has studied these he will possess an insight into human nature that he never deemed possible. The senses of Sight and Hearing affect all of the faculties.

The sense of Touch affects all of the faculties except Color. A blind man has the use of all of his faculties but Color, and is guided by his sense of Touch. You would hardly think that a deaf and dumb salesman could sell to a blind man, but he can by guiding the blind man's

fingers over his alphabet. The senses of Taste and Smell primarily affect the faculties of Alimentiveness, Acquisitiveness, Cautiousness, and Combativeness.

If the reader will remember, it was stated farther back that when the action of the heart is strongly inhibited by surprise the blood rushes from the brain back to the heart.

But all of the blood does not leave the vaso moter center of the brain, for then unconsciousness would ensue, as in the case of a woman who faints from some strong and sudden emotion. Instead, there is some blood retained in the brain and it is directed to the faculty or faculties affected by the idea used by the salesman.

To illustrate:

I enter the store of a merchant whom I have never seen before. As I approach the merchant his faculty of Human Nature or Individuality forms an opinion of me. The opinion is rather inclined to be against me and his faculty of combativeness is slightly aroused. I see this from the expression of his face. I also see that he has rather large Cautiousness, and that his Combativeness and Destructiveness are not very strong.

When introducing myself I do so in a manner intended to propitiate him. But he is not to be propitiated, so I see that I must draw the blood away from Combativeness by surprise. I continue however to be propitiating but am gradually working up a passion, which I hide. At last I appear to see that he is most unreasonable and suddenly straightening up my body with a sudden jerk, throwing the intensity of my feeling into my expression and voice,

I shout at him strongly and positively to the effect that my proposition is of a nature to demand attention. He gives a start, and his eyes open wide at the unexpected attack. Cautiousness is aroused and is given the blood necessary for it, but the action of his heart is inhibited and the blood flies from Combativeness and his other faculties back to the heart, and his brain is sensitized. I instantaneously follow up my attack and tell why my proposition demands attention and the blood is directed to Causality and Comparison. I waste only a moment here, but direct the blood to the faculties that my proposition affects. Say that they are Form, Size, Color, Weight, and Constructiveness. I dwell on each faculty clearly and positively, and lead from one to the other until I have analyzed my proposition. Never by a word or look have I created a suggestion that will divert the course of his blood from the direction I am guiding it in. When through with the details of my proposition I direct the blood to Acquisitiveness, and suggest so strongly that the merchant should have my proposition that when I am through talking the first words he utters are, "How soon can I get it?" Making a sale is a game like chess or checkers. Each game has its rules. It has its openings and their variations. It has its positions where a skilled or scientific player can force a win. It has its endings which result in a win, loss, or draw.

A scientific player who has resolved to win and not experiment will select an opening in which he is thoroughly versed, and any move that his opponent makes he is prepared for. He guides the game into the strongest

variation of the opening, and every move that his opponent makes can only be a defense, for the variation will allow of no attack from his side. There is an opening in the game of checkers called "The Old Fourteenth." In this opening is a variation that leads up to a move for the black side that looks to be the strongest move on the board. If the black side makes this move its game is utterly demoralized, for it allows white to play what is known among book players as the "big shot," which wins with ease. So it is in salesmanship. A salesman can lead up to a point where he causes the buyer to make an assertion that he is prepared to overcome most convincingly, and the buyer's game is lost. A salesman is like a player who has discovered a new variation and is showing it to another player. As he makes each move he explains or analyzes why this move is made. He has so thoroughly analyzed the variation that he cannot be contradicted, or if he is, he is prepared to show that he is right. When he has played the game to its end he has convinced the other player that the variation is a win. And so it is in salesmanship; the salesman convinces his buyers that what he is selling is a money-winner. The buyer's brain is the board upon which the game is played. The faculties of the brain are the men. The salesman moves or guides the blood to these faculties as he would chess-men or checkers on a board. It all lies in your selling argument, and you will see how to build your selling argument farther on. We now see that in dealing with a buyer we are dealing with the faculties of the brain. The predominance of some of these faculties tends to produce

peculiarities and idiosyncrasies, which result in types and characters. In this chapter it has been the purpose to reduce psychology to a working basis; that is, reduce it as much as possible to material form, so that the salesman will cease to regard mind in the abstract and consider it in a concrete and tangible form that will enable him to deliberately plan his mode of attack in a truly scientific manner. Farther on in the book is given an elaboration of the subject discussed in this chapter.

Regarding the matter treated here, as well as in following chapters, it should be said that after the salesman has digested and assimilated the ideas set forth he will seldom have to recur to them in the process of making a sale, for they will have become a part of himself, and he will unconsciously, or instinctively, use them at the right time. Were this not so, the book would be of little value to him, for it would be almost impossible to think of a book while trying to make a sale.

It has often been said that when a salesman has sized up his man correctly his sale is practically assured. But this is only partly so, for while the salesman may know the kind of man he is dealing with, he may not know how to handle him. This will all be explained farther on.

These types and characters, and the way to handle them, will be taken up later, but we will first take up the twenty weapons of attack that a salesman has at his command, beginning on the opposite page.

THE TWENTY WEAPONS OF ATTACK.

These are as follows:

Knowledge.	Interest.	Inducing Forgetfulness.
Suggestion.	Enthusiasm.	
Voice.	Desire.	Wonder.
Manner.	Sympathy.	Surprise.
Expression.	Self-Attention.	Imitation.
Gestures.	Persuasion.	Fear.
Excitement.	Propitiation.	Persistence.

KNOWLEDGE.

This weapon gives a salesman the ability to size up a buyer and conditions. It gives him the ability to handle a buyer by knowing the mind and its workings. It is the result of Intuition, Observation, Study, and Memory. It gives self-control because it knows the mind and its workings, and is not easily diverted or surprised from its course. It gives self-confidence because it knows itself and its ability, and its superiority over untrained minds. It gives practicalness because of its ability to size up men and conditions.

But knowledge must be systematized so that it is ready

for instant use, and must not depend upon inspiration for its efficiency. Then knowledge is power.

Suggestion.

A suggestion is any idea, image, or object, in fact anything, that presents itself to the mind through the five senses and causes thought, emotion, action, or all three. An auto-suggestion is an idea that arises within the mind itself and is caused by a recurrence of memory, prompted by suggestion. Suggestion is a simple thing, yet so extremely subtle that none can tell definitely to where it may lead. A suggestion will work either for or against a salesman when he uses it, and it requires a knowledge of conditions and men to determine how to use a suggestion. To illustrate: A certain article in the line that a salesman is handling is becoming scarce and the price is likely to advance. In such a case a salesman should protect his customers. All buyers expect this, but many do not appreciate it until it is too late.

The salesman calls upon one of his customers who is endowed with large Firmness, Self-Esteem, and Combativeness. Upon entering the store the salesman sees that the customer is nearly sold out of the article. After a little preliminary talk with the customer he brings up the subject and says: "I see that you are nearly sold out of (here he names the article). I am glad that I noticed it for the stuff is selling so rapidly that it is becoming scarce. I received a letter from the house telling me not to push the article, and to confine it to our regular customers, for there is likely to be an advance in price. If

you will allow me, I would like to suggest that as the article is a seller with you it will be good policy to double up on the quantity this time, or if you think you can use it, take even more."

Now this is a customer who cannot be driven, but has to be led. The suggestion will therefore act favorably for the salesman, and the chances are that the customer will order at least double the quantity of his original order. But if a customer is weak-kneed and timid he has almost to be driven to do things that are for his own good. The suggestion just used is not strong enough for him. It would only elicit the reply that the same quantity he had before would be enough, and that he did not like to carry too much stock.

You leave off the sugar coating on his pill and let him taste a little of the bitterness, in a manner something like this: "I see that the last lot of (here he names the article) is nearly all gone. You had better prepare yourself, for the house writes me that the stuff is getting scarce and that the price is likely to advance."

"Do you think so?" asks the customer.

"I know it. Everybody is laying in as much as they can handle, and it won't be long before the market will be clear of it. Then you can't get it for love nor money."

"Well, I think I had better take a little more this time," answers the customer.

Every word and every act uttered or committed by a salesman has a favorable or unfavorable effect upon a buyer's mind, and unless the salesman is proceeding systematically and with judgment he is very apt to do or say

something that will be detrimental to him. Suggestion lies in the salesman's conduct as well as in the selling argument.

A salesman may be too suave and oily, and may grease his buyer so that he slips through his fingers. The suggestion is that the salesman is too smooth. A salesman may be timid and his manner will suggest a lack of merit in his goods, or he would have more self-confidence.

Again, the salesman may be too aggressive, and the suggestion may be that it is aggressiveness and not merit that is selling an article, and aggressiveness in many cases will suggest combativeness and an attack upon self-esteem.

Again, aggressiveness may suggest merit in an article or proposition because of the extreme confidence suggested by aggressiveness.

It is merely a matter of knowing the type of buyer you are dealing with, which will soon be taken up. A mere hint, intimation, or insinuation, suggests influence, coercion, or maliciousness, as well as the idea it embodies. They must be well veiled when used.

There are two kinds of suggestion—direct and indirect.

Direct suggestion is a direct statement, or act of reasoning, presented to one or more of the faculties of the brain and contains an obvious meaning or truth.

Indirect suggestion is the presentation of an idea, or ideas, to one or more of the faculties with the intention of influencing another faculty by implication, intimation, hint, insinuation, or innuendo.

Either of the two kinds of suggestion will cause an

idea or chain of ideas that will produce an act of the will.

As you go along through the book you will find many forms of suggestion, especially in the figures of speech. In the analysis of the sales argument you will find the secret of the power of an indirect suggestion.

Before using a suggestion ask yourself these questions. What does he know about what I am going to say, or show him? How will it affect him, or how will he feel about it? How shall I present my ideas?

When using suggestion always consider how it will affect the faculties of Self-Esteem, Approbativeness, Conscientiousness and Cautiousness. If you do not attack any of these three faculties you will not arouse Combativeness, and with Combativeness quiet there will be no antagonism.

The Voice.

The three winning voices are the strong and incisive, the even and matter-of-fact, and the mild but positive. They all suggest confidence and a thorough knowledge of the proposition in hand. This confidence is contagious. The tone may be positive, sincere, ingratiating, hinting, insinuating, interrogative, propitiating, doubtful, and indifferent. The last three should only be used in propitiatory circumstances.

In most cases the voice should be firmly positive, whether strong or mild. But all depends upon the type of the buyer. On the voice mostly depends the ability to inhibit or accelerate the action of the heart, and its consequent action on the brain, and the sustaining or moderating of the effect produced.

The Manner.

When approaching a buyer the salesman's manner generally determines whether he will receive spontaneous or voluntary attention. If spontaneous the buyer will be in sympathy with the salesman. If voluntary he will be rather indifferent, or mildly or strongly combative toward the salesman.

When combative he must be propitiated or surprised in order to draw his attention from the restraining factor. Strong combativeness toward a salesman is often an aid to him, for the action of the heart is accelerated and is easily inhibited by surprise.

When using strong inhibition a sudden straightening of the body increases the effect.

To sustain very strong inhibition the salesman's entire body should tremble and shake with emotion. When you have a buyer in this condition plant your strongest idea at once in your most positive manner and voice. Do not allow yourself to relapse into a quieter manner before planting the idea, for the brake on the heart will be released, the blood will rush to the brain, and your idea will meet with opposition.

When a buyer is seated a slight inclination and stillness of the body is best, for it does not distract attention.

Expression.

The expression must always change with the voice and the thoughts or feelings that the voice expresses. It should express a language as eloquent as the voice.

It may be positive, persuasive, interrogative, ingratiating, conciliatory, enthusiastic, and in fact it may display every emotion that is felt by man. Be careful of the use of the interrogative expression for it suggests to some buyers that you are trying to read their mind, and they will be on guard. The eyes are the most important in creating expression, for the eyes are the windows of the soul, and the soul speaks a language that all can read.

Gestures.

Gestures suggest and express feeling, and greatly help to enforce an argument or opinion. They must be suited to the subject and be in perfect harmony with the voice, manner, and expression. Never swing your arms wildly outward, for it suggests that you are talking to the whole world, and scatters attention. Short, sharp jerks of the fore-arm directly in front of the body concentrates attention and adds intensity. Some salesmen use a gentle, wavy motion of the hands to add effect to a pleasing idea, but personally I have found it best to depend upon the strength of the idea, the voice, and expression.

Excitement.

This weapon should be used to overcome indifference and lead up to interest and enthusiasm; or to inhibit excitement that is directed against you.

If you have noticed you will remember that when a person has become excited at you, and you become excited in turn, his excitement will calm down unless he is of a fighting disposition. Do not become excited with such.

Sudden excitement directed at a calm mind that is indifferent toward you is a farce. Avoid it. Begin gently and work up by degrees.

Interest.

When a buyer has become interested in a proposition he has given the salesman a hold upon him that cannot be shaken off, if the salesman keeps his blood properly directed. It all lies in the selling argument.

Enthusiasm.

This is a great weapon of suggestion, for enthusiasm is contagious after the action of the heart has been accelerated.

The emotional buyer readily responds to strong enthusiasm, but the intellectual requires suppressed enthusiasm. Feigned enthusiasm deceives no one. You must feel it before you can arouse it in others.

Desire.

In dealing with desire a salesman is dealing with two aversions proper,, and two desires proper. The aversions act against the salesman, and the desires for him.

The first aversion is where a buyer has an impulse to avoid the proposition that the salesman is handling, and which forms a belief that the proposition will not prove successful, and will cause loss instead of gain. The second aversion is where a buyer wishes to retain what he has and does not wish to change to something else. The first desire is where a buyer longs or wishes for what he has not, and which the salesman has.

The second desire is where a buyer wishes to change from what he has for something better.

The first desire overcomes the first aversion, for the salesman has his argument ready to prove that his proposition is successful, and will create profit, not loss. He proves and demonstrates this so thoroughly that he creates a longing in the buyer's mind for what he is selling.

The second desire overcomes the second aversion, for a salesman can cause a buyer to become dissatisfied with what he has, and make him wish to change to something better. This the salesman does by showing that his goods are more attractive, are of a better quality, or of superior workmanship, and will show greater profits through increased sales or lower price.

The power to create desire lies in the proper presentation of the selling points.

All lines have some excuse for their existence; they are based upon an idea. But some lines are poor excuses; they are based on mistaken ideas.

Sympathy.

When a buyer has given spontaneous attention he is in sympathy with and has created a favorable opening for the salesman.

Sympathy will in some cases cause a buyer to purchase a thing he does not desire, or has not much use for. If a salesman wishes to take advantage of this it is better to let well enough alone and not try to impress the buyer with value or desirability, as it destroys the original intent

and will in many cases cause the loss of the sale. The buyer wishes to give, more than to buy, and finds a pleasure in doing so.

Self-Attention.

Self-attention is holding a buyer up before his own eyes with the intention of weakening his opposition to the proposition in hand. It will often descend to flattery, or resort to ridicule. It may often run on into propitiation, sympathy, persuasion, and induce forgetfulness. It is a strong weapon used against some types of the emotional.

Persuasion.

Persuasion lies in the proper presentation of a proposition, in the manner, expression, and voice. It lies in overcoming all opposition, and completely reversing a buyer's mind, or guiding it when you have a favorable start. Persuasion may be advice, coaxing, an emotional appeal, or it may be a strong current of logic that washes away all opposition and leaves the mind free from all but one idea. And this idea is that the buyer wants, or can use, the proposition the salesman is selling. This is the hypnotism of salesmanship.

Inducing Forgetfulness.

Inducing forgetfulness of an idea that is inimical to the prospects of the salesman is one way of overcoming an obstacle. This is done by sudden inhibition, or by adroitly changing the subject and gradually leading up to another variation of the proposition.

This should only be resorted to when a stronger idea cannot be used to overcome the one opposed, or when the mind is not favorable to reason.

Propitiation.

Propitiation may be used when a salesman has purposely wrought up the buyer in order to stir his blood into action. The salesman should never stir up a buyer who is obstinate or short on benevolence, for these do not forgive very easily.

Propitiation is often a very effective weapon when used to conciliate a buyer who considers himself wrongly used. I have often made a firm friend and lasting customer in this way.

Ordinarily a salesman should have his subject so well in hand, and judge the character of his buyer so well, that the trend of the sale will not run into a channel that will require propitiation.

Wonder.

Wonder creates natural attention and fixes the mind on the proposition in hand to the exclusion of everything else.

When the salesman has created wonder in the mind of the buyer he has an excellent start and, unless something antagonistic is interposed, should be able to guide the mind through the different stages that lead to the consummation of the sale.

Surprise.

Surprise is the most efficient weapon of all. When the

mind is surprised it is highly sensitized and the idea that the salesman wishes to introduce sinks into the brain with such force that, if the salesman is skillful and follows up his advantage, he has practically won his battle.

If the reader will consider the effect that surprise has had upon himself, or upon others whom he has seen surprised, he will appreciate the efficiency of this weapon far better than any description I can give.

The expression, "I was so surprised that you could have knocked me down with a feather," is an apt description of this condition.

When using surprise the salesman should quickly follow up his advantage to prevent combative ideas from arising in the mind.

Imitation.

The idea of imitation is used by the salesman to influence a buyer by what his competitors, or others, are doing. When used upon a buyer who lacks originality, and conducts his business on lines imitating others, it is a strong weapon. Yet the trend in many lines today runs toward handling different goods from that of competitors. When such is the case with a salesman's line he must make sure of his buyer before using this idea; otherwise the sale will be lost.

Ordinarily, however, example is a powerful weapon and can be used upon all classes of buyers.

Fear.

Fear can often be used as an important factor in the closing of a sale.

The fear that there will be a scarcity of an article, that the price will advance, that unless a buyer acts immediately he will be unable to get the article, that his competitors will have it, that the best numbers of a line will soon be sold, and many other arguments of a similar nature can be used.

Use them only when they are true, never as a bluff. When used as a surprise fear is most effective, and should be forcibly impressed on the mind of the buyer, but never in a manner suggestive of coercion.

Persistence.

Persistence is necessary, but must be rightly used. Many salesmen lack tact in their persistence, and make enemies instead of friends.

Other salesmen are afraid to be persistent for fear that they will make enemies.

The mode of persistence depends upon the buyer. We will now take up the different types of buyers.

HANDLING THE DIFFERENT TYPES OF BUYERS.

Many of my lady-like, timid, and ultra-conservative readers have no doubt been greatly shocked at some of the strong methods I have used.

To such readers I will say that salesmanship is everything from gentle tact to shirt-sleeve diplomacy. Not that a salesman is ever obliged to fight. He is too shrewd a judge of human nature for that. A salesman meets all kinds of buyers when on the road. Some are thorough gentlemen and must be treated as such. Others are extremely boorish, and there are few such that are influenced by dignified composure. Some boors know so little of men and the world that they consider calm dignity as a confession of weakness. A few of these may be quelled by a stern and steadfast look, but obstinacy and sullenness follow, and these are not always passed over successfully. I have found that well calculated excitement that is sincerely expressed produces better results. Nor are the rude mannered confined to the lower classes of buyers. I have in mind a certain buyer who is one of the largest of his kind. I have sold this buyer thousands of dollars' worth of goods, but have never received a

pleasant word from him. But that buyer never started an argument with me that I did not leave with an order.

Most buyers prefer to deal with equals. Some with those whom they think that they can influence. Others with those whom they consider their superiors.

A salesman ascends, descends, and finds his own level as he goes along the road.

The following types of buyers have been taken from the writer's own experience. The phrenological names of the faculties are given for their identification. The writer has sold all classes of merchants, from Marshall Feild & Co., the largest in the world, down to the smallest country merchant. His experiences have led him from the Atlantic to the Pacific. He has constantly been a close observer and student of men and motives.

Handling a buyer lies mostly in conditioning his mind for the selling argument.

The Buyer Who Loves to Argue.

The love of argument springs from Combativeness, Approbativeness and Language. If the buyer be strong on Conscientiousness and you have an argument that will overcome the one opposed, use it and the buyer's honesty will compel him to admit the force of your argument. If you lack a stronger argument on some point than the one he opposes, you have failed to prepare yourself. In this case you must bring up some point or points that you are thoroughly familiar with and cannot be contradicted upon. As you analyze the point or points the buyer's honesty will create doubt as to opposing

your proposition as a whole. When you have created doubt, press your points. Avoid argument with those deficient in Conscientiousness, for they will resort to almost any means to gain their point. Those of this class generally have rather strong Approbativeness and will always want to be right whether they are right or wrong. Argue only enough to show them that they are wrong, then give them a chance to yield gracefully by telling them that while they are right in a way there is a point that should be considered in connection. He will want to know what it is. Take up the next point and continue in a voice and manner that is devoid of contention. He sees that you know your business and will be inclined to listen.

The Disputative Buyer.

The difference between the disputative and the argumentative buyer is that the disputative is more forceful in his argument. This is because Destructiveness is added to Combativeness. The disputative will be very aggressive in his arguments.

If this buyer cannot be controlled without dispute he must be strongly inhibited. Lead him into a heated debate and when you have him all wrapped up in the subject cause him to make an assertion that you are prepared to overcome most convincingly. When he has made his assertion, pause a moment, then plant your argument in a low, soothing voice. The sudden change will utterly dumfound him because it is unexpected, and the shock of the surprise will draw the blood from Combativeness

and Destructiveness and your suggestion will strike the faculty at which you have aimed it with powerful force. Then continue in the same low voice, directing the blood from faculty to faculty, until you have finished your argument. Remember that your manner and expression must be in perfect harmony with your voice, and all three should express absolute sincerity. If you laugh when you see his sudden change of expression you will anger him and lose the sale.

The Opinionated Buyer.

The Opinionated buyer is strong on Firmness and Combativeness. He differs from the Argumentative and Disputative type in that he is honest in his opinion and clings to it for this reason and not from a desire to argue or dispute. He differs from the Inflexible buyer because he is honest in his opinion and not really stubborn. He is generally quietly firm and not disposed to argue after he has given his opinion.

When you see wherein the fallacy of his reasoning lies, do not commence your attack in a direct manner. Instead you must partly agree with him and blend your ideas with something expressed in his opinion and then work towards your point in a way that gradually enlightens him, and you will have him convinced without antagonism.

The Inflexible Buyer.

This buyer is most unreasonably stubborn and this stubbornness is caused by extremely large Combativeness,

Firmness and Self-Esteem. His face expresses stubbornness. Any attempt to persuade this buyer by reasoning with him is only a waste of time and will increase his resistance. Your only method lies in planting a suggestion that will cause him to take the initiate in investigating your proposition. Plant your suggestion tactfully and when explaining or suggesting avoid all antagonism.

The Impolite Buyer.

Impoliteness may sometimes spring from thoughtlessness or irritability, but when it is a permanent trait it is caused by weak Approbativeness and agreeableness.

In this case I have never yet seen one of the type whose Combativeness and Destructiveness would strongly resent an angry voice and manner that was quickly followed up by convincing arguments in favor of a proposition.

Do not make the mistake of getting angry and demanding respect for yourself from this type. Instead take advantage of his surprise to impress him with your proposition.

The Irritable Buyer.

Irritability springs from Approbativeness. With this faculty and Combativeness and Destructiveness strongly in the lead over his other faculties a buyer will be very susceptible of anger or passion. You must soothe this type into calmness before attempting to impress him with your proposition. When you have him calm proceed with your argument without antagonism and tactfully

explain away any reasons or opinions that he may oppose. Do not lose your self-possession and you can surely control him.

The Buyer of Choleric Temper.

This type is created by the same faculties as the Irritable, only is much stronger. The color of the face is fiery red or very dark. The expression of the face shows strong temper.

Avoid arguments with this buyer for when heated he will not listen to reason and will often resort to force. Show no fear, for some of them will take pleasure in making you afraid. Let your manner show a liking and respect for them. This will please their Approbativeness. If they have humor make them laugh. Do not attempt to gain interest for your proposition until you have drawn the blood away from Combativeness and Destructiveness.

The Aggressive Buyer.

Aggressiveness springs from the faculty of Destructiveness. In this case Secretiveness is added and Combativeness is innocuous.

The aggressive buyer is the one who tries to take the reins into his own hands and conduct an interview or an inspection of samples his own way.

To allow this is reversing the order of things, for the salesman is influenced and not the buyer. If a buyer attempts this a salesman should put a stop to it at once, and at the same time gain an advantage. This method is generally employed as a bluff to frighten salesmen into

giving lower prices or yield some other advantage. Bluffers are cowardly at bottom, and a sudden and unexpected attack catches them off their guard.

This type is generally pretty well endowed with Cautiousness, and the salesman can gain a decided advantage by quickly turning angry and by forcibly expressing his anger by voice, manner, expression, and gestures. This will surprise and shock the mind and sensitize it so that a strong suggestion planted immediately will produce good results. The suggestion to use is a positive statement in favor of the salesman's proposition, and should be quickly supplemented by other suggestions in order to keep the buyer's mind solely upon the proposition and prevent him from thinking about his wounded feelings.

When this method is due to haste on the part of the buyer, the salesman can suggest that in order to save time for the buyer he will take a short cut. The salesman has then gained attention, which he should sustain or run into interest; and the buyer will forget his hurry. The curious sometimes take this method to conceal their curiosity, but they are handled in a different way, which will be taken up later.

The "Know It All" Buyer.

This buyer has large Approbativeness and Self-Esteem. When large Combativeness, Destructiveness, and Firmness are added the buyer is extremely "know it all." Rule yourself by this buyer's Approbativeness. Create doubt in a conciliatory manner. The larger his Cautiousness, the easier it will be. Your conciliatory manner will satisfy

his Approbativeness. Then proceed with your argument in an interrogative manner; that is, by asking his opinion on every point. The flattery to his Approbativeness and the doubt you have created will influence his opinions and he will be combatively acquiescent. Continue along this line and you will gain consent of will.

The Disagreeable Buyer.

This type is created by Destructiveness, Approbativeness, Combativeness, and Comparison. It will love to criticise and boast.

When dealing with this type, quickly put a stop to his criticising and boasting by a forceful, positive, and even angry voice and manner. Then justify your attack on his Approbativeness by quickly presenting your strongest arguments in favor of your proposition. The attack must come as a surprise, which will drive away his opposition and excite interest in your proposition. Quickly press your advantage in a strong and positive manner and he will yield.

The Antipathetic Buyer.

A salesman will sometimes meet a buyer who shows a marked aversion toward him, and he experiences the same feeling toward the buyer. This is natural, for the natures are exactly opposite. The faculties that are predominant in one are weaker in the other and no sympathy exists between them.

The salesman can overcome this antipathy by throwing

himself into sympathy with the other's feelings. This will surprise the buyer and create doubt. When doubt is created press the advantage. By persistence and study of the character the salesman can win the buyer over.

The Buyer Who Is An Egoist.

Egoism springs from the faculty of Self-Esteem. This buyer considers everything only in relation to himself. All his other faculties are made subservient to his Self-Esteem.

His manner toward the salesman will be so equably self-sufficient as to be disconcerting unless you know the type.

You must lead this buyer into a discussion of your proposition. Do not attempt to do all the talking yourself. Do not use a suave or heated voice or manner. Instead use a voice and manner that is even and matter-of-fact. Talk until he shows a desire to take the initiative. He will then create an opening for you, generally by offering some objection.

Your talk up to this point should be with the distinct purpose of leading up to an objection that you can easily overcome. After you have tactfully removed the objection you have created doubt and he is not so sure of himself. Then proceed systematically with your argument.

The Buyer Who Brags.

Bragging springs from Approbativeness, Combativeness and desires approval and praise.

Listen patiently to the braggart, for that man is revealing a part of his nature to you.

Praise and approve those of large Firmness and Self-Esteem, for to show disbelief makes them sullen.

To those of small Firmness and Self-Esteem appear partly unconvinced, to pique them. After they have convinced you again you can give them your praise and take advantage of the elation that follows.

The Conservative Buyer.

The faculties that create conservatism are Acquisitiveness, Conscientiousness, Secretiveness and Cautiousness. The faculties of Vitativeness, Veneration, and Approbativeness furnish the motives. The face expresses conservatism.

A true conservative dislikes anything radical and it is therefore necessary to present a radical proposition in a manner that will blend with his conservative ideas. This blending of ideas weakens the distinct idea of opposition and creates doubt. With doubt in his favor the skillful salesman can gain interest, or sustained attention that lacks strong opposition.

To effect the blending of ideas the salesman must select the points of his argument that he knows are most closely associated with the conservative's mind and then progress systematically, step by step, constantly preparing the mind for each new idea, so that instead of seeming radical, the new ideas will seem as a natural or logical sequence to the preceding ideas.

In order to do this it is necessary that the salesman be thorough master of his proposition.

The Curious Buyer.

Curiosity springs from the faculty of Individuality and any of the faculties of Constructiveness, Causality, Approbativeness, Cautiousness, and Secretiveness. If the opposite sex is concerned it will spring from Amativeness. The curious will conceal their curiosity by indifference, exaggerated interest, or by expressing surprise and by agreeing with the salesman in all he says, but ends by saying, "I don't think I want it," or an expression to that effect.

Never show anger toward the curious, for they are expecting it, and anger should only be used to create surprise, unless you have some hold on the other. The curious already have a sense of guiltiness, and anger will not surprise them, it will only drive them away.

When a salesman sees that he is dealing with curiosity he should never allow the curiosity to become satisfied, but should concentrate upon a point that he knows the other will become interested in. This will induce forgetfulness of curiosity and develop genuine interest.

The apparent experience of the buyer and the salesman's knowledge of phrenology will enable him to determine the point of attack.

The Conceited Buyer.

Conceit is self-flattery and displays itself by extreme self-assurance. It comes from Approbativeness. Never antagonize this type. The best line of attack is to pay deference to his opinions and he will unbosom himself. When you have drawn him out, select his weak points

and attack them by tactful suggestions. This will create doubt, which advantage should be quickly pressed.

The conceited are seldom deep, for their conceit causes them to become too easily satisfied with themselves.

The Buyer That Cannot Say No.

This character's faculties of Friendship, Approbativeness, and Benevolence are in the lead over his Firmness and Self-Esteem. When pressed this character will show weak determination. His Friendship will make him yield through affection. Benevolence makes him yield to a desire to be kind. Approbativeness will make him yield through fear of displeasure or ridicule.

This buyer is easily handled through these faculties but should not be taken advantage of.

The Communicative Buyer.

This character has large Language and friendship, and rather small Secretiveness. His eyes are full if not large or bulging. His face wears a guileless expression.

This buyer will tell all he knows, even his innermost secrets, if tactfully drawn out.

Simply find out his weak points and use them against him.

The Credulous Buyer.

The credulous are weak in the faculties of Human Nature, Secretiveness, Casuality and Comparison, and strong on Spirituality, Conscientiousness and Veneration.

This type is very susceptible to plausibility and some

salesmen, who yield to the worst side of their nature, seeing that they have a sucker to deal with, hand them a package. (Excuse the expression.)

This is a short-sighted policy, even though we do not consider the right and wrong of the matter. The buyer is overloaded or buys goods that he cannot use, and a customer is lost for the house.

Yet there are some of this type who are stung time and time again by the same salesman, and each time they vow never to have any more dealings with him. But when the salesman next arrives he gives the buyer another dose of plausibility, and hands him another package.

If you are honest and sincere with this type they will give you their confidence, and it should not be betrayed.

Sometimes a buyer possessing all these faculties normal will by circumstances be reduced to necessity for a thing and is easily convinced because he wishes to be.

The Cunning Buyer.

Cunning springs from Secretiveness and is actuated by Acquisitiveness and Approbativeness.

This buyer will resort to tricks and stratagems to get the best of a salesman.

You can instantly recognize the type by their unwillingness to meet a point directly. They prefer to employ finesse. If their method takes a straightforward manner you can detect it by a searching or questioning look in their eyes.

After this type becomes interested they generally wish

to take the initiative. You can allow them to think that they are having their own way, but by tactful suggestions you should lead them along the line of your argument. As you proceed, it will gradually dawn upon his mind that he is being led, and, while he may feel a bit nettled, he will respect you, and when it comes to the question of price you can take a firm stand.

You can, if you wish, take a straightforward manner and hold them directly to the point, but this manner is displeasing to them. They love and admire finesse.

The Cold-Mannered Buyer.

A cold manner is caused by weak social faculties and weak Approbativeness, or by these faculties being held strongly in check. If the latter, it generally springs from Secretiveness and is actuated by Acquisitiveness.

This buyer is handled through the intellect and Acquisitiveness.

Present your argument in an even, matter-of-fact voice and wait for an opening. When the opening presents itself, press it, but not too eagerly.

If he is strong on some particular faculty that you can attack, do so, but not in a manner that will suggest influence.

The Buyer Who Is Concentrative.

Concentrativeness comes from the faculty of Continuity. When strong Causality and Comparison are added to Continuity it will cause a buyer to fall into a deep study of a thing that interests him.

Should a salesman suddenly stop in his argument, the buyer will go on thinking and the salesman does not know just where the buyer's mind is at.

It is therefore necessary that a salesman should have his selling argument so prepared that he can proceed systematically, and thoroughly elucidate each point as he goes along. In this way he guides the mind and knows where he is at.

The Buyer Who Likes to Compare.

A desire to compare springs from the faculty of Individuality. Although a buyer may compare things, he may not be a competent judge, for he may be weak on the faculties that are affected by the thing sold.

The salesman should know what faculties are affected by his proposition and after seeing the faculties that his buyer is weak or strong on, can act accordingly.

Buyers Who Are Changeable.

Experience must also be taken into consideration.

Changeableness comes from weak Continuity, Self-Esteem, Causality, and Firmness.

The lack of Firmness and Self-Esteem gives you the key to the mode of operation. Play upon the faculties of Friendship, Benevolence, and Approbativeness.

The Cheerful Buyer.

A lastingly cheerful disposition comes from strong Hope, Mirthfulness, Benevolence, Conscientiousness, Spirituality, Self-Esteem, and Combativeness.

These faculties strong give a character a natural and permanently cheerful disposition.

Temporary cheerfulness is different. It does not spring so much from the faculties as from the events that affect the faculties.

Present prosperity, or temporary smooth sailing, causes cheerfulness. Some late success causes a feeling of elation or satisfaction that induces cheerfulness. Future events that are auspicious for the individual cause cheerfulness.

Those of the natural and permanent disposition are not influenced by their cheerfulness, while those of the temporary are. They are tempted to take chances through the feeling of elation that induces their cheerfulness. The expression of the face tells the difference between the two. The face of the temporary shows elation or satisfaction and only partially effaces some other expression, while that of the natural or permanent shows that cheerfulness is habitual.

Use the permanent disposition as a means to a propitious beginning, but use the temporary as a means to an end.

The Deceitful Buyer.

The deceitful are weak on Conscientiousness, Veneration, Friendship, and Benevolence, and are strong on Acquisitiveness, Secretiveness and Approbativeness.

This type is extremely selfish and will use any means to deceive you in order to gain their point.

They are very undesirable customers. You can place

no confidence in them, for they will try to get the best of you at every opportunity. They will take discounts to which they are not entitled, and will return goods that they cannot sell, upon some lying pretext. They will go further if necessary to avoid loss to themselves.

Hold this type strictly to an agreement or understanding. Do not give them an inch, for they will take a yard.

Buyers Who Intend to Defraud.

This character has Acquisitiveness far stronger than Conscientiousness.

A buyer who intends to defraud, and lacks Secretiveness, will show his intentions by a guilty and hurried manner, and indifferent or loose buying.

If he has Secretiveness large he will use almost as much care as an honest man.

But if the salesman is a close observer of expression and heads he will be suspicious when he sees a tricky or unreliable expression, or a deficiency in Conscientiousness. Observe the eyes when asking for references, and if you find any tell-tale expression there, it is best to suggest care to the credit man.

If the buyer has been dealing with the house for any length of time, and stands all right with the credit man, he is likely to slip one over, unless he betrays himself by his buying.

Buyers Who Are Doubters.

Doubt springs from Cautiousness.

This buyer lacks positive qualities and is continually

doubting that he is getting the lowest price, the best terms, that the goods are right, or anything involved in the transaction.

When you see that you have a doubter to deal with and cannot control him by ordinary means, lead him up to a strong surprise. Get angry if necessary. When you have created surprise, quickly follow it up in a strong and positive voice and manner. His doubts are inhibited and his mind follows yours.

The Dignified Buyer.

True dignity comes from Self-Esteem, Approbativeness, Conscientiousness, Veneration, and Benevolence. It dislikes anything mean, underhanded, or sinful. It is honest with itself and others.

True dignity is easily distinguished from assumed dignity, for there is no exertion, it is spontaneous, and not voluntary.

This type is influenced by a quiet, open, straightforward and sincere manner. When this manner is used, attention is spontaneous. Sustained attention or interest is gained by quiet discussion. When he shows doubt or acquiescence, press your point with quiet but positive assurance.

Buyers Who Are Drinkers.

The desire to drink comes from Alimentiveness.

Drinking between buyer and salesman is far more prevalent than is supposed, although not so openly as formerly.

A drink will often warm a buyer's feelings toward a salesman, but a salesman should never make a practice of drinking, for it will affect his success in many ways, and will surely get him in the end.

Drinking makes a Mr. Hyde of a Dr. Jekyll and it also makes a Dr. Jekyll of a Mr. Hyde for the time being.

Letting drink alone and working on the better side of a buyer's nature will prove the best course in the end.

The Envious Buyer.

Envy comes from Self-Esteem and Approbativeness. Envy in a buyer will spring from mortification, or a feeling of discontent, that is caused by a salesman's success, or because the salesman possesses some superior qualities or advantages that the buyer lacks.

The salesman should never show that he sees a buyer's envy, or allow him to put the envy into action.

Instead, he should show good-will toward and an interest in the buyer. Do not speak of your success unless it is to influence the buyer to emulate the action of others.

Be sure to gain his good-will, and the fact that you are successful will have a positive influence in forming his opinion in your favor.

The Buyer Who Is Always Busy.

This is the hustler who is always in action. He is ambitious. His ambition comes from Approbativeness, Conscience, and his hustling from Destructiveness.

This type is always busy, and if you are a stranger, the chances are that you will receive but scant attention if it is left to the buyer.

Go after him. Be persistent. Attack his Combativeness if necessary. If he has large Mirthfulness, make him laugh. Touch his Cautiousness, Acquisitiveness, Combativeness, Benevolence, Conscientiousness, Approbativeness, or Imitation. Talk forcefully and rapidly. Induce forgetfulness of his work. When you have done this, proceed systematically with your argument. If you are master of yourself and your proposition, you can master him.

But be sure that your voice and manner are sincere.

The Extravagant Buyer.

This buyer has Acquisitiveness and Approbativeness in the lead over Conscientiousness, Cautiousness, and Causality. His desires are not regulated by his needs, and he is continually overbuying or buying things he has no need for.

This buyer is generally in hot water and finds it hard to meet his obligations.

If a salesman knows his man he should not be too enthusiastic, for he will find it hard to keep him from overbuying.

This is not a practical man, and his face will show it.

The Buyer Who Is Easily Influenced.

Those who are easily influenced are strong on Benevolence, Friendship, and Approbativeness. They are weak

on Firmness, Self-Esteem, Combativeness, Conscientiousness, and Continuity.

Their character is evinced by a lack of firmness in their manner, a strong desire to please, or a weakly combative attitude.

They are susceptible to sympathy, a sincere manner of good-will, and to positiveness. Use tactful persistence with this type, and once you have aroused their interest your battle is won.

The Buyer Who Is Easily Rattled.

This buyer has large Approbativeness, Cautiousness, and when Conscientiousness is added, is more easily rattled. His face and manner will show that he is excitable. If you cannot handle this buyer without excitement work him up in a manner that will cause an eager and rapid debate and when you have him worked up to the proper pitch lead him to make an assertion that you can overcome most positively and convincingly. He will then either propitiate, remain silent, or stutteringly attempt a further argument. In any case quickly press your point, for you have him going.

The Flighty Buyer.

This buyer lacks Continuity. If he is considering some proposition he will fly from one point to another without coherency. If he is looking over samples that are spread, his attention is distracted and he will wish to run around and examine the samples, and the salesman finds it hard to control him.

The salesman can control flightiness by having his selling argument arranged so that each point follows in its logical order. If the buyer interrupts, raise your hand and ask him to kindly let you finish, and tell him that you are coming to that point.

When showing a line of samples a salesman should have them in piles and not spread. This prevents distraction and forces concentration.

The Fastidious Buyer.

The fastidious buyer has large Ideality and Order. He will always have some suggestion to make relative to improving the thing you are selling.

If this buyer indicates his willingness to purchase a thing, but wants a change made, guide yourself by these three questions—"Will it pay?" "Can it be done without serious inconvenience?" "Is it practical?" If the answer is in the negative tell the buyer so, and tactfully discourage the idea by suggestions to the effect that it would be to the buyer's interest or advantage to purchase the thing as it is.

The Forgetful Buyer.

When a salesman has been "stood up" on an appointment and it is due to forgetfulness on the part of the buyer the salesman has only himself to blame. He has simply failed to properly impress the faculties that he is dealing with. Had he done so memory by association would have been established, and an auto-suggestion planted that would have recalled the appointment.

Never be satisfied with an appointment that is indifferently given.

Buyers Who Buy for Friendship's Sake.

Friendship is the goal toward which the salesman must always work. Gaining true and lasting friendship that favors you in the buying is the culminating point of salesmanship. This friendship will sacrifice many things in order to give you the business.

Friendship may spring into blossom at the first meeting, or it may require long and patient cultivation.

Use your knowledge of phrenology to promote friendship.

Buyers Who Are Old Fogies.

This type has large Continuity and Firmness.

The old fogy can be reached through his hobbies and through humoring him. Do not directly antagonize him, for he will tell you that he has been doing so and so for many years and that you cannot change him.

Instead, you must use a pleasant manner that shows good-will toward him. Draw him into a good-natured argument and let him unbosom himself. When you have found out the weak points of his opposition, change from the good-natured manner to one that is grave. Then advance your argument in a quiet voice that expresses respect for him, but that is also firmly in favor of your proposition. When you see that you have him convinced, create an opening that will allow him to appear to have found something to his advantage that will serve to justify his buying. This will please him, for he does not like

to give in. You can create the opening by asking a question that will suggest the idea to him.

The Buyer of Large Femininity.

The faculties that create the predominance of Femininity in a person are these: Parental Love, Conjugality, Benevolence, Approbativeness, Cautiousness, Comparison, Human Nature, Color, Order and Spirituality.

Femininity and masculinity are combined in all. When the Feminine is strongly in the lead a person will appear girlish or womanish.

A buyer of this type will be influenced by their likes and dislikes more than by the proposition itself.

Use an agreeable, ingratiating voice and manner with this type and you can gain their good-will. After their good-will is gained they will feel inclined to favor you.

The Strongly Masculine Buyer.

This buyer will have the masculine faculties in the lead. These are Firmness, Combativeness, Destructiveness, Self-Esteem, Causality, Constructiveness, Acquisitiveness, and Amativeness.

A salesman of the masculine type will be more apt to receive spontaneous attention from this buyer than one of the feminine type. The feminine type of salesman must preserve his coolness and show neither fear nor resentment at anything the buyer may do or say, for the buyer will expect it. Do the unexpected and remain cool and firm. This will surprise him and create respect for you.

In any event, whether you are of the feminine or masculine type, preserve your coolness with this buyer and do not become rattled. He has some weakness that you can pick out and attack. All men have some weakness.

Buyers Who Are Grafters.

The grafter's Acquisitiveness is greater than his Conscientiousness. The mode of operation employed by a hired buyer is generally to have a relative, or a close friend, get lines that he can buy. These lines are generally handled on a commission basis. When the salesman draws his commissions he divides with the buyer.

Sometimes the salesman employs some one else to sell the buyer, to avert suspicion. He may handle several lines.

Some buyers employ no go-between, but apply direct for their graft. When the graft originates with the salesman, he first forms a close intimacy with the buyer and then broaches his proposition.

Grafting is an easy way to sell goods. The grafters in higher circles set an example for those of smaller caliber.

Leaving honesty out of the question, there is this to be said against it: It spoils a man's salesmanship, and will eventually lead to trouble.

Buyers Who Like Good Times.

By a good time I do not mean ordinary entertainment. I have reference to the buyer whose good time consists

of getting drunk and associating with women of easy virtue. The salesman who makes a practice of getting business in this way generally spends all he makes, and the habits he contracts continually keep him in hot water. He may continue for a long time, but sooner or later it will put him on the toboggan.

Work on the better side of the buyer's nature. You can do so by real salesmanship and will not have to buy your man.

Buyers Who Are Gullible.

This type is weak on Human Nature and Secretiveness. They are most often gulled through the faculties of Spirituality, Benevolence, Friendship, and Approbativeness. To take an unfair advantage of this type is wrong. When you see that they are easy, put yourself in their place and treat them as you would yourself.

To gain their confidence is easy. By treating them fairly and showing a genuine interest in them you can gain an influence that will be hard to overcome.

The Buyer Who Is a Hypocrite.

The genuine hypocrite has large Veneration and small Conscientiousness. He recognizes the value of religion as an asset in business. He wears a sanctimonious, sorrowing look. His voice will be forgiving, suave, and insinuating. The more sorrowful and sanctimonious his look, the more apt he is to be engaged in misleading some girl or defrauding some one by legal means.

When dealing with this type, adopt a suave and insinuating manner immediately and continue in the same way

unless he forgets or drops his mask and becomes sincere. If so, you must become sincere also.

There is another type of hypocrite that uses religion or a professed love of others to gain his ends. His manner is almost sincere and he uses strong logic or sophistry to deceive and gain his ends.

If a man professes a strong love of others, look at his Conscientiousness. It will tell the story.

The Honest Buyer.

Honesty is this buyer's distinguishing trait and comes from Conscientiousness. With large Firmness and Self-Esteem added to a large degree of this faculty a man will be unswervingly honest. Their faces will bear an honest expression and their eyes will be steady and open.

Be frank and open with this buyer for he dislikes anything secretive.

Buyers Who Are Good Judges of Human Nature.

These buyers have the faculty of Human Nature large. If their Individuality is also large they are generally correct in their first impressions of people. These two faculties are easily seen.

When the salesman is dealing with this type he must always be sincere and straightforward in his manner, for this buyer will follow your motives instead of paying attention to your proposition if you are not. Get his mind off you and draw it to your goods, unless there is a sympathy between you. If there is, use this sympathy to your advantage.

The Impulsive Buyer.

This buyer has some faculties that are predominant and the moment they are touched he acts or speaks without mature thought.

Rapid speech and animated manner distinguish these buyers. If they are combative toward you lead them to make some assertion that will be damaging to their opposition; then tactfully press your point. When all else fails use strong inhibition.

If they are in sympathy with you and your proposition their desire is easily awakened and consent of will is generally spontaneous.

The Buyer Who Is An Imitator.

Imitation comes from the faculty of the same name.

This buyer follows the example of others in conducting his business. All men are swayed more or less by example, but this buyer is strongly so. He is weak on Individuality, Ideality, and Constructiveness.

These buyers wish to have the same goods as the buyers who are more successful than themselves. If the other buyers are in the same neighborhood the Imitator wants them in order to cut the price.

Where the nature of a line is such that, if the same things are handled by two merchants in the same neighborhood, and will cause confliction, it is poor policy to sell the less successful merchant the same things that you have sold to the successful. You will first lose the

business of the successful and then that of the imitator, for he no longer has the successful merchant to imitate. It is best to hide the things that you have sold to the successful and sell the Imitator something else.

Where things do not conflict, the example of the successful is a strong weapon used on the less successful.

The Imitator will often ask if you have sold so and so. You can tell him that you have, but it is not necessary to tell what you have sold.

The Incredulous Buyer.

The incredulous are strong on the faculties of Human Nature, Causality, Comparison, and Secretiveness. They are generally weak on Conscientiousness and Spirituality.

This buyer will evince a disbelief of a salesman's assertions by his manner and expression, even though he says but little.

When dealing with this type, secure comparison for your proposition as quickly as possible, and reserve your strongest arguments, if possible, until your proposition is being compared.

Buyers Who Are Liars.

Lying is generally caused by Approbativeness and Secretiveness. Sublimity causes strongly exaggerated lies. When dealing with this type, do not appear to doubt them, but run in some point of your argument where you can pin them down, but do not show them up too strongly. Make it appear that you think that they are mistaken in their opinion, and not that they are lying.

The Mirthful Buyer.

The buyer who has large mirthfulness is easily provoked to laughter, and by causing him to laugh you can weaken the strength of his opposition toward you, especially if he is not strong on Firmness and if he has large Benevolence.

A buyer with small Firmness can be persuaded almost against his will when persuasion is mingled with laughter. But the buyer with large Firmness and Combativeness is not so much influenced by mirth. It is better, in fact, to be serious with him and only use laughter to induce forgetfulness of some point opposed, and to change the trend of the argument into a channel more favorable to yourself.

The Malicious Buyer.

Malice springs from the faculty of Destructiveness. This buyer will deliberately show ill-will toward a salesman without provocation. He will take pleasure in injuring your feelings without cause. His malice shows in face and manner.

The salesman should never appear to notice the buyer's maliciousness, but should show good-will instead. In this way you render his malice ineffectual. When you have diverted him from his purpose, you can proceed with your argument in a systematic way, but never until you have him conditioned.

The Methodical Buyer.

Method springs from the faculty of Order.

This buyer likes to conduct his business in a sys-

tematic and orderly way. You can see it by his place of business. When he is buying a line he plans his purchases beforehand, and if the buying is extensive will make out a list and consult it while buying, or have it memorized. He tries to limit his purchases to his needs, but he can be induced to buy more than he intended, if tactfully handled. By this I do not mean that a salesman should try to overload him, but that he is inclined to underestimate rather than overestimate what he can use.

This is a favorable type to do business with, for after they have given attention they are easily carried along by a well arranged and systematic selling-talk, or showing of samples.

The Optimistic Buyer.

Optimism springs from faculties of Hope and Self-Esteem.

This buyer will continually look at the brighter side of things, even though they are not running smoothly at the present. His face will show a buoyant spirit, even though it is submerged at the moment.

In your conversation with this buyer he will express his opinions of conditions, and if business is slow he will say that it will soon pick up.

Here is where the salesman can use a little enthusiasm, and this buyer is very susceptible to it. Tell him positively and convincingly that you know it will pick up; that some of the merchants of your acquaintance are now taking advantage of the lethargy prevailing among their competitors to acquire the business that is to be gotten by aggressively going after it; that they are having

sales, employing new methods, showing new goods; that they are advertising, and giving away premiums; that they are creating interest for themselves and drawing attention from their competitors, and that they are taking away their competitors' customers.

If your voice and manner is sincere and convincing you cannot fail to arouse enthusiasm in your man, and when you show him that your proposition will help him his consent of will is easily gained.

The Pessimistic Buyer.

The pessimist is weak on Hope and Spirituality, and strong on Cautiousness, Approbativeness, and Secretiveness. This type is generally in a state of depression and his face expresses discouragement.

At first you must fall into sympathy with this type and get him to unburden his woes. He will tell you that times are bad; that competition is too keen, and that prospects are poor.

Then you can agree with him in that competition is too keen; that some merchants are too aggressive; that they are having too many sales, and doing too much advertising. Then change your tactics and tell him how you helped a friend of yours in another town take advantage of the aggressiveness of his competitors. Tell him that your friend is a conservative man and does not like to spend too much money in creating interest in his store, for he feels that it takes away too much of the profits.

Tell him that at the time you called on your friend his

competitors were forcing business most aggressively, and that your friend was deploring the great waste involved in the methods employed.

Tell him that you conceived the idea of taking advantage of the interest that brought the people out on the street and that you suggested to him the advisability of starting a little sale that would catch the people as they passed along.

Tell him that you had some new things that were very attractive and so reasonable in price that they would show a good profit and still be bargains.

Tell him that these things were ordered for the merchant and when he received them he dressed up his windows and put out a sign. Tell him that the next time you called the merchant was highly gratified at the success of his sale.

Now turn the merchant's attention upon himself.

Tell him that you have some things that will surely attract business if well displayed. Describe them in such an enthusiastic way that he will want to see them, and you will then have a favorable start.

Of course a salesman cannot conscientiously use this self-same story if it is not in his experience. This illustration is merely to show you the line of attack to adopt. A salesman who has ingenuity and resourcefulness can easily draw the material from his own experience.

Remember that this buyer is in an inhibited condition and that you must accelerate the action of his heart.

Interest will do so.

The Suave Buyer.

Suavity comes from the faculty of Agreeableness.

This is the buyer who turns a salesman down so pleasantly and in such an agreeable manner that the unsophisticated salesman feels that it has been a pleasure to call on such a merchant. He does not realize that it is only this man's way of getting rid of a salesman.

After a salesman has learned where Agreeableness is located, and has noticed the facial expression that accompanies it, he can tell by a glance at the face that he has suavity to deal with.

When dealing with this type you should use suavity, and use it first. Do not give him a chance to use his suavity until you are well launched into your argument. If he attempts to interrupt you, slightly raise your hand and ask him to kindly let you finish. When he sees that he cannot overcome you with his suavity he will give you attention.

The Open-Minded Buyer.

This buyer is a man of pretty well balanced faculties. He does not pretend or think that he knows it all, but is open to conviction. His face and manner are pleasant and show that he is impressible to reason.

When dealing with this type, use an even voice and manner. Invite discussion, but lead the discussion along the line of your argument so that you will be in perfect control. When you have caused him to make enough admissions to show that he is well impressed, finish up

your argument, using a little sincere but careful emphasis.

The Taciturn Buyer.

The taciturn buyer is strong on Secretiveness. He is a man who is habitually silent. He does not like to be asked questions. His manner is reserved.

When dealing with this type come right to the point. State your proposition in a quiet voice and even manner. Your argument should be so well arranged, and the selling points so well brought out that he cannot fail to be impressed. This, coupled with your quiet manner, will induce him to discuss your proposition. Conduct the discussion in a quiet way and lead it along the line of your argument. Press any advantage in a quiet but positive manner.

The Suspicious Buyer.

This buyer is strong on Secretiveness, Cautiousness, and Acquisitiveness. He will show his suspiciousness in his manner.

The salesman must be perfectly open and straightforward in his manner toward this buyer. He should present his argument positively, but not antagonistically. He should invite comparison and when pointing out the superiority of his article should refrain from evincing any satisfaction that he may feel, but should take it as a matter of course. He should quickly follow up his advantage by further argument and make the buyer forget the attack on his Approbativeness, for you have shown up his poor judgment.

Only by being thoroughly honest in your manner, and by burying your personality in your argument can you persuade this buyer.

The Buyer Who Is a Plunger.

The plunger has large Calculation, Acquisitiveness, Hope, and Destructiveness. Cautiousness is moderate.

The plunger can be told at a glance. He is thick in the side head and especially at the corners of the eyes. He will be full in the head at this point. Narrow-headed buyers are never plungers. They get heart failure at the mention of quantity. Some of the narrow-headed are in a position where they buy large quantities, but their buying is not plunging.

Talk quantity to the plunger. The greater the quantity the more you will interest him. He will then want price. If you talk quantity you must be prepared to give price.

The Over-Cautious Buyer.

This buyer has large Cautiousness. His faculties of Firmness, Combativeness and Destructiveness are moderate or are weakened by disuse. He has allowed Cautiousness to rule the other faculties too long. He will be undecided and hesitating in his manner, and will be inclined to put things off. Do not be aggressive with this buyer at first, but take him easy. You can gain his attention by sincerely and positively stating what you can do for him, or what advantage or benefit he will derive from dealing with you. His Cautiousness will

incline him to investigate your proposition if you have impressed him.

When you are going over your proposition carefully, note his face without any interrogation or watchfulness in your look. When you see that you have him strongly impressed, and you come to the point of consent of will, and he wishes to put you off, suddenly change your manner to excitement and in strong and positive voice express your reasons against procrastination.

Your sudden change will surprise him, his mind will be sensitized, and your ideas will have powerful effect. If you do not gain consent of will, you may be sure that your voice and manner were not strong enough nor convincing.

Buyers Who Are Observers.

The experienced salesman will no doubt remember that many of his buyers have been very quick to perceive and grasp the details of a thing at first sight, while others required some time to think it over.

The reason for this is that the one of quick perception was endowed with strong perceptive faculties and the slow one was weak on these faculties.

Buyers who are observers have large Individuality. Add to this large Size, Form, Color, Order, and Calculation, and you have one who can distinguish even slight differences almost at a glance. This type is quickly recognized by the prominence over the nose and eyes. When one of this type has a forehead that slopes backward, he will be a man who judges quickly, if not cor-

rectly. This is due to small Causality and Comparison. Do not dwell on details that are apparent to the eye when dealing with this type, for he will interrupt you or pay little attention to what you are saying. He has already seen these details and should be guided through the essentials not perceptible to the eye.

This type is the opposite of the thinker, which follows:

Buyers Who Are Thinkers.

The reflective faculties are Causality and Comparison, and it is these two that make the thinker.

A buyer with the reflective faculties large and the perceptive faculties small, must be pointed out the details of a thing, for he is not quick to see them, and must think and reason them out.

When dealing with this type, a salesman should carefully explain the details of his proposition, and systematically guide his mind from point to point, giving him ample time to think as he goes along. Never use rapid speech with this type, but talk in a low and deliberate tone. A buyer with both the perceptive and reflective faculties large is quick of perception and a rapid thinker, unless an intricate point is in question.

THE REASONING USED IN A SALES ARGUMENT.

In the presentation of a selling argument a salesman uses sound common sense expressed in language that fully and clearly brings out the ideas he wishes to impress upon the buyer.

The salesman need not be a logician to reason soundly. He need not be a grammarian to speak correctly, nor need he be a rhetorician to speak effectively.

There are two methods of reasoning—the Inductive and the Deductive. The process of reasoning is the same in both. The difference lies in the source of the knowledge; that is, in the knowledge from which we start to reason.

All our reasoning springs from two sources. It springs either from what we know by actual experience and observation, or from authority.

To reason from experience is to use knowledge that is gained by actual contact with the thing reasoned of, and the impressions that create this knowledge come through the senses.

But to reason from authority is to use knowledge or opinions that come from words either verbal or written.

This comes through the senses of sight and hearing also, but it does not come from actual contact with the things reasoned of.

Inductive reasoning is the reasoning from experience and observation.

Deductive reasoning is the reasoning from authority that is founded on accepted facts, or is an argument that springs from opinion, or supposition.

We never feel certain as to the accuracy of the conclusion of an argument unless we derive the truth of the conclusion from experience.

Also, we cannot always furnish enough evidence from experience and observation to warrant the forming of a convincing conclusion, and it is therefore necessary to draw enough argument from further facts not directly connected with the proposition, or from opinions or suppositions, that will enable us to form a reasonable conclusion.

A salesman must use Induction and Deduction together when he is presenting his sales argument.

These two methods have different ways of expression and are as follows:

Reasoning by Syllogisms. A Syllogism is a fully expressed form of an Inductive or Deductive inference. That is, everything connected with the reasoning is set forth explicitly. It is not necessary to directly state everything. Much can be implied.

The salesman uses this form of reasoning when he demonstrates or proves a point as he goes along. The entire sales argument should be in the form of a

syllogism. That is, the syllogising or reasoning together of the separately assumed or admitted parts should maintain consistency and tend to the one conclusion that the salesman wishes to arrive at.

Reasoning by Analysis. This is the separating of the proposition into its essential parts.

Before a salesman can thoroughly and intelligently elucidate his proposition to a buyer, he must first have thoroughly analyzed the proposition himself, and have duly considered each part separately, drawing out the important and rejecting the unimportant. The important parts constitute the selling points. Thorough knowledge of a proposition is essential in building a sales argument.

Synthesis is the opposite of Analysis. It is the combining of the different parts after analysis.

Synthetical reasoning is the proceeding by a regular chain from point to point, as they are established, until the conclusion is arrived at. It systematically arranges the points so that each one sustains or strengthens those preceding it. It inducts the proposition into the mind of the buyer so that he sees it exactly as the salesman does.

In synthesis lies the power to persuade.

Reasoning by Conversion. This is the changing of the subject of a proposition into the place of the predicate. Every proposition has a subject and a predicate. The subject is the thing that is being sold. The predicate is that which can be affirmed or denied of the subject. Where a buyer is familiar with the subject of a proposition it is already established, or is thought to be, and

the salesman reverts to the predicate; that is, he affirms the desirability or advantage of his subject, and removes objections and denials. In this way he works back to his subject and establishes it as he wants it to be.

Where the buyer is unfamiliar with the subject of a proposition, the subject must be thoroughly explained and its use or purpose made clear.

Reasoning by Opposition. This is where a buyer opposes another proposition against the one the salesman is selling. That is, the two propositions have the same subject and predicate, but they differ in quantity, quality, or both.

Reasoning by Comparison is the bringing together of things, either in the mind or in the actual, for the purpose of ascertaining their likeness or difference.

Reasoning by Contrast is the setting in opposition of different things to show the superior excellence of one to advantage.

Reasoning by Analogy is the deducing of inferences from some agreement or relation which things bear to each other.

Reasoning by Example is an induction of what may happen from what has happened.

For instance, if one merchant has made a success of a thing, it may be inferred that another merchant in like circumstances can do so.

Hypothetical and Categorical Propositions. Hypothetical reasoning is based upon a supposition. Categorical propositions are positive and absolute.

There is this to be said for hypothetical reasoning:

If a buyer will allow a salesman to base an argument on a supposition the salesman can reason to the heavens and back again, and so word his argument that the buyer cannot directly oppose him. But there is this to be said against hypothetical reasoning: Some buyers, as soon as they hear the word "suppose," fly up in the air and yell, "Suppose nothing!" It is therefore best that the salesman omit the word "suppose" from his argument except in some cases where it is necessary to be negative.

It probably never occurred to the salesman that every time he opens his mouth to speak he is reasoning in one form or another; either by direct or indirect argument, or by suggestion that implies an act of reasoning? Yet this is so, and it must therefore be apparent to one that the cultivation of logical reasoning is indispensable to successful salesmanship.

A man's mental calibre is instantly revealed by the manner and correctness of his reasoning. If his reasoning is at fault, he cannot hope to impress those who are experienced and well informed.

Correct reasoning springs from sound judgment, and sound judgment must have knowledge as its basis. Judgment is supposed to supply want of certain knowledge, but it requires other knowledge to supply this deficiency.

THE FOUR STYLES OF PRESENTING A SALES ARGUMENT.

The Assertional or *Declarative style* is the advancing of a proposition by assertions and explanations.

This is the winning style, but its efficacy depends upon the voice and manner of the salesman.

The Imperative style conveys command, advice, and exhortation.

The command should lie in suggestion. Use advice conditionally. Use exhortation only when driven to extremes.

The Interrogative style is the asking of questions. Questions should rather be used to elicit opposition that you can overcome rather than as an influencing agent, except in such cases as were shown in the handling of the buyers.

Where a buyer honestly concedes a point he is influenced by it, but where a buyer dishonestly concedes a point the salesman is misled, and the buyer is not influenced.

Questions also suggest secretiveness and will often tend to weaken the advantage a salesman has already

gained, especially if there is any doubt remaining in the mind of the buyer.

Questions also suggest contention, and where this has not been the purpose of the salesman he will often be obliged to overcome objections that could have been avoided.

By carefully studying the different types of buyers that we have dealt with you will know when and how to use questions.

The Conversational style is a quiet discussion of a proposition and is generally used when dealing with friends and equals. When using this style the salesman should always lead the conversation along the line of his argument.

At the beginning of this chapter it was stated that the Assertional or Declarative style is the winning style of presenting a sales argument. This is particularly so when delivered in a matter-of-fact voice. When this tone of voice is used, it often borders on, or descends to, the conversational style. The salesman should be warned that while the Conversational style is calculated to place the buyer and salesman on terms of equality, and is the basis of heart-to-heart talks, this style is displeasing to some men, especially if one is a stranger. Should a salesman happen to make this mistake, he can quickly remedy it by reverting to the Interrogative style.

In the chapter on building the sales argument is given a selling talk delivered in the Declarative style. It will be found worthy of careful study.

FIVE RULES FOR CONTROLLING THE SALES ARGUMENT

In order to have perfect control of the argument from beginning to end, the salesman must be prepared to overcome or prevent the following ideas or opinions that may be in the buyer's mind or may occur there.

The first is a preconceived opinion of your proposition that is erroneous. It may amount to prejudice.

A salesman must therefore consider everything concerning his proposition that is likely to create prejudice where it is not understood, and be prepared with convincing arguments that will prove to the buyer that he is wrong.

The second is to compel close observation of your proposition.

A buyer that has a preconceived opinion that is opposed to your proposition will not observe closely, or if he does he will wish to find that he is right, rather than wrong, in his opinion.

You must compel close attention and bring out everything in your proposition so fully and clearly that he cannot evade a fair judgment.

Then again a buyer who is not prejudiced may be mistaken in his perceptions by not having observed closely. He is apt to draw a rapid inference that is prejudicial to your proposition. You must therefore compel close attention and bring out everything clearly.

The third is where a buyer will assert that your proposition is impossible, or express strong doubt to that effect.

You must know what there is about your proposition that will cause him to make this assertion, and be ready to explain it away and satisfy him that your proposition is not impossible.

The fourth is to anticipate arguments that will occur during an interview and explain them away before the buyer advances them, unless you have a purpose in letting or causing him to do so.

By this I do not mean that you should anticipate petty arguments or non-essentials, but those points upon which the sale will hinge. In a selling argument that follows you will see how this is done.

The fifth is to avoid confusion.

If a salesman scatters his arguments, or uses words or expressions that are ambiguous, they will create confusion and the buyer is likely to draw erroneous inferences.

Present your arguments coherently, and in language that fully express your ideas and leaves no doubt of their meaning.

BUILDING THE SALES ARGUMENT.

The building of a sales argument is the arranging of the selling points and auxiliary ideas in their proper order so that all unite to form a conclusion.

To illustrate: The following lines are selling points and must be arranged in their proper order:

And wouldn't it be wiser
Will it make it any easier
Suppose your task, my little man
Than waiting like a dunce
And learn the thing at once
Is very hard to get
To go to work in earnest
For you to sit and fret.

These lines mean very little as they stand, but after arrangement they bring out a logical conclusion:

Suppose your task, my little man,
  Is very hard to get;
Will it make it any easier
  For you to sit and fret?
And wouldn't it be wiser
  Than sitting like a dunce

To go to work in earnest
And learn the thing at once?
—Phoebe Cary.

There are three elements that enter into the building of a sales argument, and are as follows:

First. The proposition, goods, or thing to be sold.

Second. Conditions.

Third. The workings of the buyer's mind.

The proposition must be established by bringing out the cause of, or reason for, its existence; its use or purpose; its qualities that make it desirable; and its connection with the buyer.

Conditions are general or particular. Of the general conditions, hard times and dullness of business are the most common.

I have always worked with the idea in mind that, no matter how hard times are, or how dull they are, there are always some goods being sold, and that the salesman who will awaken his ingenuity and apply his resourcefulness can get some of that business.

During the late panic the writer was employed in the selling of ladies' silk waists.

At one time business was brought to such a point that it had to be forced. I went to the buyer of one of the largest department stores in Chicago and offered to sell him one thousand waists of a particular style and color at a certain price. He immediately set up a howl that he was not in the wholesale business.

I replied that I knew he was not but that he could

easily sell one thousand waists by placing them on sale and advertising them; and that it only involved an outlay of two thousand, seven hundred and fifty dollars.

He finally calmed down and asked me what price I would sell the waists at if he would buy one hundred. I raised the price reasonably and secured his order. The quantity was twice what he would have bought ordinarily.

A little later I went back for a re-order and was told that he did not think he wanted any more, because he could not use the quantity.

I quietly told him that at the time I sold him the others I was obliged to force business, but now things were running smoothly and he could get his own quantity.

When I told him this he gave a start and had a strong impulse to anger, but he did not give vent to it. I knew my man.

Instead, he gave me an order for the regular quantity.

A little later I received an order for one hundred more of the same waists and one hundred and fifty more of different styles.

To another buyer I went to close out some waists that we had on hand. Before seeing the buyer I went to the department and looked over the waists lying on the counter. I saw a waist that I liked particularly well and asked the saleslady if that style was selling. She replied in the affirmative.

I then went to the buyer and succeeded in selling the waists to be closed out. After the sale was made I told the buyer that I had seen a waist on the counter that

I would like to make. The buyer asked me which it was and I went to the counter and brought the waist to the buyer. I was given permission to make a sample and when I submitted it to the buyer was immediately given an order for seventy-five waists.

Through confidence and by keeping in touch with this buyer I secured a very nice business through the worst time of the panic.

Another buyer I influenced by the argument of what I was doing with other houses. I pointed out that as I was getting good business from other buyers right in the face of hard times I must certainly be in a position to interest this buyer.

The buyer looked over my samples and selected a few styles. I was told to come back the next day for the order. When I came for the order the buyer was not ready.

Waiting until the following day I called up the buyer on the 'phone and stated that I must have immediate action on the samples as the buyer across the street wanted them, but not if this buyer had them.

I was told that what the buyer across the street wanted to do did not concern this buyer, but that I should expect a telephone call within an hour. The telephone call came and I was told to come and get the order.

By keeping in touch with this buyer I was able to get much business that would otherwise have gone to someone else.

There was another condition that I overcame at this time and that was bad health; in fact, I was very ill for

some time. But by a supreme effort of the will I forced myself to work three or four hours a week and in these few hours secured enough business to keep the factory busy.

The salesman who will not allow conditions to overcome him can overcome conditions.

Particular conditions lie in the peculiarities of a line or in the dealers who buy the line. Everything being sold has peculiar conditions that must be overcome before a sale can be made.

These conditions are so many, and so varied, that I will not attempt to describe them here, but I will show in a selling talk that follows how I overcame conditions opposed to a specialty I was engaged in selling.

We will now see how the buyer's mind works and why the sales argument must be framed accordingly. The salesman must remember that he must have consent of will from the moment that he gains attention to the closing of the sale. There is but one thing that will gain consent of will and hold it and that is a motive. This motive must run all through the transaction. The will is a whole and cannot be divided, but it has different phases, which are as follows:

Motive. This is the feeling that prompts the will in any one case.

Deliberation. This supposes conflicting motives.

Resolution. This is a volition, or willing with the act deferred.

Desire. This feeling prepares the mind to give final consent of will.

Belief. This is the last phase, and is preparedness to act.

We will see how this works out.

The salesman makes his approach and introduces himself. The introduction should consist of stating the firm that the salesman is representing and what their business is. If the salesman tenders a card, his name should be thereon. The handshake should only be used with equals or where you see that sympathy exists.

So far you have given the buyer no motive to listen to you except that of simple courtesy, so you must give him a real motive. This you do by stating the nature of your business. In many cases a buyer will abruptly say that he is not interested. It is here necessary to tell you that there are two kinds of will—the Evocative and the Directive.

When the will is Evocative it is dormant and needs calling forth. When it is Directive it is in action. If it is Directive and in sympathy with you it only requires sustaining. If it is directed against you it must be reversed. There is but one way to reverse the will, and that is by inhibition. You already know how to use inhibition. When the motive is broached and the buyer has given you attention, the next step is to state something regarding your proposition that will create a favorable opinion of it. A buyer's opinions are influenced by his self-interest, his inclinations, and his passions.

Self-interest affects the faculty of Acquisitiveness.

From the purely commercial side the following faculties are influenced by inclination or passion:

Locality, Imitation, Ideality, Constructiveness, Calculation, and Order.

Locality. A buyer may have an inclination or a passion for buying his goods from some particular market. He is influenced by price, quick delivery, express or freight rates, or he may simply have a biased feeling in favor of the market, that springs from no particular reason.

Have your talk prepared on these points, either for or against.

Imitation. A buyer may have an inclination or passion for following the example of others. He is influenced by what others do.

Ideality. A buyer may have an inclination or passion for things that are beautiful and refined. He is influenced by the artistic appearance or superior excellence of a thing.

Constructiveness. A buyer may have an inclination or passion for inquiring into the construction of things. He likes to see how they are made. He is influenced by any peculiarity of construction.

Calculation. A buyer may have an inclination or passion for buying large quantities of things. He is influenced by quantity and price.

Order. A buyer may have an inclination or passion for conducting his business in an orderly manner. Things pertaining to system influence this buyer. The salesman must analyze his proposition and have his arguments on these points framed ready for instant use. When the salesman determines on the use of these points, he sizes

up the buyer's place of business before his approach, and looks for the faculties when he introduces himself. The faculties are seen at a glance as they are all in the front part of the head.

When the salesman makes his statement regarding one or more of these points it starts the buyer's faculties of Causality and Comparison to work and Deliberation sets in. To prevent the buyer from forming any wrong conclusion the salesman does not leave the deliberation to the buyer but argues so convincingly for his proposition that the next phase sets in, which is Resolution. That is the buyer resolves to go farther into the matter. An element of desire has been created. He may have formed a resolution that if the thing is as the salesman represents it to be he wants it or can use it.

If the salesman has not been convincing aversion sets in and the belief that he does not want the thing follows. The initial desire must now be augmented into a wish or longing.

Here some of the following faculties are brought into play in addition to any used of those already mentioned. They may have been used during Deliberation, but here they are brought out more strongly. Individuality, Form, Size, Weight, Color, Tune, Time, Eventuality, and Language.

From a purely commercial standpoint the faculties that come under the head of deliberation are those which buy to sell again. The perceptive faculties just named are those which help to pass upon a thing's desirability. But the faculties which buy to sell again must consider

a thing from the consumer's point of view. This brings one or more of other faculties into play.

For instance, Approbativeness will buy fine clothes. Alimentiveness buys things to eat and drink. Destructiveness will buy a gun. Secretiveness will buy a desk with secret drawers in it. Inhabitiveness will buy a home. Parental Love will buy things for children. In fact every one of the forty-two faculties buy, or help to buy, something. Some of the faculties will work for a salesman, others against him. When a faculty is working against a salesman it has too much blood in it. The idea in the faculty must be inhibited.

As was stated in the fore part of the book a salesman can play upon a certain number of the senses. He must consider how his proposition will affect the senses; whether the effect will be pleasing, indifferent, or displeasing. If the effect is pleasing it should be augmented. If the effect is indifferent, or displeasing, there is a reason for it, and it is generally based upon necessity. Remember this: That any opinion a buyer may have that is favorable or unfavorable toward you can be either augmented or inhibited through the sense of hearing by literal explanations, or through figures of speech. The use of figures of speech is to make an idea or thought more attractive or striking. The different figures of speech are as follows:

Simile. A simile is an expression that likens two things that are different, but have a point of resemblance in appearance, actions, qualities, or in producing the same effect.

Example: A salesman is showing a mattress to a man who complains that he cannot sleep well on the mattress he is using. The salesman gives his selling talk on the mattress he wishes to sell and ends up by saying, "It will induce rest and sleep like a soothing and harmless opiate." This is a simile.

Metaphor. A metaphor is also founded on resemblance, but the resemblance is implied instead of being formally expressed.

Example: A salesman selling some device that will reduce operating expenses, says to a prospective buyer, "From wastefulness to economy is but a matter of system." The word system implies that it will effect economy.

Allegory is founded on resemblance, but it takes the form of a fable, parable, or fictitious story that furnishes an illustration or points out a moral or conclusion.

Example: A salesman is trying to sell a buyer something, but the buyer is very obstinate and refuses to believe some assertion that the salesman has made. The salesman sees that it will be almost impossible to prove his statement while the buyer is in the present mood. He sees that he must inhibit the idea that is in the buyer's mind, so he says, "Mr. Jones, you put me in the position of the man in the fable who was discussing with a lion the relative strength of men and lions in general. The man contended that men were stronger than lions by reason of their greater intelligence. He said to the lion, "Come with me and I will prove that I am right."

So they went to the public gardens and the man showed the lion a statue of Hercules overcoming the Lion and tearing his mouth in two.

"That is all very well," said the lion, "but proves nothing, for it was a man who made the statue."

"Mr. Jones, I didn't make the statue, but I did make an assertion. I am not going to ask you to go to the public gardens, but I will ask you to take your mind over to Monticello. You know Black & Co. and Tom Johnson over there. I have been selling them this same article for a year and they have had splendid success with it. You have the same class of trade as theirs, and it is logical to infer that you can do as well with it as they have been doing. If you want me to, I will call Mr. Black up on the long distance telephone and ask him which way he finds it easiest to sell the article. I will tell him the information is for you, and I know he will give it to me. When I was over there we happened to mention your name, and got to talking about you. I know that Mr. Black likes you. Shall I call him up?"

The buyer has become calm while the salesman has been talking. The moral of the fable flattered the buyer's intelligence. He sees that the article is successful, and is pleased to know that Mr. Black has a favorable opinion of him. He does not wish to call Mr. Black on the phone, so he says, "No, I don't think you need to call him up. Let me see that thing again."

The use of an allegory, an anecdote, or a true narrative has the effect of diverting the buyer's mind from opposition and gives the salesman an opportunity of

leading up to a point in a manner that is pleasing to the buyer.

Personification. This is attributing life to an inanimate thing or to an abstract idea.

Example: A salesman is dealing with a buyer who wishes to put off buying until later. The salesman says, "Mr. Brown, Procrastination is the thief of time and profit."

In the present case this should be carried out by the salesman reverting to the points of his argument that the buyer has been impressed by, and ending up with some particularly strong argument. It should all be expressed with strong feeling.

Antithesis. Where words that are opposed to each other, or form a contrast, occur in the same sentence the figure is antithetical.

Example: A salesman is selling a thing that is new. He presents his proposition to a buyer who tells the salesman that he prefers to continue handling what he has because it is advertised and well known. The salesman says, "Mr. Reed, the character of goods lies in what they are; the reputation of goods lies in what people think they are." Character and reputation are contrasted.

The salesman should follow it up by saying, "My goods have character and distinctiveness. They do not need reputation to sell them. You say that the other goods are advertised. My goods do not need advertising; they will sell on sight. Here, consider this article and the one you are handling. Which would you choose for your own use? Mine? Certainly! So will your trade; it only

requires a few words of assurance to your customers and they will buy this article. They will be better pleased, and you will make a bigger profit."

Epigram. An epigram is a brief pointed saying. Example: A salesman is selling "Blackbird" fast black hosiery. He says to the buyer, "The fastest colors are those that won't run; the less they run the faster they go."

This is an epigram. It should be followed up something like this: "Blackbird hosiery goes swiftly; it flies." Mean it, don't joke it. Go ahead and tell of its success, and why it is successful.

Metonymy. This is changing the name of one thing to another, but the mention of one suggests the other.

Example: A salesman is showing his line of ladies' dresses to a buyer in his own store. The buyer gets one of his dresses to compare with one of the salesman's. The buyer is not sure as to the superiority of his dress, but puts on a bold front and says, "There! what do you think of that!"

The salesman looks at the dress, and says, "It looks to me like a phantasmagorical production of a disordered brain." (Meaning that the man who designed it was crazy.)

He then goes on to pick out the flaws in the garment to prove his assertion.

You can find flaws in anything if you wish to be fair minded. Such words and expressions as pippin, gold mine, red tape, gray hairs, etc., are commonly used metonymically.

Synecdoche. This is a figure which consists of putting the whole for a part, or a part for the whole.

Example: A salesman says regarding an article that is well known, "The world knows its value." (Whole for a part.)

Interrogation. This is a figure of speech that asks a question. Example: A salesman is dealing with a buyer who wants a lower price. The salesman says, "Mr. Smith, can you draw water from a well that is dry?"

Hyperbole. This is a figure of speech that exaggerates for effect.

Example: A salesman is selling a small but valuable book. He says to his prospective buyer, "The book is about as big as a minute, but its contents are the concentration of centuries."

Irony. Irony suggests the contrary of what is expressed. When you praise a thing, meaning to ridicule it, you use irony.

Example: A salesman is showing a line of shirts to a buyer in his own store. The buyer thinks he has something better. He gets one of his shirts and shows it to the salesman, saying, "What do you think of that?"

The salesman sees that the shirt has been skimped in the making, so he quietly says: "It's great. What I admire about it more than anything else is the ingenuity of the manufacturer who can make a size 17 out of a size 14½."

Vision. This describes the past, absent, or the imaginary as if it were actually before our eyes.

Example: A salesman is showing phonographs to a

prospective buyer who intends to make a present of one to a friend who has a family.

The salesman wishes to clearly establish the place, persons, and object in the buyer's mind, so he asks what kind of music they like, and about the home.

The buyer tells the salesman, who suggests the kind of phonograph to buy and the kind of music they would appreciate. He ends up by saying, "As a surprise for them, I would not send a card with it or let them know from whom it came, but I would put a blank record in the phonograph and talk to it just as you would when presenting it to them in person. I would then take the record and pack it so that when the package is opened they will see it first. Mark on the record, 'Play this first.'

"I can just imagine the look of wonder and pleased surprise on their faces as they stand around the table listening to the machine. They will see you in their mind's eye in a way that will endear you to their hearts as long as they live."

Vision is contained in the last sentence. The balance is merely description.

Litotes. This is the making of a statement by denying its opposite.

Example: A salesman is showing an article to a buyer who does not like its appearance. He says to the salesman, "It's an ugly thing." The salesman replies, "It is not made for show." (Meaning it is made for practical use.)

Allusion. This is a reference to some familiar expression, or event, for the purpose of illustration, explanation, or description.

Example: A salesman tells a buyer that he can use the thing that the salesman is selling as a "Big Stick" against his competitors.

Euphemism. This is the substituting of agreeable names or expressions for those that are disagreeable.

Example: Overcharges are called errors. Lying is called over-active imagination, thoughtlessness, or mistaken ideas. Excuses are called reasons. Extravagance is called necessity. Indecency is called art. In fact a pleasant name can be found for anything that is unpleasant. It all depends upon the point of view, and how much your self-interest is involved.

The reader no doubt wonders why I have introduced the figures of speech here in the phase of desire instead of treating them separately. I will tell you. There lies in figures of speech a suggestiveness so powerful in its effect in inhibiting aversion and augmenting desire that it cannot be too strongly impressed upon your mind. That is why. We have seen that the salesman has supplied the buyer with a Motive. The buyer has Deliberated upon the Motive. He has Resolved to go farther. We have seen that the salesman can play upon a certain number of the senses and that his proposition effects certain faculties. He plays so successfully upon these faculties through the medium of the senses that Desire is aroused. The next and last phase is Belief, and it is here where the will decides to act. It is here where the mind

is persuaded to assent to the opinion that the buyer can use the proposition being sold, and the will gives its consent.

In the beginning of the book it was stated that there is a difference in the workings of the minds of the Intellectual and Emotional Buyers. The names of the different stages given there are only general and are for general apprehension. Now that you know what the five phases of the will really are they mean but little to you.

The real difference between the two is this. The Intellectual buyer is calm and calculating. His faculties of Causality and Comparison are constantly at work. He does not allow desire to sway his reason. He is constantly analyzing what is presented to his mind. The phase of belief means to him a logical conclusion. The Emotional buyer is different. The mere sight of the article, or one of its selling points, may arouse his desire to such an extent that it greatly impairs the working of Causality and Comparison and he does not fully analyze the proposition. Or he may be so strongly influenced that his Causality and Comparison almost cease working and he accepts everything on simpe faith.

There are three kinds of belief in salesmanship. The first is the belief that is the outcome of pure reason, and springs from the faculties of Causality and Comparison.

The second is that of simple faith and springs from the faculty of Spirituality. This is blind confidence and has but little of reason in it.

The third is a combination of reason and faith. It is strong confidence that has much of reason in it. This

is a combination of Causality, Comparison, and Spirituality.

Belief is influenced by the faculty of Acquisitiveness; and Acquisitiveness, from a purely mechanical standpoint, is influenced by the following faculties:

Hope. From this faculty springs the hope of profit.

Ideality. From this faculty springs the love of the beautiful or ideal.

Imitation. From this faculty springs the desire to follow the example of others.

Locality. From this faculty springs the desire to favor some particular market.

Constructiveness. This faculty influences Acquisitiveness by its appreciation of superior construction or composition.

Order. From this faculty springs the love of system.

Calculation. From this faculty springs the desire for price and quantity.

Combativeness. From this faculty springs the desire for things that will combat competition.

Destructiveness. From this faculty springs the desire for things that will kill competition.

We will now see how a proposition is analyzed. The following will about cover everything from the commercial standpoint:

The Proposition. What is its use or purpose? What is the cause of, or reason for, its existence?

Action. What is its effect when in action? Is it an article of wearing apparel, and is it so beautiful in

appearance that it will cause a person to forget prudence or economy and impel them to buy it?

Is it an automobile that speeds like the flash of a thought? Is it a cigar whose fragrant perfume lingers in the mind of the smoker and at every desire to smoke causes a remembrance of its name?

Is it a whisky whose mellowing influence creates a feeling of good-will and love toward all mankind, or is it full of bad thoughts and deeds?

Is it a machine whose efficiency is so great that it will take the place of many men?

In fact, what will your proposition do?

Under this heading ask yourself these questions: How does it look? How does it feel or fit? How does it taste, smell, or sound? What effect will it produce?

Quality of Trade. What class of trade is it adapted to?

Quality of Construction or Composition. What is it made of? How is it made? Is the material good, or only indifferent? If so, why so? There's a reason.

Manner. What is its manner of production? What is its manner of handling? Does the manner of production and handling affect the quality and price?

Comparison. How does your proposition compare with what will be put into competition with it? Does it compare favorably with others? There must be something about your proposition that will make it desirable in the face of competition. Call up your resourcefulness and ingenuity. If you admit that your proposition cannot compete with others, then you are done for, and have

no excuse for handling it, unless it is that you need the money, and that is a motive the buyer will not accept.

Quantity. What quantity is it sold in? How is it put up?

Price. Is the price reasonable or is it a little high on account of superior quality of material and workmanship? Is the law of supply and demand affecting the price, or is it only a matter of opinion? Is your price cheap? If it is you must have a very reasonable explanation for its being cheap, otherwise you may create the opinion that there has been a fall in prices, that your proposition is not as you represent it, or that your goods will not come up to sample.

Terms. What are your terms, and why are they so?

Time. How long does it take to make your article, or is it carried in stock? When is it to be shipped?

Place. Where is it to be shipped from? Where is it to be shipped to? What is its effect upon freight rates?

Direction. By what route is it to be shipped? Is the route selected on account of freight rates or on account of quick delivery?

Affirmation. What must I assert regarding my proposition?

Negation. What must I deny, or explain?

Interrogation. What must I ask the buyer that I cannot tell from his manifest experience in order to present some point more intelligently or effectively?

Order. What is the relative strength of my selling points and in what order shall I arrange them?

Write down your selling points and revise them until

you have a clear, smoothly running, and convincing argument.

I will now give an example of a sales argument and then analyze it.

This is a sales argument that I used while selling a specialty. It proved very successful with me and has landed all classes of buyers from the most representative to those of the smaller type. In some instances I was obliged to change the argument a trifle, but the variations were so slight that it did not affect the body of the argument. This argument is adapted only to the buyers in the retail stores. To the buyers in the mail-order houses I used a different argument. I sold five of the mail-order houses in Chicago through an argument based upon what the sixth one did not do. This shows you what you can do with a single idea if you only take advantage of it. The argument is as follows:

"Mr. Smith, I am representing the Hall-Miller Co., of Chicago, manufacturers of Dr. E. E. Hall's All-Metal Expanding Douche Point. (I would produce the instrument.) This is the only instrument of its kind that can be expanded to any size required. It is regulated by turning the dial. (I would turn the dial and the instrument would expand.) The expanding points are held firmly in place at any degree of expansion. (I would squeeze the points.) When the instrument is inserted within the parts the walls are fully expanded, leaving a perfectly smooth surface, so that the water or medication reaches all parts of the canal. (I would hold up my hand and open and spread the fingers.) After the instrument has

been used it can be sterilized by being placed in boiling water, for it is all metal and there are no parts that can be destroyed by the heat.

There is no other syringe on the market that can be sterilized, for they are all made of rubber, and rubber is softened by the heat.

A douche point that cannot be sterilized is dangerous, for it can cause reinfection after having been used to treat infected parts.

In order to thoroughly sterilize the instrument it should be taken apart. This is done by pressing the button and slipping off the shell. (I would do this, the instrument would fall apart, and I would spread out the pieces.)

The instrument is easily put together again. (I would put the instrument together, work it a few times, and hand it to the buyer, who would look at it, work it, and would then ask the price.)

The price is $24.00 per dozen. The retail price is restricted to $3.00.

(The buyer would consider a moment and would then say, "I don't think I can get $3.00 for it; they can buy other douche points for less money.")

Mr. Smith, I have already shown the superiority of my instrument, and could now reply that it is cheaper than any other syringe in the long run, for it is all metal and is indestructible. It will last a lifetime, while other syringes have to be replaced quite often. But that is not a convincing argument.

The first day that I took hold of the instrument I found

that the buyers liked it, but it was new and untried, and they were afraid that they could not get the price.

Those that I sold it to acted as though they were buying against their better judgment, and I knew that when they received the instruments they would make but little effort to push them.

The next few days were the same, and at last I concluded that the only way to prove the instrument was to put it on public demonstration.

This I succeeded in doing, and it is now being demonstrated at (here I named three stores) and has been for some time.

The fact that we are allowed to continue with our demonstration is proof that we are making a success, for floor space in these stores is too valuable to be wasted on failures.

These three stores cover the upper, middle, and lower classes of trade, so you can see that the sale of the instrument is not confined to any one class. When the demonstrators started to work I instructed them not to talk up the instrument to those who came to the store for the express purpose of buying a syringe, but simply lay out the different syringes, take our syringe, work it a few times, and lay it beside the others. Invariably the customer picks up our syringe and wants to know about it.

The demonstrator simply says, "That is Dr. E. E. Hall's Douche Point. The other syringes do not irrigate thoroughly, that is why Dr. Hall invented this."

She then takes the instrument apart, puts it together, and tells the customer the price.

If the customer complains that the price is too high the demonstrator says, "No, the price is reasonable. It cannot be sold for less. The only question that you must settle with yourself is whether you can afford to take chances with your health in order to save the difference in price, or whether you want to buy the best and get quick and thorough results. This instrument is really the cheapest because it lasts a life-time." The demonstrators report that in almost every case the customer buys our instrument, and I construe this to the fact that there is no apparent influence on the part of the demonstrator. The customer's mind is simply directed into the right way of thinking, and they cannot fail to see the benefit of buying our instrument.

When the demonstrators deal with those who had no intention of buying a syringe before they were attracted to the demonstration the demonstrators are obliged to do a little more talking, and they report that sales are often made to those who already have a syringe but find them inefficient. Many who have not the money with them come back the next day, or later, to buy one.

Now this is sufficient proof that the instrument is a seller, but the most convincing proofs of all are the reorders we are getting from the dealers that had no demonstration but simply bought them because they saw better profits in ours than in the others. They have no competition because the price is restricted. They were quick

to see that it only required a few simple statements to guide the customer's mind into the right way of thinking.

We will furnish you with booklets to send out in your packages like the others are doing. The rest you can do by placing the instruments where they will attract attention.

(I would stop right here to give the suggestion time to operate, and would generally land my order without further argument.)

The conditions were these: the thing sold was constructively attractive, and desirable for its efficiency, but its salability was untried, and it was not advertised. The class of dealers who handle goods of this kind dislike to adopt anything that is not advertised, or requires any talking to effect a sale.

This I was prepared for, but gave no intimation of my knowledge until I had the buyers properly conditioned to receive the argument that was intended to overcome this aversion. Instead I dwelt on the price and treated the aversion incidentally but convincingly.. I forced the buyer to ask the price for a two-fold reason. The first was to make him show his interest. The second to create a favorable opening for persuasion.

When I named the price I knew perfectly well what the answer would be, for I had proven it by experience.

I had my argument so constructed that after his first and only objection the buyer was left no opening to start an argument or dispute. I convinced and guided his mind at the same time. This is following the line of least resistance.

We will now see how I followed the five rules for controlling the argument.

First. I was thoroughly prepared to overcome any opinion that was prejudicial to the instrument.

Second. I compelled close attention by bringing out the details fully and carefully.

Third. I proved that it was not impossible to get the price for the instrument.

Fourth. I tactfully anticipated the arguments that the buyer would bring up.

Fifth. I avoided confusion by expressing my ideas clearly and by presenting my argument in a coherent manner.

The five phases of the will were passed through as follows:

The Motive was established when I produced my instrument. The faculty of Causality was first aroused and Amativeness affected, but I immediately inhibited Amativeness by a quiet dignity of manner and called attention to the working of the instrument. Here Constructiveness was affected and deliberation set in.

In the phase of Deliberation I led from Constructiveness to Destructiveness when I showed the instrument's efficiency in destroying disease and the indestructibility of the instrument. Then I returned to Constructiveness again when I took the instrument apart. When I put it together again and handed it to the buyer it suggested Acquisitiveness. He Resolved to go further and ask the price.

When I named the price Calculation said "No," and

Combativeness was slightly aroused. I was prepared for Combativeness, so I continued with my argument in a manner calculated to inhibit Combativeness and excite wonder. I created wonder when I reverted to the superiority and indestructibility of my instrument and then saying that the argument was not convincing. Wonder springs from Spirituality. The faculty of Spirituality loves stories, so I presented the balance of my argument in the form of a narrative. The narrative was presented to Spirituality, but the suggestion it contained was aimed at Imitation. As I continued with my narrative and showed the success others were having with the instrument, Imitation was being influenced, which in turn influenced Acquisitiveness, and Desire set in.

While relating the narrative my voice, manner, and expression were in perfect harmony with the buyer.

My voice, manner, and expression contained an impressive sincerity that was constantly influencing the faculties of Imitation and Spirituality, and as I gradually showed how easy it was to sell the instrument, belief set in.

The faculties of Causality and Comparison were at work, but their workings were influenced by my involving the buyer by implication instead of presenting the argument to him directly. That is the secret of the power of indirect suggestion.

The selling talk I have just given is that of a single specialty. A general or specialty line is different, but the five phases of the will are the same. The motive

must be established by some particular article or articles, or by the line as a whole.

The individual items of a line are the selling points, and when it is necessary these items are resolved into their own selling points.

In all lines there are some numbers that are good, some that are bad, and some that are indifferent. They are made so by contrast.

Some salesmen lack self-confidence and arrange all their good numbers together for fear that the buyer will not be impressed otherwise.

This is a mistake, for the good numbers are thrown into competition with each other and the strength of the line is reduced.

If the salesman will distribute his good numbers among the bad and indifferent, all of his good numbers will be shown to good advantage by Contrast, and his bills will be larger.

There is also a difference of opinion among buyers as to what they can use. Some of the bad and indifferent numbers may appeal to them. But this can never be the case when a salesman concentrates all his selling talk upon the good numbers and overwhelms the balance of the line by their superiority.

There is another thing to be taken into consideration by salesmen selling a line for a manufacturer. A manufacturer can make his goods at a smaller expense and make better deliveries when he has less numbers to manufacture. It is therefore to the salesman's, buyer's, and

manufacturer's interest for the salesman to tactfully guide the buyer's selections when the line is large.

There is an observation I wish to make regarding salesmen and their lines. I have known many salesmen to make a success of a reasonably good line, but when they dropped that line and took a better one they failed. The reason for their failure is this: They were overcome by the superiority of the line. They thought that the buyers would be impressed in the same manner as they were. In fact they forgot their salesmanship. They forgot that they were dealing with the five senses and the different faculties of the brain. They forgot that each mind has an opinion of its own, and that the business of the salesman is to influence opinion, not so much by the goods themselves as in the manner in which the salesman presents them.

Furthermore a salesman is not always a competent judge of a line. He is often influenced by the opinions of others.

It cannot be denied that there are some lines superior to others, but they generally have their drawbacks, some of which are as follows:

They sell so easily that there is not much money in it for the salesman.

The manufacturer or jobber is unable to make prompt deliveries or fill all their orders. The customers become dissatisfied and cancel orders. If the salesman is selling on commission he has done much work for nothing.

The manufacturer or jobber with the superior line is

very often too independent, and loses customers for the salesman by their unwillingness to arbitrate differences that may arise.

The salesman is treated as an incident, not as a factor, in the business. Such a position is not calculated to build a strong character. There is not enough responsibility. Be careful before you make a change. Do not be influenced by the opinions of others. Rather improve what you have by finding out its weak points and suggesting improvements to your employer. But remember that all your points are not weak.

In closing this chapter there is one thing that should be impressed upon the mind, and that is to refrain from telling one's business to others. The salesman may have made a large sale and is so happy over it that he can hardly refrain from mentioning his success to others. Should it reach the ears of one of his competitors, his attention is directed to the possibility of selling this same customer, and he will strive to secure the business himself.

Or it may be that the salesman has some articles in his line that are having an enormous sale, and by boasting of these articles he directs his competitors' attention toward getting some of that business by copying or imitating them, and the salesman's monopoly on his good things is gone.

Then, again, it is decidedly unwise to tell anyone your business, especially competitors, for from that very moment you have placed yourself in their power to take advantage of what may appear to you to be a sure thing.

THE SALESMAN.

A bull-frog cannot sing like a nightingale, no matter how much you cultivate his voice.

Nor can you make a silk purse out of a pig's ear. The poor salesman is like the pig's ear—the animal fiber is there, but no process has ever yet been invented that will transform pig bristles into silk.

Nor has there ever been a process invented that will make a poor salesman who says "I can't" or "It can't be done" say "I will" or "It can be done" when the accomplishment of the thing devolves upon the poor salesman's ingenuity, resourcefulness, and action.

Had Lincoln said to himself, "A poor, ignorant backwoods boy can never hope to become a great man," the history of this country would be different than it is today. The poor salesman has the same brain, nerves, and blood as the good salesman, but he has never aroused a desire strong enough to impel him to unyielding action. There are three elements that enter into the character of a salesman.

These are Activity, Emotion, and Intellect.

According to his intellectual ability, the quality of his

emotions, and the amount of his activity, is a salesman good or bad.

There are two kinds of salesmen, the One-Method and the Versatile.

The One-Method salesman is long on Activity and Emotion, and short on Intellect. His activities and emotions are not properly directed. This salesman is generally overcome by the goods or proposition he is selling.

There is another kind of One-Method salesman who is all Activity and decidedly short on Emotion and Intellect. This is the salesman who works much but produces little results.

I do not take into consideration the salesman who is short on all three of the elements, for he is no salesman at all. The extremely Versatile salesman is long on Intellect and Emotion. His Activity is fitful and he lacks application. This is the wonder-worker. He is so emotionally and intellectually developed that he is able to change from mood to mood, emotion to emotion, and thought to thought, with the facility of a moving picture. He is so finely attuned that he senses advantage or danger far in the distance of an argument, and when danger threatens turns down the path of security and evades the peril ahead. One moment he is grave, the next gay; another moment he is convincingly firm, the next diplomatically yielding. Another moment he is outpouring a perfect torrent of argument, the next he is so persuasively soft and low that he thrills his hearer with a pleasurable emotion.

But this salesman is his own enemy for when he con-

siders that he has done enough business his thoughts fly to the present, and present pleasures. His gains are as evanescent as the vapors of the morn.

The best salesman of all is the one who is nearly evenly developed. He has a good intellect. His emotions have not been allowed to become blasé, and he is a steady worker. He is not as brilliant as the extremely versatile salesman, nor do his orders come as easily; but when they do come he appreciates them, and is spurred on by success instead of becoming satisfied.

There is another type of salesman and that is the old salesman who is doing business with old-time friends. He makes little or no effort to gain new business. The first salesman needs development of Intellect. The second needs development of Intellect and Emotion. The third, or as I called him, the no salesman, needs an overpowering desire.

The fourth needs to properly direct and sustain his will. The fifth can be greatly benefited by developing and systematizing his knowledge, and by trying to perfect himself. But absolute perfection is impossible.

The sixth is set in his ways and does not wish to change. The way to develop the Intellect is by systematic study. Plan out what you wish to learn. Then go ahead and learn it.

To develop Emotion read stories of kindness and suffering. Throw yourself into sympathy with the subject.

Read stirring tales of adventure, love, and ambition.

Give free rein to your imagination.

Go to your room, walk up and down, stir your blood

into action, work up your imagination, and put yourself in the place of a conqueror.

This may sound foolish to some, but you can take it or leave it.

Remember, however, that you deal with emotional buyers as well as with the intellectual, and your ability to create emotion in the buyer lies in the ability to arouse emotion in yourself.

Activity lies in the Will.

To develop, strengthen and direct your will, you must handle yourselves like you do a buyer. That is, you must turn the selling process upon yourself. You must first furnish yourself with a motive. Then deliberate upon the motive and ask yourself if it is worth while to attain or accomplish it. You resolve that it is and decide to go further. You then arouse a desire in yourself to attain or accomplish the motive. This you do by becoming dissatisfied with what you have, or are, and by longing or wishing to become what you are not, or to attain what you have not.

When you have aroused desire, go over your plan of action and see what obstacles will be in your path. Consider if you are strong enough to overcome them. If you decide in the affirmative, you have created belief, and this belief should be so strengthened that no power under heaven can change it.

If you decide that you are not strong enough, your will is Evocative; it is still dormant, and needs calling forth. Your desire has not been powerful enough. Put a lazy man fifty miles out on a desert, where he will be

unable to obtain anything to eat, and when he gets hungry he will have a powerful desire to get back home. He will do so.

His motive is necessity, but that is a coward's motive.

A strong man will brave necessity—court it even—to attain or accomplish his purpose.

Furthermore, necessity is not a sustaining motive, for when the necessity is overcome the will becomes passive again. There is no longer a motive. But necessity is a good motive, for this reason—it evokes the will, exercises it, and gives it strength for the time being. When the necessity is overcome, the will can easily be sustained by furnishing it with a new motive.

If the will feels unequal to the task of attaining or accomplishing the motive, desire must be so intensified that all the ingenuity and resourcefulness in the man will unite in evolving his dormant power to remove the obstacles from his path.

As each obstacle is removed, his belief in himself will grow, until at last he becomes firm as a rock, and nothing but dynamite will move him.

Where the will is in action but wrongly directed, it must be reversed.

The man must use an inhibiting idea, supply himself with a motive, deliberate, resolve to go further, arouse desire, and establish belief.

It is a common mistake to call men who drink heavily weak-willed, for they are not. Their will is strong but wrongly directed.

A man will work all week to obtain the money for one night's carouse. His motive is drink.

The man who has received his money and decides to take one drink and then go home, but gets drunk instead, has directed his will wrongly from the start. His intention was good but the one drink inhibited his will and turned it in the wrong direction.

He supplied himself with the motive. He then deliberated and resolved to have one more, then another, until such a desire was created for what he had not that he formed the belief that he wanted everything in sight. One drink to some men is like the taste of blood to a lion—it calls for more.

Other men can take one drink and stop right there. They treat it as an incident, not as a motive. But continued incidents lead to a motive, so beware. The desire to drink springs from the faculty of Alimentiveness, and its strongest inhibiting agent lies in that faculty.

The desire to eat and drink comes from the same faculty. It craves something and must be satisfied. When you have a desire to drink do not do so, but eat instead. The craving will then be gone.

A man who does not drink before a hearty meal will not wish to do so after eating, unless he cultivates the habit. This habit is easily broken off by a little self-restraint, for it is only when the stomach is empty that drink gains a strong hold upon a man.

We would all like to have a strong personality, but few possess it.

You can develop your personality by taking thought—

deep thought. As a man thinks, so is his manner, expression, voice, and actions.

If a man's thoughts are tricky, so will his expression be. If they are kind, good, and honest, his face will express it. A man who constantly and deeply studies his development, his welfare, and the welfare of others, molds his expression so that when the eyes rest upon his face, they are held there and attention is spontaneously given. The intellect behind the expression intensifies that attention, and the hearer feels that he is listening to a man who knows. He is inclined to place confidence in what he hears.

Remember, that when a buyer places confidence in you, the confidence in himself is weakened in proportion to the amount given.

Without honesty you cannot gain lasting confidence, no matter what your knowledge may be. Be honest with yourself, your house, and your customer. Your house will show its appreciation by a raise in salary, provided you do the business. Your customer will continue to give you his business, and as for yourself, you can look the whole world in the face and fear no man.

SCIENCE AND ART.

Science is a creation of the Intellect—Art a creation of the emotions. Science appeals to the Intellect—Art appeals to the emotions. Art is the application of Science—so is Art the application of an inspiration engendered by the emotions. Art bends human nature to its will, and Science is its means.

SELLING GOODS BY CORRESPONDENCE.

The Mail Order Business.

The great advantage which selling goods by mail has over other methods is that it is never subjected to unfair competition. The machinery of the postoffice department will carry the goods of the small dealer just as cheaply as it will carry the goods of the greatest houses.

That business experience and capital are not absolutely necessary in order to make a success of the mail order business is proved by the experience of an Ohio farmer 67 years old, who started in with a capital of only $400 and in eighteen months cleared $25,000.

Colossal fortunes have been made from the business with spectacular rapidity, and men and women with no capital but an idea are still becoming rich by selling goods through the mail. The opportunities are as great as they ever were, and will be still greater tomorrow. The principle of its success is the ability to create the impression that the seller by mail is able to deliver to the person in the out-of-the-way town or place in the country a something that is better and cheaper than the people near such a town can buy in the home market.

Certain ideas have become accepted as vital in the founding of a successful mail order business, and these ideas have been embraced in a few general rules, as follows:

Rules for Successfully Conducting the Mail Order Business.

First.—Go slowly. Don't decide to embark upon a mail order career and then resign your present position without knowing definitely in what direction you are going to work. A few weeks of quiet consideration and planning won't do any harm. As much depends upon the *plan* of selling as upon the *article* to be sold.

Second.—Choose carefully a "leader" or article upon which you will base your main campaign and upon which you can get all the profit. To do this, unless you are already the possessor of an exclusive idea, run carefully over the entire list of what people wear, eat, drink, or need from the cradle to the grave. Nothing is too small or too large to be included in this vast catalogue, and your eventual choice will probably come in a flash of inspiration. Try to get something that the great houses can't get. Today the field of the mail order business is commanded by the person who has a specialty which is strong enough in demand by the people, and over which specialty the mail order dealer has an absolute control.

Third.—Having chosen your leader, investigate carefully the price at which you will be able to offer it to successfully compete with other similar articles. Be sure

that you can sell it through the mails cheaply enough to meet competition.

Fourth.—Do not be content with a single leader. Get from supply houses a number of specialties, and inclose circulars for them in all your letters. Any orders thus gained cost merely the 2-cent stamp that carries the bait.

Best Things to Sell.

In the opinion of an expert student of the mail order field there are three general lines along which the beginner in the business must work. First in order would be an invention of general use—the kind of thing that every family seeing it would want, and which as an invention would be within the control of the house selling it. Second in value is some patent medicine, applicable to common ills, and which will do all that the advertiser may claim for it. And third in the rank of possibilities for a new business of the kind is a new and striking scheme adapted to some overlooked chances, perhaps. For instance, this last possibility in the mail order business may be illustrated in the fact that one of the great real estate concerns of the east is conducted along mail order lines. It was a novelty in the real estate world, but with the ideas of the men behind it the whole scheme has been made to go.

Fifth.—Plan your advertising. Consultation with an expert is a safe precaution, as an advertising man possesses experience that will be valuable to you, even if you are brilliant enough to successfully word your own advertise-

ment. A good plan is to take some article that presents points of attractiveness and advertise it at a price which is strikingly lower than the same kind of an article can be bought for at the local store. Your ad should contain an offer to send your catalogue free, so that while the article advertised may not be purchased, the reader of the ad may be interested enough to send a request for the catalogue.

There is no better means for exploiting the mail order business than is afforded by the small advertisement in a newspaper of sound circulation. Beyond any doubt the small beginner in the mail order business can thus put his wares before the public at a cheaper rate and with quicker returns than through any other medium.

To bring returns your ad should state as directly, simply and convincingly as possible the reason why the reader should buy your article. If from your description he is satisfied that it is just the thing he wants, the all-powerful reason *price* will do the rest.

Sixth.—As a general rule, one-fifth of a small capital is not too much to expend in experimenting. When you begin to get results resign your position, devote your whole time to your new business, and develop it economically and judiciously upon the lines originally decided upon.

Correspondence.

When in response to your ad you receive letters requesting descriptive matter and other particulars regarding the article advertised, you should proceed to work up sales through correspondence.

When one considers the vast amount of advertising done, realizes that the cleverest advertisement can only bring inquiries, and that business which is to accrue depends upon letters, the necessity of a clever letter writer at the helm will be understood.

Every line of business operated today employs one or more competent correspondents, who are in the confidence of the firm and draw salaries that rank them well up among the best paid employees. The ability to write a good business letter is stock in trade on which any man may well put a high valuation.

Distinction, however, must be made between a well written letter from a standpoint of correct English and of business pulling capacity. Many a college man in command of perfect English could not handle a large correspondence as successfully as a business man who has a heart interest in the matter.

These elements must enter in: A correct handling of the English language, perfect understanding of the business at hand and a practical knowledge of human nature. A professional correspondent has a regular system in conducting a large correspondence. He has, in the first place, his "follow up letters," carefully prepared, each one the result of thought and painstaking pruning. No literary worker gives more attention to the small details of his composition than the correspondent gives to each of his letters. He arranges the whole system with geometrical exactness as to its component parts, a certain proportion proposition and a certain proportion argument, varying with each letter from first to last. These

letters are written and rewritten, pruned and repruned, until the correspondent is satisfied they contain strong argument arranged in order to be most impressive.

Then he makes notes on different points or objections that arise or are likely to do so, and answers each of these points in paragraphs couched in the cleverest and most convincing language. These paragraphs are numbered and kept for ready reference. When an inquiry comes in that is already answered in the "stock book" the correspondent has only to refer the stenographer to the prepared paragraph and add the individualizing touch. In this way the correspondent who handles 200 or 300 letters a day can do so with perfect satisfaction to each patron, never hurrying a letter, never omitting an important point, and, at the same time, not overtaxing himself. A great many letters require individual attention, and it is that the correspondent may handle these in the most satisfactory manner that he should have his stock book ready to handle all ordinary cases. It is a great drain to dictate a large number of letters, and the human brain will lag, the right words refuse to come, if all the helps possible are not resorted to.

The Follow-Up System.

In case there is no acknowledgment of the receipt of catalogue or reply to the letter transmitting it, a series of follow-up letters should be resorted to. The following letters are presented as a good illustration of the follow-up system:

LETTER No. 1.

Dear Sir: We beg to remind you that we have not received your response to our letter regarding the "Perfection Gas Heater."

Feeling sure that your inquiry was made because you were interested, we believe your failure to respond was purely an oversight.

Do you desire further particulars?

That the "Perfection Gas Heater" is the best article of the kind in the market is proved by the enclosed endorsements. The price cannot be paralleled.

Trusting we shall receive an early response, and assuring you that in case of your ordering the heater, if you do not find it just as represented you may return same at our expense, and we will cheerfully refund the purchase money, we remain,

Very truly yours,

LETTER No. 2.

Dear Sir: We have not yet received any word from you since we complied with your request for our circular and catalogue, but we still think you must be interested in the matter of getting one of our unequalled "Perfection Gas Heaters." There is nothing else that can take its place, and those who have purchased one wonder how they ever got along without it. You will excuse our friendly persistence, but we know that when we have secured your order we have acquired not only a patron but a champion, whose influence will surely bring us ad-

ditional orders. Our proposition is to send you the Heater on receipt of the price and to refund the purchase money on return of same at our expense any time within thirty days if not found entirely satisfactory.

Expecting an early response from you, we remain,

Very truly yours,

LETTER NO. 3.

Dear Sir: We have not as yet received any response to our letters notifying you of our compliance with your request for catalogue and circulars. You doubtless have read the numerous emphatic endorsements of our "Perfection Gas Heater" by patrons who have used it (if not, we will send you others on request), and we cannot but believe that you are interested in securing one. We do not want you to forget it and us in the rush of other matters. We believe your inquiry was made in good faith, else we would not have gone to the expense of forwarding our printed matter. Our records thus far show no response of any sort from you. The days are getting shorter, the evening hours are getting chillier, and your health and comfort demand that you have a little artificial heat in the home for a few minutes every day. If you have made up your mind that you are not going to act upon our favorable proposition to secure one of the quick-action "Perfection Gas Heaters," which supplies warmth and good cheer on tap for a minute, an hour, or a day, won't you be good enough to let us know the fact, so that we may save further expense to ourselves and trouble to you in posting you regarding it?

As a matter of fair-dealing we are entitled to some kind of a reply.

Very truly yours,

The foregoing letters show the spirit in which follow-up letters should be couched, but, of course, different articles require different arguments in order to make the sale.

The follow-up letter should never be impertinent or show resentment because your letters are not answered or your articles purchased. Wheedling goes a great way in effecting a sale, while nagging almost always drives off a customer.

Never misrepresent any article you have for sale. The days of the "fake" mail business are over. The laws punishing offenders for using the mails to defraud the public or to obtain money under false pretenses are very strict and severe. Every now and then a swindle is brought to light, but the government is stern in ferreting out and suppressing such enterprises. It was the government that gave the mail order business its first great impetus by reducing the rate of postage, and it is the government that has doubled the total trade in the last few years by establishing the rural free delivery system.

PUNCTUATION

So much depends upon correct punctuation in business correspondence, that no treatise on salesmanship by letter would be complete without explicit information regarding it.

The purpose of punctuation is to show the relation of the words employed and thereby to clearly indicate the sense or meaning that is to be conveyed.

The principal points or marks in punctuation are: the comma (,), the semi-colon (;), the colon (:), the period (.), the interrogation point (?), the exclamation point (!), the dash (—), the parentheses ( ), the bracket [ ], and the quotation marks (" ").

The Comma is used (1) after an address: "James, come here;" (2) after certain introductory adverbs, as *however, at length, at last;* (3) preceding *which* or *who,* when introducing an explanatory clause: "Think no man poor, who has laid up treasures in heaven." When, however, the *which* or *who* is used in a restrictive sense, the comma should be omitted: "It is labor only *which* gives relish to pleasure"; (4) often used in place of *and:* "We first endure, then pity, then embrace; (5) to indicate contrast or opposition: "Not only in union *with,* but in opposition *to,* the views and conduct of one another;" (6) in a complex sentence, the dependent clause should be separated from the principal clause by a comma: "When our vices leave us, we flatter ourselves that we leave them."

The Semicolon is used (1) when two or more simple sentences are combined into one: "My friend rose at six o'clock; he breakfasted at nine; and at ten went out for a walk;" (2) When in a sentence complete in construction, a clause is added containing a reason, an

explanation, an inference, or a contrast, it generally should be preceded by a semicolon: "The past seems to promise it; but the fulfillment depends on the future."

The Colon is placed after such expressions as *in these words, the following, as follows*, either expressed or implied. It is also placed after *Dear Sir*, etc., and in reference to Scripture quotations, as Matt. 10 : 14.

The Period is placed (1) after a complete sentence that is not an exclamation or an interrogatory; (2) after abbreviations, as "M. D.," "Esq.," "Mr.," "Oct." (3) After Roman numerals, as "II.," "IV." (4) After a signature or date.

The Interrogation Point is placed after a question.

The Exclamation Point is placed after a word, expression, or sentence, denoting astonishment, emotion or command.

The Dash is used (1) where a sentence is left unfinished; (2) where there is a sudden turn or an abrupt transition; (3) where a significant pause is required. It is often employed in place of the parentheses.

Parentheses are used to enclose a word, phrase or remark which is merely incidental or explanatory, and which might be omitted without injury to the grammatical construction; as, "Know then the truth (enough for man to know).

The Brackets are used to enclose some explanatory remark or phrase; now used principally in dictionaries and other books of reference.

The Quotation Marks are used at the beginning and end of a phrase, clause, or sentence quoting the exact words of an author or speaker. When a quotation is included within another it is distinguished by a single inverted comma at the beginning and an apostrophe at the close.

Division into Paragraphs. — In letter-writing a proper division into paragraphs adds much to the ease of reading what is written. Commencing on a new line the transition to another branch of a subject is made to appear clearly. When a single subject occupies much space, the larger divisions of it should form separate paragraphs, each of these closing with sentiments of peculiar importance.

Buying Goods by Mail

When ordering goods by letter great care should be taken to give all essential particulars. If several items are ordered, the number and kind of each article should be stated. If there are different styles, sizes or qualities of any articles wanted, offered at different prices, the style, size or quality desired, together with the price, should be given. How the goods are to be sent should invariably be plainly stated, whether by freight, express, or mail. If by freight or express, the railroad or express company preferred should be named. If the goods are to be sent by mail, unless advertised to be sent postage prepaid, stamps should be enclosed to cover postage, or the amount included in the Postal Money Order, Express Money Order, or Chicago or New York draft.

The letter should be brief and explicit, but contain enough explanation to make perfectly plain what is required, and the address to which the goods are to be sent should be plainly and fully given.

When goods are to be sent C. O. D., and the parties are not known to the firm, it is always more satisfactory to furnish references—either your bank, or some responsible person in the town or neighborhood.

When shipment is to be made by freight, bill of lading attached to draft, collect, it is invariably more satisfactory to send part of the amount with the order, because, as a rule, it establishes confidence and thereby strengthens your credit. The balance of the amount should be paid promptly on the arrival of the goods, and it will also save storage charges.

The following forms of letters ordering goods may be readily adapted to any particular case, the signatures and orders used being fictitious, merely to show correct forms of complete letters:

Forms of Letters Ordering Goods.

Form No. 1.

Havana, Cuba, March 12, 1910.

Messrs. A. C. McClurg & Co.,
Chicago, Ill.

Gentlemen—Your new catalogue just received. Please send us cheapest way, at once:

2 doz.	Dustless blackboard erasers No. 2711
1 gross	XXX blackboard chalk, white
5 M	XXX high cut, all rag white envelopes, 6¾ size
1 gross	No. 9976 lead pencils
1 doz.	No. 7421 pencil erasers
3 doz.	No. A279 pen tablets, letter size
2 doz.	No. A281 pen tablets, note size
6 doz.	Laird & Lee's Webster's Modern Dictionary, Handy Edition, list 20c

2 doz. Laird & Lee's Vest-Pocket Webster Dictionary, leather, 25c.
½ doz. Standard Ice Cream Maker, $1.50
½ doz. Standard Guide for Locomotive Engineers and Firemen, 75c
2 doz. Standard Spanish Dictionary, leather, 50c

Very truly yours,

JONES & JACQUES.

No. 17 MAIN STREET,
NO. YAKIMA, WASH., Sept. 6, 1910.

The S. S. Gibson Co.,
Oakland, Cal.

Gentlemen: — Please send me copy of Parker's Laws of Business, bound in law canvas, on terms advertised by you in circular received today. If on examination I find the book satisfactory, I will remit $4.50 as payment in full: but if I do not find it as represented, will notify you to send stamps for its return. Truly yours,

R. B. MARTIN.

---

[3]

CHELSEA, VT., March 8, 1910,

Messrs. Laird & Lee,
263 Wabash Ave., Chicago, Ill.

Gentlemen: — Please send by Am. Express, prepaid, the following books:

1 Laird & Lee's Webster's New Standard Dictionary, High School and Collegiate Edition, ... $1.50

1 Standard Guide for Locomotive Engineers and Firemen, ...75

1 Standard Domestic Science Cook Book, leather (Gift Edition, in a box), . . 2.50

$4.75

I enclose money-order for $4.75 in payment for above, which please forward at once as directed.

Very truly yours,

JAMES ROBINSON.

---

[4]

POTTSTOWN, PA., April 3, 1910.

Messrs. Marshall Field & Co.,
Chicago, Ill.

Gentlemen: — Please send the following goods by express:

1 pair ladies' No. 6 pique kid street gloves, $2.00

2 ladies' white lace-edged linen handkerchiefs, best you have at about 85c each;

3 white jet-trimmed jabots, your best values at about $1.00 each.

I enclose money-order for $10.00, and ask that you will please prepay express charges out of balance, and credit me with remainder, pending another order or instructions to return the amount.

Very truly yours,

(Miss) ETHEL THAYER.

[5]

436 Oak Street,
Bloomington, Nev., Jan. 9, 1910.

Messrs. Montgomery Ward & Co.
Chicago, Ill,

Gentlemen:—Please send to my address cheapest way, the following:

1 Crown Jewel Oil Heater, ...	$3.50
1 Pony Premo No. 1 Camera, size picture 4x5 inches, ...	10.80
	$14.30

I enclose money-order for $14.30, and ask that you kindly send goods as soon as possible.

Truly yours,
James A. Smith.

---

[6]

Butte, Mont., Feb. 21, 1910.

Messrs. Sears, Roebuck & Co.,
Chicago, Ill.

Gentlemen— Please forward by cheapest way at once,

1 No. 7682 saddle, ...	$36.25
1 No. 2167 bridle, ...	7.15
	$43.40

I enclose Chicago draft for the amount, $43.40. Kindly ship promptly and oblige,

Yours very respectfully,
Ike Thomas.
Care Benton's Hardware Store.

HOW TO WIN.

What is the prime requisite of success? It can be told in one word—Faith.

It is first necessary that a salesman should have faith in the proposition and in the goods he is selling. Second, he must have an invincible faith in himself if he hopes to win unqualified success.

The salesman who starts out with a line in a half-hearted way, or starts out with the intention of simply trying out the line to see if it will sell is doomed to failure at the start, because he lacks the positive quality of Faith—Faith in the goods, and Faith in his ability to sell them.

Faith in your goods springs primarily from faith in the firm or individual for whom you are working. And it should not be the simple faith that is founded on blind confidence, but the faith that is the result of analysis and absolute knowledge.

A salesman should make sure that those for whom he is working are of unimpeachable integrity; that the things they have to sell will be a benefit or an advantage to the purchaser; and that the firm or individual is in a position to carry out whatever they agree to do.

When the salesman is satisfied on these three points, he has the basis of a confidence that should be absolute and unshakable.

Remember this: No one concern has the best line at the lowest prices. If this were possible, the concern producing the articles could get all the capital it would need to make goods for the entire country and drive every one else out of business.

Experienced merchants do not expect to be always buying the best goods at the lowest prices. They know that certainty on that point is impossible. All they wish to be sure of is that they are buying reliable goods that they can sell at a profit.

Nine-tenths of the salesmen traveling around the country are constantly making the assertion, "I have the best line on earth," and wonder why the assertion carries no conviction to the merchant. They do not realize that the psychological value of the word "best" is practically nil, and in many cases absolutely negative.

In the first place, the word has been so overworked that it produces no effect. In the second place, it is only a broad generality; there is nothing specific or definite about it, and is therefore incapable of exciting any inducement or desire to buy.

Get away from the idea that you must convince a buyer that you have the best line on earth. Instead, you must remember that the merchant's motive for starting in business was to make money—not merely to handle the best goods. You have something in your line that will make money for the merchant; show it to him from

his standpoint and you will have his immediate interest. After you have sold a merchant one order you will find it easier to sell him again.

Remember always: You must have faith in your goods.

Faith in Yourself.

While it is of the utmost importance that a salesman should have faith in his goods, it is equally as important that he should have faith in himself. This faith should spring from a strong character, otherwise it is nothing more than an empty conceit that is liable to embarrassment and discomfiture at any moment.

A strong character is only formed by cultivating Self-Control, Self-Confidence, and Poise, and eliminating Doubt and Fear.

Self-Control.

To cultivate self-control, a salesman must learn to restrain his impulses. Not only such impulses as anger, impatience, intolerance, indiscreet excitement, etc., but also the impulse that leads to injudicious remarks which may at the moment seem a happy inspiration, but which in reality endanger the success of the sale.

In many cases there are certain things that should be suppressed, or not touched upon, and it often requires as much tact and judgment to suppress or avoid detrimental ideas as it does to express those that are essential.

Tact and judgment are inseparable, and self-control is highly necessary to both.

Self-Confidence.

Self-confidence is indispensable to success in salesmanship. Not the brazen, obtrusive, antagonistic self-confidence that steels a buyer's mind against such a bearing, and creates dislike, but the calm, unconscious self-confidence that creates respect and conveys the impression that you are representing a proposition that is worthy of consideration.

Self-confidence engenders self-reliance, and it is needless to say that without self-reliance a salesman can never succeed.

Self-confidence is a positive power, and is the result of knowing oneself, his ability, his deficiencies, and overcoming or supplying those deficiencies; otherwise it is nothing more than mere self-assurance, or self-delusion. Don't yield to that human pest, FEAR.

Poise.

Poise is the armor of the mind. It turns off adverse suggestions or arguments with the ease of the skilled fencer who parries a thrust.

Poise suspends judgment long enough to subject a doubt to analysis, but the mental balance is not disturbed.

Poise is proof against embarrassment and disconcertion. It gives the power to neutralize inimical ideas by a calm suggestion that turns an argument into another variation and changes the aspect of things. Forceful opposition is by this means turned into doubt.

The secret of poise lies in concentration, self-possession, and in knowing your proposition so thoroughly that you can talk it backward or forward, and both ways from the middle, so that it requires no mental exertion to combat opposition. The ideas necessary to neutralize or influence should come spontaneously, so that the mind is allowed to concentrate itself upon the one idea: "You should have my goods."

This mental attitude will be a positive factor in helping you to make sales, and establish friendships.

Eliminating Doubt and Fear.

There is not a salesman living who has not been worried by doubt and dismayed by fear in one form or another.

Doubt is a precursor of fear. It commences in hesitation or indecision, and, unless the antidote of successful analysis is applied, enervating fear ensues. With fear in the ascendency, success is impossible.

Auto-suggestion is constantly being recommended as a cure for fear. This means that if a man repeats to himself: "I am not afraid—I am courageous," and pictures himself as being courageous in action, he will come to feel that he is not afraid.

This is very good as far as it goes, but it does not go far enough. It can only be an aid, or a palliative, but not a positive cure. Let us tell you why:

Fear is caused by ignorance. In order to cure a disease, or an evil, it is necessary to remove or destroy the

cause. True knowledge is the only destroyer of ignorance.

Let us illustrate: A child tries to open an oven door with its bare hand. The door is very hot and the child is burned. Thereafter the child is afraid to touch the oven door until it learns that by protecting its hand with a cloth it can open the door without being burned. When it learns this, it has gained knowledge, and the knowledge has killed the ignorance. The child is no longer afraid.

Again: A salesman is asked to solicit the business of a man of large affairs. The salesman doubts his ability to sell the man. He says to himself: "This man knows more about the business than I do." The fear of failure grips him. He determines, however, to make the attempt, but is worsted. After leaving the man he analyzes the situation, and finally sees where he has made a mistake, or how he can overcome the objections that have been raised. He has learned something and is no longer afraid. He returns full of confidence and shows the man where they have both overlooked the true state of affairs. The man sees that it is to his advantage to deal with the salesman, and places his order.

Had the salesman allowed his fear to deter him from making the attempt, he would have remained unenlightened; the sale would not have been made, and ignorance would have been the cause of it all.

When a salesman learns that the most fatal consequence of failing to make a sale is a gaining of knowledge, he will no longer be afraid.

The Motive Power.

The motive power that drives men to success is derived from Ambition, Enthusiasm, and Determination.

True ambition incites a salesman to action; it will not allow him to remain inactive.

Enthusiasm gives a salesman a genuine liking for his work, and without a genuine liking for his occupation no salesman can succeed.

Determination gives a salesman the tenacity of purpose—the stick-to-itiveness—that is necessary to accomplish anything that is worth while.

Many a general on the battlefield has been whipped, but he did not let himself or his men know it, and in the end has won great victories. The salesman who can cope with the most discouraging conditions many times wins the greatest success.

(A few of the following lines may give offense to some of our readers. If so, we shall be glad for their sake. Some men must be stung to the quick before they can be impelled to action.)

The salesman without ambition is figuratively the tramp of the business world. The tramp gives no thought to the future—he is always living in the ever-present now. He has chosen the profession of tramping because it is the easiest way of existing until he is claimed by the Potter's Field. Work to him is a natural evil; it causes pain, distress, and is a calamity. Thought to him is a moral evil, for it is unjust to make men think. He is lazy—both physically and mentally.

The salesman who is physically and mentally lazy chose the profession of salesmanship because it appealed to him as an easy path to success, entailing but little work, requiring no brains, and affording him the pleasures and comforts of life with the least possible effort. He no doubt had ambition when he aspired to become a salesman, but when his aspiration was realized his ambition died an ignoble death.

No salesman who is devoid of ambition can ever hope to attain permanent success. Through a happy combination of circumstances he may prosper for a while, but when the circumstances that have favored him are altered he is necessarily doomed to failure, for he lacks the qualities that sustain the salesman urged on by ambition.

Self-satisfaction, Indifference, and Resignation are three great foes to Ambition and Success.

Self-satisfaction causes a man to lean back in his chair and say: "I have done well enough for a while, and now I'll take a rest."

This is going backward, for you must either progress or suffer retrogression; there is no standing still. Furthermore, a frequent repetition of this resting will engender a love of ease that will be hard to overcome.

Indifference leads to carelessness, and carelessness is heedless of consequences. When you disregard consequences you are rendering your judgment worthless.

A salesman must constantly exercise his judgment, otherwise he will do or say something that will prove fatal to him.

Resignation is the harbinger or acknowledgment of

defeat. To resign yourself to circumstances is an admission of a broken spirit. Once your spirit is broken, your chances for success are almost hopeless. There are very few who have been able to regenerate themselves after yielding to the enervating influence of resignation.

When you feel yourself slipping backward to resignation, then comes the supreme test of your character. Then is the time when you determine whether you are a weakling and are ready to join the down and out class, or whether you have the power within you that has been lying dormant through neglect, and are able to arouse that power to a pitch of sublime courage that arises and says to failure when it calls to claim you for its own: "No! I do not belong to you. Even though you have loaned me fear, discouragement, and depression, I did not bargain to pay my soul in usury. Here! take them back. I want them no longer, but I defy you to collect your usury."

There is a courage that is born of desperation that has pulled many a man from the very jaws of failure. It seems to lash every idle faculty into action and generates a power that is almost irresistible. These men were indifferent to the power that lay within them until they were absolutely forced to exert it. Would it not have been better to have cultivated and used this power during the time they were on the road to failure? Much time would have been saved and they would consequently be farther ahead. The reason in many cases lies in the lack of genuine ambition.

Men of genuine ambition are not plentiful. The ma-

jority of men are only half ambitious; that is, they have a desire for wealth; they have a desire to be somebody, but they lack activity—activity of both mind and body.

The genuinely ambitious salesman is constantly and always thinking; studying when he has a chance, and seeking knowledge that will aid him in his business. He has an unalterable belief in his ultimate success, and works to that end.

In closing on this subject, we would warn the salesman against self-indulgence. It leads to a love of ease and ends in idleness and dissatisfaction with one's self.

Originality and Resourcefulness.

The value of originality lies in its power to hold attention and create thought. It invests a subject with a new character and therefore gives it a novelty that charms the imagination.

There is nothing wonderful about originality; its secret lies in knowing how to combine two or more old ideas, or things, that will form something new.

To be a creator of original ideas it is necessary to acquire knowledge, and then digest it. After you have digested that knowledge, the ideas that constitute it become part of yourself, and the balance merely lies in fitting your different ideas together as you would a jig-saw puzzle. That is all there is to originality.

Resourcefulness is fertility in expedients. In order to become resourceful, it is necessary to have a fund of ideas that you can draw upon, and use, instantaneously.

This will give you the ability to overcome or circumvent obstacles that would otherwise overwhelm you.

Originality, Ingenuity, and Resourcefulness are closely allied. They all come from the same source; namely, the ability to combine ideas.

Learn to combine your ideas.

When accepting a position be careful to observe the rules.

If smoking, chewing tobacco, using profane language or chewing gum is not allowed in the establishment it is important that you yourself should live up to the requirements.

Be temperate, truthful and persevering, because this is a lasting asset that is sure to count in your favor.

Whenever you can set a helpful example for others don't miss the opportunity. While the proprietor or manager may not at the time seem to notice you, remember the trained business eye most always sees what's going on, and the day may come when you may be advanced to a higher position as leader while others will be still lagging behind as followers.

THE RETAIL SALESMAN.

While there is a difference between selling at wholesale and selling at retail, it must be understood that the principles of salesmanship are the same in both. The principles outlined in the preceding pages are applicable to the retail business as well as the wholesale.

The main difference between the retail and wholesale salesman lies in the fact that the retail salesman waits for customers to come into the store, whereas the wholesale salesman must go out and make customers. But after customer and salesman are brought together there is as a rule practically no difference; the mental process is the same whether you are selling one shirt at retail or ten dozen at wholesale.

The retail salesman, as well as the wholesale salesman, must have a genuine liking for his work. It is, in fact, the only road to success.

No employer likes to have a salesman who regards his work as a hardship. He knows that the salesman will be indifferent toward his customers, and careless of his stock. He knows that the salesman will hurry through everything so that he may be alone with his oppressive brooding and discontent.

Probably the first question an employer should ask a salesman applying for a position is whether he likes his calling, and then judge his man from the manner in which he answers.

A strong liking for his work is the anchor that holds a man to his job. When it is necessary to lay off some of the force of salesmen, this man remains, while those who are indifferent to their work are usually laid off.

Many salesmen overlook the opportunities that the field of retail merchandising affords. First: It gives an opportunity of learning business methods. Second: It gives an opportunity of learning merchandise. Third: It gives an opportunity for studying human nature in the act of spending money.

These three things are invaluable to the retail salesman who is saving money to start in business for himself. He is enabled, through the knowledge and experience he acquires, to avoid many mistakes that would otherwise cost him very dearly were he to start in business without experience.

Again, a salesman has an opportunity of becoming a buyer, superintendent, assistant manager, manager, or head of some of the various departments in a large establishment. In a small establishment there is a possibility of being taken in as a partner.

Furthermore, it should not be understood that the pay of the retail salesman is always small. There are many salesmen in the larger cities making from twenty-five to sixty dollars per week. They are men who have improved their opportunities.

To the retail salesman who is desirous of becoming a traveling salesman it may be said that some of the best traveling salesmen were retail salesmen before they started on the road.

There is one thing that a salesman should see in the proper light, and that is, his employer has paid good money for every article he has in stock. It is therefore the salesman's duty to keep the stock entrusted to his care in a clean and undamaged condition. Otherwise the loss incurred through damaged goods will eat up much of the profit that is made on other goods. It is hard enough to buy the right goods, without the additional handicap of having them damaged. The salesman cannot be loyal to his employer if he allows his goods to become damaged.

In keeping stock a salesman should have a system whereby he can lay his hands on any article at a moment's notice. The stock can be kept according to price, size, color, style, or according to any peculiarity or dissimilarity that differentiates one thing from another.

Your stock should be kept in such a manner that, if you were to be detained from business for a time, another man could step into your stock and become familiar with it in a short while.

Some men are so small and petty-minded that they imagine that they have a hold upon their employer by keeping their stock in such a manner that only they themselves can find the articles wanted.

The salesman should get that idea out of his head immediately. No employer will allow himself to be

coerced in such a manner. He will simply wait for an opportunity to discharge such salesman, and his recommendation to another place may not be of the best.

As to knowing the goods and prices he is handling, a salesman should learn all that he possibly can. His knowledge is his stock in trade; it is the ladder by which he climbs higher and still higher.

The story of how a young dry goods salesman rose to the position of buyer in a few years through knowledge will illustrate this point. This salesman was employed in a piece goods department of a dry goods store in a large city. One day the salesman was requested by the buyer to bring him samples of all the fancy woven goods he had in stock. That means that the colors are dyed in the yarn before they are woven. Among the samples brought to the buyer was one that was printed on both sides in close imitation of woven goods. When the buyer saw this sample he picked it up and tossed it to the salesman, saying, "I don't want that; it's not woven, you 'know-nothing.'" The salesman picked up the sample, pulled out a few threads and saw that it was printed. Right then and there he resolved never again to deserve the name of "know-nothing."

That evening he went to the public library and secured a dry goods dictionary. From this dictionary he learned the names of the different materials. During his lunch hours he would go to different stores and get samples of materials he wished to know about. He secured samples of the same materials at different prices from all

the big stores. He then compared them and in this way was able to learn much regarding values.

He then took up the study of textiles; learned the difference between woven, knitted, and felted goods, and how they were manufactured. He learned about bleaching, dyeing, printing, and how patterns are extracted from goods dyed in the piece. He learned the difference between vegetable and animal fibres, and how they were combined in manufacture. In fact, within a few months he acquired a mass of knowledge that he might never have gained through actual experience.

He then set to work to put this knowledge to use. Going to the different stores that handled the same goods as his department, he secured samples which he compared with the goods in his stock. He saw that some of the stores were selling goods that could be handled to advantage in his department, and suggested this to the buyer.

It was quite a surprise to the buyer to see the "know-nothing" making suggestions to him, but he saw that the young man was right. To probe the depth of the young man's knowledge, the buyer asked him several questions, which were answered promptly and correctly. The buyer said nothing at the time, but simply thanked the young man for his suggestions.

Not long afterward the buyer's assistant was discharged and the young man was promoted to the position of assistant buyer. Some years later the buyer was offered a position at a larger salary by a concern in another city, which he deemed advisable to accept. When

tendering his resignation, the buyer recommended the young man whom he had called a "know-nothing" as his successor. The management, who had been keeping a watch on the young man for some time, decided that he was fit to fill the position, and he was made a buyer.

The foregoing illustration contrasts strikingly with the indifferent and careless salesmen we meet daily in any retail establishment, small or large. Many of them are constantly drifting about from place to place; always dissatisfied, but their dissatisfaction is not of the kind that fills them with an ambition to learn more, earn more, and be somebody.

The salesman whose services are confined to a single department has the opportunity of becoming a specialist in his line, while the man who sells various lines has an opportunity of gaining a wider scope of knowledge that will enable him to get a position at any time he may need it. To the latter, however, it should be said that it is best to know one line well and the balance as well as you can. It is the specialist who makes the most money nowadays.

Regarding a salesman and his customer, it should be said that a salesman cannot treat all customers in the same manner; but there is a manner that a salesman will do well to cultivate: This manner is a commingling of respect for himself, respect for his customer, and respect for the goods he is selling.

At this manner no one can take offense, and from this manner you can quickly change to any manner to which it may be necessary to adapt yourself.

It is often both laughable and irritating to be waited upon by a smirking, over-polite salesman. His affectation and exaggerated effort to please, instead of pleasing, creates contempt.

There are some salesmen who are discourteous, and others who are indifferent. The fault in many cases lies in their not having been shown the right way of thinking.

If a salesman will constantly think from his employer's standpoint, he will acquire a training that will give him a mental attitude that is beyond price.

Next in importance to knowing his goods is knowing his customers, their wants and their ability to purchase. The high-class salesman makes it a point to first find out what his customer can buy, and when he has learned just about what is wanted as to material, style, price, etc., there is not much effort required to make the sale.

The inexperienced salesman shows goods at random, and it's a mere matter of luck if he happens to hit upon what the customer wants. From lack of information that might have been obtained for the asking, he is likely to show the prospective purchaser something he or she might want, but was unable to pay for, and which might be liked so well that anything of a cheaper grade would cause dissatisfaction. And then a person dislikes to ask the salesman if he hasn't something cheaper, as this is offensive to one's self-esteem. Many a possible sale is lost in this way.

Another common mistake of the inexperienced salesman is to excite a negative suggestion in the mind of a customer by the query: "There's nothing else I can show

you, is there?" To which it is but natural for the customer to respond: "No, I think not." Now, an experienced salesman invariably so words his inquiry as to awaken a positive suggestion. For instance, after a purchase has been made or a customer has reached a decision not to buy the articles shown, the expert salesman will ask: "What else can I show you?" Or he will show some popular novelty and say: "Here is something in the line of the goods you were asking about that we are having quite a run on—perhaps this might be just what you want."

The natural or real salesman knows but one purpose, and that is, to produce profitable results for his employer. This makes for his own advancement.

Be always optimistic.

"Turn your face to the sun and the shadows will fall behind you."

DRESS, APPEARANCE, AND WHAT IT MEANS.

A salesman is generally judged by the manner in which he dresses. In fact, his dress is an index to his character. A salesman who wears flashy jewelry, gaudy neckwear, extreme styles in clothing, hats, or shoes, is regarded as a vain, frivolous, and unsubstantial man. But the salesman who wears conservative styles of good material is instantly regarded as a sensible, prosperous, and substantial man, who is entitled to, and is given, respect wherever he goes.

The sole object of a salesman's dress should be to command respect, not to create admiration. You are on the road to persuade business men, not to fascinate or attract the attention of the opposite sex. To dress poorly, with the object of influencing sympathy, is foolish. Ninety-nine out of every one hundred business men will feel that if you are not successful enough to enable you to wear clothes becoming your position, you ought to seek another occupation.

Your dress is part of your capital. Many men, through an adverse combination of circumstances, have been reduced to pecuniary embarrassment, but by managing to keep up their dress were able to land in a good position.

Keep up your dress, by all means, but let it be like yourself—clean-cut and substantial.

INTRODUCTION

Every person who works for a livelihood has something to sell. This is a fact not usually realized by those concerned, yet a lawyer barters his services, a physician his professional skill, a manufacturer his product, an actor his power to entertain, and a mechanic his technical labor. Whether one be a vender of goods, services, knowledge, ability or credit, it is self-evident that to obtain the most remunerative results he must make the proper presentation of what he has and the most effective use of his natural talents.

Since human nature is the same the world over, it follows that the personal methods which are productive in one instance will be in another, and that there are certain underlying principles that can be commonly applied. The libraries are well stocked with business literature, but the fact remains that nearly all of the available publications are so general in character that they have little tangible value or else are so technical that they are of use only in special lines.

The purpose of this book is to portray a phase of business that, from a practical point of view, is more important than all the others.

It is the human side, whether it be called the psychology of salesmanship, the personal equation, or the fourth dimension, and it is particularly well illustrated by one specific business, —the marketing of bonds, because the latter appeals directly to the mental processes and is the highest type of salesmanship. The plan, then, is to explain the personal methods which were used effectively in building up a dominant organization, with the idea that they are capable of adaptation, and if in this attempt the writer digresses somewhat from the direct path or appears to draw too frequently upon his own experience, it is to give a concrete view of the subject and for the sake of clearness.

In the training of bond men there has long been felt the need of a real handbook relative to the subject,—one that adequately treated of personality in selling and of the means that should be employed to develop an intimate and profitable relationship between salesman and customer; that set forth the broad field open to individuality and explained the most effective courses of thought and action; and that would make men realize that in themselves lay the opportunities they sought and would enthuse them and inspire them to greater effort.

In the Spring of 1913 the writer adopted the

plan of employing simultaneously a number of inexperienced men as raw material for salesmen. Theretofore the training of two or three individuals at one time was comparatively simple on account of the possibility of giving personal attention to each one but with the advent of a larger group, this method became impracticable and the necessity arose of finding some way of training men wholesale. The experiment was therefore tried of collective coaching through a course of ten lectures of a very practical nature given by the writer and various members of his organization. They were informal in character, for the most part extemporaneous, and were reported stenographically.

As these talks were somewhat different from the usual type of financial exposition and far more interesting, extracts are given here from the four least technical ones, and each is represented by a chapter. Attention was paid to neither rhetoric nor diction, but simply to a clear and forceful presentation of the subject. Furthermore, some of the continuity was lost by the speakers being interrupted with questions and by the inability of the stenographer to take down the discussions accurately and in their entirety. The first one (Chapter IX) was delivered by the writer and the other three

(Chapters X, XI, and XII) by members of his staff on outlines which he prepared, and all of them were edited by him, as well as was possible to do from the stenographer's notes without spoiling the directness of speech of the lecturer.

Incidentally the three chapters named show how certain men, without previous knowledge of the business and with limited experience, by being coached in accordance with well defined methods and a consistent policy, developed into three of the most successful salesmen of the time. Each had naturally found his own way of expressing himself but the fundamental training underlying the experiences given, was the result of patient tutoring and carefully conceived plans.

The ideas outlined herein are not the fruit of idle speculation but the result of close application over a period of fourteen years during which the writer advanced from the lowest position to the highest, in the second largest bond distributing house in this country. So while this book falls far short as a literary work, it is based upon broad, practical experience and on that account may help to supply an existing deficiency.

FREDERICK PEIRCE.

June 1, 1917.

CHAPTER I

THE BOND BUSINESS

According to the accepted economic definition all goods, property and commodities constitute wealth. The latter is divided into two classes. The first is unproductive and includes undeveloped real estate, residences, pleasure cars, works of art, and all articles used or consumed in the comfort and enjoyment of mankind. Such things have both actual and exchange value but since they do not in themselves contribute to the increase in the world's stock of goods, are simple wealth. The second or other class includes factories, machinery, railroads, ships and all property which in any way aids in the manufacture or creation of additional commodities. It is productive wealth or capital. Capital, then, is that part of wealth which is used to produce other wealth. This use may be either by its owner or by some one else to whom it is loaned. Therefore one man's wealth may serve as another man's capital.

Since all goods can not conveniently be passed from hand to hand, from one owner to another, or from a lender to a borrower, it is

necessary to have a recognized standard of value or medium of exchange. Owing to its superior advantages this standard, in practically all civilized countries, is gold. For the purposes of appraisement, exchange or loan, then, wealth is expressed in terms of the gold dollar or its equivalent.

Because capital has the power of reproduction its use has an exchange or rental value which is called interest. The productivity of capital depends upon the efficiency with which it is employed. Consequently the rate of interest that may be charged is based upon the relative productivity of capital at a given time in conjunction with the degree of risk to which it may be subjected.

Capital that is loaned is usually evidenced by interest bearing obligations such as notes or bonds. If, on the other hand, it is supplied by two or more owners jointly, and used by them directly it is generally represented by partnership shares if the association is unincorporated, or if incorporated, by evidences of proportionate interest called stock certificates. The stockholder is an owner and entitled to profits or dividends if earned, while the bondholder is a creditor and entitled to interest on the money he has loaned.

Since the bondholder is a creditor, he has first claim on the assets up to the full amount of his claim and in accordance with the terms of the agreement. He likewise has first call on the surplus earnings from operation up to the amount of the annual interest accruing to him, and to the amount of his principal at the maturity of the loan. The stockholder assumes the operating risk but is entitled to the profits of the business after the claims of the bondholder are satisfied.

Surplus wealth accumulates most rapidly in the older, richer and more developed sections of country or lines of industry where it is least needed. Its tendency there is to become less productive or idle and its loan value or rate of interest to decline. Capital is in greatest demand in the newer and undeveloped places or industries where there has been least opportunity for surplus wealth to accumulate. On account of the profitableness with which it can here be employed, the tendency is for its loan value to increase. Capital is constantly seeking investment opportunities and vice versa. Supply and demand tend to equalize and the resultant is a normal rate of interest. This equilibrium is often upset by abnormal conditions. Thus when the supply of available funds ex-

ceeds the demand, interest rates decline and when the demand exceeds the supply, interest rates rise exactly as does the cost of commodities under similar conditions. However, every action in one direction must inevitably be followed by a proportionate reaction or compensating movement and the normal is reached whenever the opposing forces approach a balance.

The development of the natural resources of a country and the creation and expansion of large agencies of production and distribution are usually financed largely through the use of borrowed money. It is seldom that any public or private corporation is able to provide its capital requirements from its own revenues. Stockholders or owners of railroads and industrial concerns sometimes advance part of the funds needed but usually outside sources must be drawn upon. The bond business supplies the machinery through which this is done. Through it unemployed capital becomes a productive force; and surplus wealth is transferred from the place where it has accumulated and become impotent to the place where it contributes directly to the creation of other wealth. The demand for suitable investments is just as insistent as the demand for capital, and the sat-

isfying of this demand means the procuring of securities that are both safe and profitable. Thus the bond business has a double duty and performs a double service—providing capital for those who need it and supplying safe investments to those who require them. One function is the complement of the other and the failure of one means the failure of both.

The bond business is not a parasite in the economy of commercial and industrial progress. It occupies a position that is not only indispensable but one of the most important in modern life.

CHAPTER II

THE BOND MARKET

The average man probably thinks of the bond market as a circumscribed place or district where millionaires and bankers meet and carry on their negotiations for the purchase and sale of securities. Those of some financial experience may have a mental picture of a group of such districts located at points widely separated geographically, such as the various larger cities, but connected by a network of private wires and bound together by a community of interest as inseparable as that which ties together the various units of a legally divorced, modern industrial corporation. Still other people think of the bond market as being confined to the New York Stock Exchange and the few outside exchanges that follow its lead. Not one of these conceptions does justice to the enormous aggregation of wealth, and the great army of investors that constitute the real present day bond market, an institution that extends from ocean to ocean and from continent to continent, and embraces in its vast membership people of every nationality, of

every color and of every degree in the social and economic scale. It is not exaggeration to say that wherever civilized people are found, there is the bond market. The financial districts are merely the focal points, the centers of influence and the clearing houses where the lenders and the borrowers meet through the aid of bankers, brokers and bond houses.

In this country (to which the present discussion is confined) an overwhelming percentage of the bond buyers is composed of people of moderate means. While the aggregate annual purchases of institutions and wealthy individuals reach an almost incomprehensible amount, it is doubtless true that the average sale of bonds for investment is in the neighborhood of only three thousand dollars. Likewise, the personal property of a large proportion of the bondholders amounts to less than twenty-five thousand dollars per person. Statistics on this point are not available and probably do not exist, but these estimates are based on a study of many thousands of transactions that have come under observation.

Investment specialization is probably the most pronounced characteristic of the bond market. Buyers may be classified according to their requirements. The latter may be com-

pulsory by statute or voluntary according to the knowledge, whim or taste of the individual. While it is impossible to be familiar with all the various conditions and the legal restrictions existing in the different states, a general discussion of the subject with a few illustrations will indicate the many sides of the bond market from the buyer's point of view.

Insurance companies, particularly those writing life policies, annually absorb a large volume of securities. Each state has its own laws governing the investment of the capital and surplus funds of such companies. Usually the statutes are quite specific in the matter of capital investment and it is not unusual for it to be confined to the obligations of municipalities located in the states in which the companies are domiciled. Fire, accident and casualty companies are generally allowed a little more latitude than are life companies. With regard to the investment of surplus funds and policy reserves, the directors or trustees are usually given pretty free rein except that many states require foreign companies to deposit with them a certain amount of domestic securities before writing any business in those states. However, these special requirements affect only a small percentage of the investing done by insurance

companies and we find them buying large amounts of municipal, railroad, public utility and occasionally of industrial bonds. The proportions vary according to local conditions and to the preferences and experience of those upon whom devolve the guardianship and protection of the policy holders. To give a comprehensive description of the laws of the various states governing the investment of the funds of insurance companies would require a book in itself, and be quite beyond the intent of this discussion.

Saving funds, that is savings banks without capital stock, are restricted in their investments more than any other class of institutions. These funds are largely confined to the New England and the Middle Atlantic States and the laws covering them are very specific. With few exceptions they are required to invest in real estate mortgages, high class municipal bonds and the best of the steam railroad securities. Many saving funds operate under special charters which antedate the state laws governing them. In Pennsylvania for example, nearly every one has a charter issued many years before the passage of the general act. Institutions of this character are in the nature of a charity in that they are not formed for

profit. Therefore they are concerned more with the matter of safety than they are with the rate of interest. Savings banks with capital stock on the other hand are business corporations and are governed by the same laws as those which cover state banks and trust companies. There are, however, comparatively few banks of this character as a large proportion of state institutions operates under trust company charters.

Trustees of estates are generally subject to the same restrictions as those which apply to saving funds and the requirements of any one state are different from those of every other state. The best and most comprehensive laws are found in New York State and some of the New England States, where definite rules are laid down and within the prescribed limits, trustees are allowed some latitude in their selection of high class securities. In Pennsylvania the law is archaic and a distinct handicap to trustees, as well as a hardship to the beneficiaries for the only permissible investments are real estate first mortgages and bonds of municipalities located within the state. Consequently a premium is placed upon municipal bonds and mortgages of inferior quality, or else an estate must be satisfied with a compara-

tively low rate of interest. To avoid these two extremes, many wills contain express provisions waiving the law and relieving the trustees of any responsibility for errors of judgment.

Trust companies may invest in practically anything they desire subject only to the supervision of the state banking departments in order that their capital may not be impaired and their deposits jeopardized. Some states require that reserves must be maintained equal to a fixed per cent of the deposits, and that these reserves must be invested in certain specified classes of securities.

National banks have almost as much latitude as trust companies except that they are under the direction of the Comptroller of the Currency, whose supervision is more strict than is usually the case with state officials. Definite rules, however, are laid down by statute with regard to security for national bank notes, for government deposits and for postal savings funds.

The private investors or individual buyers are greater numerically than all the various institutional purchasers of securities combined. They constitute the great ultimate market, the market that buys to hold. Banks and trust

companies as a general rule prefer to loan their funds to their depositors—to "grant accommodations" that will bring them additional business. Outside of their reserves, they look upon their bonds as liquid assets that can be converted into cash whenever they find it of advantage to do so. Therefore they are usually more interested in the ready marketability or the possibility of profit of a bond than they are in its permanent safety. Frequently they take participations in new issues with the avowed intention of reselling them whenever they can obtain a profit even though in so doing they place directly or indirectly upon the house of issue the burden of remarketing the securities at advanced prices. The individual investor, however, except in rare cases, buys to hold, with safety of principal the paramount consideration. Only a very small percentage of his purchases comes upon the market again. He is not such a close buyer as the institution, he invests more largely in the class of securities in which there is a reasonable amount of profit to the bond house, his business is not so competitive and he does not weaken the market by throwing over his holdings on the least provocation. For these reasons the private investor business is preferred by many bond houses and eagerly sought after by all of them.

Probably the one thing that causes the most sorrow to the conscientious bond house is the fact that so few customers, whether banks or individuals, can differentiate between good bonds and inferior ones. This, of course, makes it easier for the vendor of second rate and third rate goods, but it increases the difficulties of the house that is honestly endeavoring to handle only sound issues and by so doing to win and hold the confidence of the investing public.

CHAPTER III

THE BOND HOUSE

There are almost as many different kinds of bond houses or investment bankers as there are men of different ideas in the business. In other words, the methods pursued and the policy followed by any given firm are based upon the theories and experience of those who control and direct it, and likewise its standard of ethics is in proportion to the integrity of its head. There is probably no other business where the personal equation is so directly reflected in methods and policies. While it is neither possible nor expedient to attempt to give here in detail the distinguishing characteristics of all the different kinds of organizations that devote themselves wholly or in part to the selling of securities, a brief outline of some of the more prominent types is necessary to convey an intelligent idea of the scope and character of the business.

Certain large firms confine themselves exclusively to wholesaling. They are limited in number and each negotiates annually transactions aggregating hundreds of millions of dol-

lars. They are known as exclusively underwriting or originating houses. Frequently in large operations two or more of them work together. They usually distribute their purchases through selling syndicates, composed of distributing houses and bond dealers generally. Sometimes there is an intermediate group or purchasing syndicate composed of the larger banks and distributors which takes the bonds off the hands of the wholesaling houses, and guarantees their sale through a selling syndicate, the members of which place the securities both through brokers and direct to customers. Thus, between the original borrower and the ultimate lender a bond may pass directly through the hands of four or more middlemen, each of whom levies his toll in turn. This, however, is an unavoidable feature of large financing, and the cost of the operation is not out of proportion to the service performed, though frequently the compensation is not divided in accordance with the responsibility assumed or the work done by the various participants.

The form of a syndicate varies according to the nature of the financing, but generally speaking a wholesale house buys from a government, municipality or corporation a block of bonds at a given price, and sells it at a higher

price to a group of houses which in turn disposes of the issue at the final price to the ultimate consumers. For instance, a railroad corporation in financing its requirements might sell to a wholesale house a large issue of bonds at 95 (cents on the dollar). The wholesale house in turn might resell the entire block to a syndicate at say 97. The final selling price to the public might be fixed at 98½, and usually from this final price there would be a brokerage or commission to the distributing house, all or part of which commission might or might not be given up, according to the terms of the agreement, to brokerage houses not members of the syndicate. Syndicate members are entitled to the selling commission upon all bonds drawn down or placed by them, but the syndicate profit is divided not according to bonds sold but according to the proportionate participation or liability assumed by each member. If a syndicate is not a success, that is if the bonds do not prove a ready sale, the unsold balance is usually divided among the members in proportion to their participations. The writer has long felt that syndicates as an institution were not fair to those who did the most work and obtained the largest results and to offset this, he provided in a syndicate which he had

occasion to form some time ago, that the profits should be divided two-thirds according to the amount of bonds sold by each member and one-third in proportion to the contingent liability assumed by each.

This same view is common to many other dealers and during the past two or three years there has been an evident attempt to equalize matters by providing for a sliding scale of selling commissions based upon the amount of bonds sold. Of the two methods named the straight division of profits into two classes, is the fairest and most efficient method and best accomplishes the desired results, that is, the ready sale of the bonds with a just distribution of the profits to all concerned. An even greater inequality usually exists in the division between the wholesale house and the selling syndicate as a whole. However, as the wholesale house always controls the financing, and invites the members into the selling syndicate, it is in position to dictate the terms. Any house that does not care to accept an invitation on the predetermined basis, may stay out, but at the risk of not being invited a second time. The success of a wholesale house is based upon its prestige, its past record, its large capital, and particularly upon its community of interest

with large banking institutions which lend the financial assistance necessary to carry a large operation from the time the bonds are bought and paid for until they are split up into blocks among various syndicate members or else distributed to the final purchasers.

Big business requires big financial machinery, and the wholesale houses are in position to furnish it on account of their experience, prestige and available resources. Though this system has many disadvantages and is more or less monopolistic, that it is the only practicable one is evidenced by the fact that nothing else has ever been developed to take its place. While large operations might occasionally be financed by popular subscription during propitious times, the public purse could not regularly be depended upon for direct support and the assistance of strong agencies is required. A borrower can not ignore the money lender during periods of easy money and then demand help when conditions are stringent. The fat and the lean must go together.

Next to wholesale houses in both capital and influence are the so called distributing houses, which vary in size and importance from those handling only one million or two million dollars a month to those that distribute annually

several hundred million dollars of bonds. They participate in underwriting syndicates organized by the wholesalers, and frequently two or more will purchase from the wholesaler entire blocks of bonds and resyndicate them. They also originate their own issues, consisting usually of municipal, railroad divisional or equipment and public utility bonds. Although frequently up in the millions these issues are generally smaller in amount than the large government or railroad loans financed by the more important of the wholesale firms. Distributing houses do a wholesale and a retail business simultaneously. Practically all of them employ bond salesmen; some of them in connection with their main offices only, in which case they generally work through correspondents in other cities, while others maintain large organizations and operate a number of branch offices. They distribute bonds direct to their customers at list prices and also sell round blocks at special prices to retail dealers. The distinguishing characteristic of the higher class distributing house is that before purchasing an issue of bonds it makes a searching examination of the property and of the credit of the borrower, and in doing so employs legal, engineering and accounting experts. The dis-

tributing house comes in contact in a broad way, with the general public and is supposed to feel a strong moral obligation toward its customers, and to be ever watchful of their interests, whereas the wholesale house is a sort of middleman between the borrower and the distributing or retail houses, and assumes practically no responsibility as to the safety of the securities it underwrites. The distributing house is the real connecting link between the bond issuer and the bond buyer and this book is written with the idea of being particularly applicable to the relation so existing.

The retailers belong to the large and very important class of firms that possess moderate capital and do not essay the role of originating houses. Probably a large proportion of these firms is composed of men who in their earlier days were salesmen for older houses. Retail houses participate in underwritings, purchase round blocks of bonds outright from distributing houses on a dealer's basis, and also buy and sell bonds on the open market. As in the case of the other types of houses, they may or may not be members of a stock exchange, or the stock end may be the principal business and the bond department only a side issue. Each retail house of course has its own circle of customers and its own sphere of influence.

There are a great many stock exchange firms that buy and sell listed securities on a commission basis only. Such houses do not keep bonds on hand for sale but merely execute orders and therefore are not concerned in this discussion.

Street brokers are men who trade between houses and principally in unlisted securities. They claim to work on a straight commission, do not generally carry bonds on hand and are not supposed to have any direct dealings with institutions or private investors. Their function is to know all of the different markets, and where odd blocks of bonds may be bought or sold to the best advantage. Their reason for existence is that they perform a service for which other houses prefer to pay a commission rather than take the time and trouble to do the work themselves.

The different kinds of houses blend into each other, their types change with changes in conditions and a house may belong to one class in one piece of financing and to another class at another time so it is impossible to earmark every bond firm in the business and say that it belongs to this class or to that class. In a general way, however, the remarks made in the preceding paragraphs portray the principal distinguishing characteristics of the various

bond underwriting and bond selling firms as they exist at present, and as they will no doubt continue to exist for many years to come unless there is a radical and unexpected change in fundamental conditions.

Before leaving the subject it may not be amiss to say a word about the firms that attempt to do a stock exchange business and a bond selling business at the same time. Except in rare cases this combination does not work out advantageously and one or both branches of the business suffer. If the members of the firm are primarily interested in the stock end they devote their energies to that while the stock market is active, and neglect the bond end. When the stock market is dead, they switch their attention to their dormant bond department and expect it to spring into sudden activity and to produce the earnings that were previously made by the stock department. The bond business, however, can not be successfully developed that way. It is the product of long study, and careful attention. It cannot be neglected and allowed to go to seed, and then suddenly forced and cultivated, and made to produce a profitable crop. The stock broker is usually a man of impulse and action. He wants results and wants them quickly. He lives fast

and works fast while he works, but has not the patience and the studious disposition that are necessary to develop a successful bond business. The bond dealer to be successful must be an organizer and an untiring worker. He must be satisfied with a more gradual growth and with smaller profits but he must keep hammering away without cessation, making each stroke tell in the permanence of his work. Where a firm desires to do both a stock exchange and a bond distributing business the best results are obtained by having two distinct executive organizations, each composed of specialists in its line. The employees in the bond end must be kept entirely out of the atmosphere of the board room and they must throw their influence against any strong speculative tendencies upon the part of their customers. A clientele of bond buyers, to be profitable, must be permanent while the margin account houses seem to be able to make money with clienteles that change periodically every few years.

CHAPTER IV

SALESMANSHIP

Salesmanship is an art, but Bond Salesmanship is a profession, and it has one great advantage over all of the others in that the route is much shorter to success or oblivion. While law, medicine and engineering are numerically more prominent, their average compensations are lower and they require a greater length of time for an individual to determine whether or not he is adapted to any one of them. They necessitate three or four years of study and preparation, not only without any remuneration, but with a considerable monetary outlay and then it may be some years afterward before a satisfactory revenue is produced. Custom, false tradition and "ethics" are a barrier to individual energy and initiative, while for a doctor or a lawyer to advertise would immediately stamp him as being entirely beyond the pale. In bond selling the probation period is much shorter, returns accrue more quickly and the average compensation is considerably higher because aggressive competition and the law of the survival of the fittest promptly weed

out the inefficient. At the same time, for those who are fitted for bond selling the opportunities are unlimited and the rewards of success place a high premium upon individuality.

Salesmanship is the most practical course in the school of life and bond salesmanship is a postgraduate subject. It is the highest type of salesmanship, it deals in a superior form of commodity and it brings one in contact with the best class of trade. It is for these reasons that one who aspires to bond selling should be above the average in character and ability.

Nothing develops a man so well as contact with other men and with big things. To be familiar with securities, means to be familiar with country wide and with world wide conditions in general, and with municipalities, corporations and markets in particular. Every issue of bonds is different from every other issue. The stock of goods that a house has for sale and their prices are changing almost every day. As a capable bond man not only has to know his own wares but those of his competitors there is ample opportunity for brain work. A bright young man once applied to the writer for a position, saying that he was a very successful salesman of fountain pens, but that he had reached his limit in that line because he

knew all there was to know about a fountain pen. This criticism could hardly be made of the bond business for no one has ever been heard of who knew all about bonds.

To win success, a man must have both ability and opportunity. Except in rare cases one without the other is ineffectual. Opportunity is usually the result of acquaintance. A bond salesman, by the very nature of his profession, meets more people of means and influence than does one in any other line of work. It is no doubt due to this fact that many salesmen of ability do not long remain salesmen for opportunities are constantly thrown open to them and if an existing connection is not satisfactory or sufficiently lucrative, a new association may readily be formed. A really good salesman in this or any other line need never seek a position.

It is not to be assumed from this that all or even a majority of those who undertake the bond business succeed. Unfortunately the glamour and the prevailing air of prosperity attract to this profession many young men who are either unfit for it temperamentally or who are not willing to make the personal sacrifices, to give the close application, or to devote the untiring effort that are essential. Bond selling

knows no union hours and he who watches the clock would better seek some other occupation. From his own observation and experience in training men the writer calculates that on an average not more than one in five makes good, and some of the reasons therefor will be found in subsequent chapters.

Special classes of investors require special classes of bonds and special methods of sale. It is not within the province of this discussion to go into technical details or trade customs. Our concern here is with the personal side of bond selling and with the subject in its entirety rather than its ramifications. These remarks are therefore particularly applicable to the ordinary buyer, the man who is a free agent in his investment operations and is not restricted by laws or limitations in the exercise of his judgment. We are interested in his mental processes, in the methods that must be employed to sell him, and in the type and training of the salesman who can do it.

It is safe to say that no two investors ever think just alike. "Many men, many minds" is as true here as anywhere else. It is seldom that any bond offered is quite what the customer thinks he wants. If it is satisfactory in certain particulars, it is probably unsatisfac-

tory in others. If every security was exactly what a buyer thought he wanted, there would be no need for salesmen. Consequently the art lies in diagnosing a person's real needs and then selling him the issue one has that comes the nearest to meeting them. The salesman who yields absolutely to a customer's idiosyncrasies, regardless of his own judgment, is not a salesman but an ordertaker and there is no profit in ordertaking. The real salesman, by argument and suggestion, directs his customer's mental processes. A buyer frequently thinks he requires a particular kind of security when actually something entirely different is better for him. A desire must exist or be created before a sale results. The real profit in bond selling lies in making a customer want that which the salesman thinks he should have. This is not so difficult as it may appear for certainly ninety-five per cent of the investors buy on confidence with little knowledge of what they are buying, or of investment principles in general. When both the house and the salesmen inspire confidence, everything else is of minor importance.

Very few bonds are sold on analytical explanations or comparisons. The average man wants to place upon some one else the responsi-

bility of making up his mind for him. As one salesman expressed it, he had to do his customers' thinking for them. It is really unfortunate that so few people are willing to make a study of their investing. If they would do so, many a dollar that is now thrown away could be saved, the conscientious efforts of the higher class bond houses would be more highly appreciated and these houses would be relieved of a responsibility which they would much prefer to see placed where it belongs.

It is impossible to make a salesman. He must be born to it, and all the so called schools, character studies, correspondence courses, and different methods of training are futile if the necessary ability is not inherent. Whether it be called personality, knack, personal magnetism, or what not, it resolves itself primarily into two things (1) ability to inspire confidence (2) ability to work incessantly. These qualities may lie dormant or may be concealed. Study and training may bring them to the surface, or may add polish and finish after they are brought out, but unless they are born in a man, his chances of great success are very small. Compared to these two qualities,—technical knowledge and training, studiousness, acquaintance, personal appearance, adap-

tability and all the other virtues are of very minor importance.

In his early days as a sales manager the writer used to think that he was a pretty good judge of character, but after talking to men by the hundreds, employing them by the score, and watching their work year by year, he discovered that those who made the best first impression frequently petered out while those who appeared to be in the doubtful class frequently made the greatest successes. He therefore came to the conclusion that there was only one sure way to read character, and that was by the law of averages. Hence, for some years, in taking on new men for the sales organization, he has been going on the theory that only those should be passed by who unquestionably had negative personalities or were clearly unsuited for the work; that little attention should be paid to stature or physiognomy; that if a man possessed a fair education, looked sound, had a clean record and character, and had to work for a living he should be given a trial and that out of every so many men so chosen a certain percentage would make good. In other words, after eliminating those clearly unsuitable, it resolves itself simply into a trying out process and the survival of the fittest. This

may appear very impersonal and very mechanical, but it nevertheless is a mathematically correct method, is businesslike, is reducible to a scientific basis, and though more evident is not different from the conditions and methods prevalent and in operation in every business and in every walk and in every phase of life.

CHAPTER V

MATERIAL FOR SALESMEN

In building up a sales organization the material available narrows down to three general classes; viz., (1) men with previous bond experience (2) young college men (3) men from other lines of business. The writer proposes in this chapter to attempt the comparison of these classes and an exposition of the advantages and disadvantages of each.

Good salesmen with previous bond experience are always in demand, as is evidenced by the numerous advertisements in the daily newspapers and in the various financial periodicals. This demand is due to the fact that the great majority of bond houses (1) can ordinarily buy more bonds than they know how to sell; (2) have the courage to employ salesmen only when they can get ones who they feel confident will make money for them; (3) do not themselves know how or have the patience to develop inexperienced men, and (4) expand and contract their sales forces with the changes in business conditions, so that instead of carrying trained organizations through dull periods,

they are forced to recruit them suddenly whenever business is prosperous. Competent salesmen all make good livelihoods and are usually paid pretty nearly what they are worth. Consequently they do not as a rule look around for other openings unless dissatisfied with working conditions where they are employed. This latter condition is rare so that it is seldom that a really good bond salesman seeks a new connection. More often the position seeks the man.

It therefore follows that when a so-called experienced man applies unsolicited for a position, it is more than likely that he is a discard or a floater. In the previous chapter it was mentioned that in the trying out process about one man out of five develops into a real success. This means that four out of the five are disappointed and seek new places. Strange to say, to most of them there is a fascination about the business so that they stay in it instead of trying something else of a different character. After a man has changed positions a few times he usually becomes a floater, staying with one house so long as his welcome lasts, and then seeking another. For the reasons previously given, the demand for experienced men is such that if one has a fair knowledge of bond technique and can put up a good front, with a few

confidential remarks about his personal customers, he can usually land a job even though his tenure of office may be brief. The writer knows of one so-called salesman who has been floating from one house to another for the past fifteen years. This man has certainly averaged less than one year to each place, and yet he comes up smiling with a new one whenever the occasion requires. Apparently in the employment of experienced bond men, much is taken on faith, and references do not seem to be essential.

While in hiring ready-trained men who apply for positions, a "live one" may some times be acquired and added to the force of producers, this possibility is rare indeed, and the odds are heavily against the employer. Less risk is assumed in stealing or (to be more polite) in buying a man away from a competitor but this too has certain dangers. In the first place every salesman is presumed to know what he is worth; unless he is more modest than usual, he is presumed to be getting it; and his employer is presumed to be paying it to him. If he is entering the discard class, and a competing house makes him an offer, that house stands a pretty good chance of having a failure wished upon it. On the other hand, if he is a

success, regardless of degree, and a competitor steals him, it runs the great risk of having paid too high a premium to get him away, and when a man costs too much, he is just as much a financial loss as the man who costs proportionately less and is a failure. The house that employs a man is in a great deal better position to know what he is worth, and to pay it to him, than a competing house that must base its opinion entirely on outside indications.

Of course there is always the possibility that a salesman is not in congenial surroundings or is not developing his greatest efficiency under given conditions, and that if transplanted, he will reach a much higher development. This, however, is largely a matter of guess work and it is extremely dangerous to offer a man a higher salary than he is getting on the assumption that under new conditions he will be able to produce more than enough to offset the increase in compensation. It is more likely that he will lose efficiency and producing power by being transplanted, for a salesman seldom has the same loyal regard and enthusiasm for his second employer that he had for the one that taught him the business and helped him over the rough places in the beginning. This does not hold good when a man advances from a

conspicuously inferior house to one of much higher credit and standing, but even in this case it is inevitable that he should unconsciously or instinctively compare methods and conditions existing in the new association with those in the previous one. Enthusiasm is the greatest factor in commanding confidence, and in inspiring one to hard effort. It is ruined by the continual drawing of comparisons, by mental reservations and by distracted attention. Unless one's whole mind, thought and action are focused in one direction there can be no real enthusiasm. An organization to be successful must have the wholesouled support and undivided cooperation of its component units and its directing head must be engaged in constructive work and not diverted to eradicating antagonistic or contrary ideas, principles and methods previously gained by experienced men in prior positions.

The writer realizes that if a properly trained, well balanced and successful salesman of experience and judgment can be secured at his actual value as a producer, he is cheap at the price, and worth to any house a great deal more than a number of inferior or inexperienced men all taken together. There has never been the slightest room for argument or doubt on this

point. However, the chances of securing enough men of this type are so slim, the risk of losing a lot of money in trying to get them so great, and the certainty of loading up with inferior men so sure that the writer has never been favorable to this method of recruiting an organization. Last, but not least, there is the question of ethics in the matter of taking men from competitors. Some houses are very punctilious and make a practice of applying the Golden Rule to this particular feature of their business.

As a class young college men in business are a particularly difficult problem, due first to lack of home training and second to a type of education that aims at the broader phases of life but neglects the essentials. Parents are too lenient in bringing up their children. Discipline, prompt obedience, accuracy, thoroughness and the homely virtues are the foundation of character. If these are neglected in the earlier years, inefficiency is bound to be the result and college education and technical training are unable to counteract it. Success or failure can largely be traced back to the kind of training a man had before reaching the age of twenty-one. This situation is aggravated by the fact that only a small proportion of

young men attend college with a serious purpose in mind. For the first time in their lives they are entirely free from restraint, the opportunity to waste time is ever present and the stern realities of life are obscured by the distortion of relative values. Fraternity and dormitory life, athletics and social activities assume undue importance. The curriculum is directed almost entirely toward mental expansion, and but little, if any, toward character building. At the risk of being accused of heresy, the writer ventures the opinion that to the majority of men who attend college the benefits are negative; in other words, a college education spoils many a good clerk. A man of character, initiative and indomitable energy will rise to the top regardless of his degree of scholastic education. When such a man goes to college and gets out of it all it holds in store for him, the benefit of such an education is inestimable. It opens up to him greater possibilities than he could otherwise attain even though possessed of great natural ability. On the other hand, if he slides through college with no particular ambition and no set purpose in mind, the influences of his environment and the lassitude of his mental habits are not calculated to strengthen his character. Unquestion-

ably the greatest function of a college course is to give one breadth of thought. Therefore if one is not made to think, his mental processes do not undergo the expansion that is intended for them. Far better that a youth should get four years' practical application behind a counter than allow his brain to gather moss for such a period.

A man must be able to do the little things of life and do them right before he is capable of doing the big things, and a minor task correctly performed is indicative of ability to do a larger work properly. Some years ago a writer employed as sales material a University man of considerable prominence in the various collegiate activities. One day, during his probation period in the office, a window shade fell down and this man was asked to fix it. He had to admit that he did not know how! What are we to expect of our University graduates when they are incapable of performing such trivial tasks?

The greatest criticism then of the average college man is that he hasn't been trained either by his parents or his Alma Mater to do the little things right before feeling that he is capable of assuming greater responsibilities. In this respect he is not much farther along than the

grammar or high school boy who has not had all the advantages and of whom so much is not expected in the beginning. Undoubtedly this deficiency or lack of discipline will be partly overcome if the system of universal military training is adopted in this country and incorporated in our college curricula.

The second great criticism of the young college graduate is his exaggerated idea of his social and economic position, and of the revenue producing value of his education and ability. While in college he gathers the idea that he belongs to a higher plane than the ordinary mortals around him, that he is destined by the nature of things to be a leader and that of his own right he must be looked up to. Therefore when he accepts his first position and finds himself located at the mailing desk at five or ten dollars per week the business machine seems to have slipped a cog somewhere. When the days run into weeks and the weeks into months and promotion and pecuniary emoluments come slowly, the discouraged college man reaches the conclusion that he has picked the wrong job and that the other business just across the street is the one he should have chosen, so he gives up his position and starts in over again and the process is repeated. Very

often this discontent is due to the fact that the college man has developed his tastes too far beyond his earning power and he is constantly obsessed by the desire for more money. Frequently, too, he discovers that he wants to get married and support a wife even before he can support himself.

After a college man has yielded to this siren call and wandered through two or three positions in search of greater opportunities he suddenly awakens to the realization that he too must not only begin at the bottom, but must stick to one thing and climb slowly and surely the same as anyone else. By experiencing a few hard knocks he discovers that there is no short cut to success and that hard work is the quickest route to recognition and advancement. Only when he buckles down to serious effort and realizes that after all it depends upon him and him alone, does he begin to appreciate the opportunities in his own line of work and see the folly of jumping from one position to another.

When a college man of character and ability reaches this stage, when he "gets down to earth" he is ripe to be taken in hand and developed to the highest degree. It therefore follows that in employing college men, all other things

being equal, the best results are obtained by taking those who have been graduated for three or four years or more and have just arrived at the point described.

This detailed portrayal of the faults and weaknesses of the college man cannot obscure his one commanding advantage over the other two types described in this chapter, namely, his enthusiasm. It is obvious that a young man just entering business life may be enthused much more easily and may communicate that enthusiasm to others more readily than an older man of more varied experience who has tasted of some of the disappointments of life, and has become more or less skeptical of its opportunities. The greatest productive asset of a young man is his initial enthusiasm. It is worth more in dollars and cents than experience, acquaintance, influence or anything else. Therefore when a college man has made the most of his educational advantages, has reached the hard work stage and still possesses his youthful enthusiasm, he presents a combination of business advantages that offset his lack of judgment and experience and make him particularly available for training as a bond salesman.

Our third group of available material in-

cludes men of more mature years—say thirty and over—inexperienced in the bond business; men who, with few exceptions, are self made, who have had limited educational advantages, and who had to start to work early in life. This type of man presents our greatest problem in the selection of individuals. With the experienced men it is merely a question of past record and present performance with the risk of loss limited and the employment terminable on short notice. In the case of the college man the cash outlay is small and the possibilities good for securing a fair percentage of successes. With our third class of men results depend upon a fortunate selection of individual units, involving a certain amount of character reading, a larger amount of luck, and at last analysis the working out of the law of averages. As a rule those who have not made satisfactory connections before they are thirty are below the average in ability. There are, of course, many cases in which this does not hold good, but the proportion is strongly as stated. This condition is even more pronounced when the age of forty is reached. It therefore follows, with rare exceptions, that any man of forty or more who is willing to enter a new line of work at the price of raw material, has not sufficient ability to qualify him for the bond business.

Men of middle age have lost their enthusiasm as a rule, and are hard to "warm up," they are difficult to direct, frequently tell us how the business ought to be run, find fault with existing methods after they have been doing outside work for only a brief space of time and are easily discouraged. Also to an employer who is at all sympathetic the matter of dismissal is always more embarrassing in the case of such employees and is usually delayed much longer than it should be even though sentiment is supposed to play no part in business.

In going over the roll of men whom he has trained, the writer is frank to admit that the greatest individual successes have been developed from this third type of material, namely men of more mature years with previous experience in other lines of business. As a corollary, he has also lost the most money in trying out men of this type. However, the progress of a business is determined by the results obtained not by the exceptions but by the organization as a whole, and it has always been his experience that the best average is maintained by men recruited from the second group.

While always on the lookout for a "find" and while one can sometimes be secured through a special combination of circum-

stances, the sales manager who spends his time hunting for such articles instead of developing his own men is not going to expand his organization very rapidly. Each applicant for a position must be considered very carefully and those selected must be coached properly, but the final result will be determined by the law of averages. With such variations as have been mentioned experience seems to prove that the percentage of successes is about as great with one group of men as with another, and if carefully chosen it may be assumed that one man out of five will make good. Let us therefore figure how this works out in dollars and cents. If five older men be taken on at $150 per month each, or a total of $750 per month, and one succeeds, it costs $750 a month to produce him. If five college men be taken on at $10 per week each or a total of $216.66 per month and one succeeds it costs $216.66 a month to produce him. Against five older men at $750 per month, seventeen college men can be employed at the same expense and they will produce more than three times as many successes.

This same method of comparison may be employed in the case of men with different relative salaries, but each must be classed with

others drawing the same amount of money. In other words, a man getting $100 per month must be compared with others receiving the same for it must be figured that if a man is paid $100 per month, and develops into a success it has cost $500 a month to produce him, and a success at $200 a month has cost $1,000 a month to produce. The successful man has to bear his share of the cost of the unsuccessful ones the same as the consumer who pays his grocery bills has to pay for the food of the consumer who does not and the same as the tax payer has to carry the burden of the economically dependent.

This is a feature of the employing of men of which the sales manager seldom thinks, or if he does consider it, rarely reduces it to a mathematical basis. If he belongs to the school that tries to hire successful men already trained and proposes for instance to pay an applicant $300 per month, does he realize that either the salesman is not worth $300, or else he has cost some other house a good deal more than the amount named and must be a bargain at the price? A sales manager who is a good judge of bargains may be able to gather together a satisfactory organization if enough bargains are offered, but the man who makes a profession of bargain hunting usually pays high in the long run.

Assuming then that we accept the training of green men as the most successful method of developing a sales organization, the logical thing is to keep down the cost of the raw material regardless of the source from which recruited. Obviously it is not good business to spend any more money than necessary on experiments. Therefore the recruit should assume his part of the risk until he can demonstrate whether or not he is going to be a success but after he has made good his employer should compensate him for his sacrifice in the beginning. Until a salesman makes good, he is a liability and not an asset, and of course business prudence demands that one should limit his liabilities as much as possible, but when a man moves over from the liability column to the asset column his position as an asset should not be undervalued, else he is warranted in eliminating himself from the balance sheet altogether.

At last analysis a house is not only justified, but is only exercising ordinary business sense in buying its raw material at as low figures as possible. In doing so it does not attempt to pay a man what he is worth for it has no way of determining what is a given man's worth, but is merely advancing a nominal stipend

until the man himself can demonstrate his value and claim the rewards to which he is then entitled. A willingness to make a temporary monetary sacrifice is evidence of a man's judgment, seriousness of purpose, determination and self confidence. If he is not willing to do this, the chances are he is not the most desirable material available.

CHAPTER VI

EMPLOYING MEN

Aside from the initial formation of its sales organization, every progressive house finds it necessary to constantly add new men to take the places of the occasional ones who leave after reaching productive positions, and of the many who are tried and found wanting. While now and then recruits may be obtained from those who call of their own accord or who apply through the personal recommendation of mutual friends or acquaintances, or through other employees, the number of suitable applicants who can be so secured is comparatively small and the building up and maintaining of a large force in this manner is a slow, tedious and difficult process. A large organization therefore usually finds it necessary to make use of collective employment. For this purpose two methods are ordinarily available in securing raw material (1), advertising in the daily papers (2) getting in touch with the graduating classes of the different colleges.

Notices in the financial pages of the newspapers have not been found so productive as

advertisements in the columns headed "Help Wanted—Male," for the simple reason that the number of experienced men open for engagement is far exceeded by the number of green men seeking positions and the latter read the classified advertising rather than the financial pages. After several years of experimenting, through which he learned much about the psychology of "want ads," the writer worked out the following standard form of copy, which is quoted to illustrate some of the points in mind.

"PROMINENT BANKING HOUSE will make positions for three or four young men to become bond salesmen. Must be graduates of regular day courses of recognized colleges or universities. Real opportunity for men of initiative and ability who are willing to learn the business and make it their lifework. State age, when and where graduated, business experience, immediate salary required and any other items of interest."

"College graduates" is specified, not because a college education is necessary to a man to win success in the bond business, but simply as a labor saving device to eliminate the innumerable applications that would otherwise be received from the host of young men of unsuitable heredity, environment or education who are always on the lookout to change from one wage earning job to another in the hope of

adding a few dollars more to the weekly pay envelope. While it is true that this qualification discourages some very good material from applying, it is a necessary limitation in order to save the advertiser from being swamped by a flood of letters. As it is, many of the more progressive or more ambitious disregard the specification and apply anyway, and the best of these the advertiser may follow up if he so desires.

The expression "graduates of regular day courses" is used. Practically all of the universities in the larger cities maintain evening courses, and the men who attend these usually consider that they are college men. Experience shows that only a small proportion of them are available for bond salesmen and so this specification also is a labor saving device.

"Immediate salary required" reveals of itself a whole lesson in human nature. Several times the writer used the expression "Initial compensation $10 per week" only to discover that the replies were confined mostly to youngsters entirely unsuitable for the purpose in mind. The words "immediate salary required," however, usually bring in a host of applications from men who want anywhere from $5 a week to $5,000 a year. Many purposely set high figures

for their own protection until they can learn the nature of the position and of these not a few are willing to start at very nominal figures after the details and opportunities are explained to them. Thus a much wider variety of material is offered the advertiser from which to make his selection.

In getting in touch with the graduating classes of the different colleges, whether it be done by letter, by personal visit, through the faculty or through college employment bureaus, the methods are elementary and need not be enlarged upon here.

Interviewing candidates is the most irksome task that falls to the lot of a sales manager. In the first place he knows that the chances are ten to one that the applicant will not prove available, and yet no matter how busy he is, he can not afford not to talk to the man who wants a job for there is always the chance of getting "a find". When he has to talk to them wholesale (and the writer has interviewed as many as a hundred in one week) the work is exhausting to say the least. Again the average applicant is nervous and not at his best. The sales manager must put him at his ease, preferably by finding out the particular thing that interests him the most and encouraging him to

enlarge upon it and forget himself if possible. Many men who make the best "front" when applying for a position fall down completely later on, while some who appear backward in the beginning, develop into the best salesman. While an ability to make a good first impression is always an asset, it is much more important to wear well, and a nice appearance and a glib tongue do not encourage the same confidence as time goes on that is inspired by ability, thoroughness and sincerity even though the latter are housed in a less imposing exterior.

The green man has a very vague idea of the placing of securities, and the details of salesmanship. Much time is therefore taken up in giving him an intelligible explanation of the nature of the position for which he is applying and of the opportunities which it offers. Likewise to size up the qualifications of the applicant, requires much patient and skillful questioning upon the part of the sales manager. When this is multiplied by the number that must be interviewed in any given period, the waste of time and of nervous energy is entirely out of proportion to the amount of material found available. Sometimes out of as many as twenty-five applicants the sales manager will select only one as justifying in his judgment the time and expense required in training.

To reduce the interviewing of candidates to a system, as much as possible and to save his own time and strength, the writer worked out a form of application blank, which is here reproduced to facilitate the explanation of some of the important points involved.

The fourth page of the blank gives a general statement of bond salesmanship, summarizing briefly some of the information given in previous chapters of this book. This explanation is the foundation for that which may be told the applicant subsequently during his interview. It also helps to eliminate curiosity seekers and floaters looking for a soft berth, and saves the sales manager some unnecessary sessions with them.

The words "Salary required" appear on the first page. This is to classify the applicant according to his own idea of his value, and also to indicate the maximum that will have to be paid him. Next his family history, connections and standing are important as bearing upon the desirability of his associations. Then his educational qualifications are given. If he is a college man, his record must be given on page two and if he has not accomplished something in at least one field of undergraduate activity, it does not speak well for his ambition or ability.

Nothing promises success for a man in the future so much as having worked his way through college. If in addition to this, he has accomplished something in the way of scholarship, athletics, literary work, dramatics or the hundred and one things a man in college can do, his record is all the better. Health is not the least valuable asset of a salesman. If a man does not possess vitality and endurance he cannot give out any personal magnetism or maintain the degree of enthusiasm that is necessary to a successful prosecution of his work. Likewise his powers are impaired by inveterate drinking or smoking, and modern business efficiency will not countenance the salesman whose approach is heralded by the odor of stale tobacco or alcohol.

If an applicant has had previous business experience a complete record of all previous positions is essential. This record must be examined into very carefully, and checked accurately backwards and forwards by personal questioning to make sure that the candidate has not purposely omitted some chapter in his business life that he does not want looked into. The number of positions a man has held, and the duration of each afford the best possible line on his ability, seriousness of purpose,

Application for Position as Bond Salesman With

Frederick Peirce & Co.

BONDS FOR INVESTMENT
1411 CHESTNUT STREET
PHILADELPHIA

Full name

Present address

Permanent address

Salary required

$ ____ per week; $ ____ per month

Present Telephone No.

Date of birth ____; Present age ____; Place of birth ____

_____

_____

_____

and steadfastness. A varied business career condensed into a brief space of time is not a strong argument in favor of one's fitness to undertake a line of work that requires application and determination. On the third page the question of an independent source of income is important for if a man does not have to work for a living he usually lacks the incentive that is necessary to accomplish a difficult sale. The questions "What is your hobby" and "What is your ambition" usually develop some interesting sidelights of a man's character, and frequently divulge the real purpose of the applicant in seeking a position. The writer remembers the case of a young man whose ambition was "To own a chicken farm", which statement developed the fact that he desired to hold a position only long enough to earn some money to enable him to go into the business of raising poultry. As we were not spending our time training men for the fun of it, this young fellow of course did not get the job.

Each question on the blank is the result of experience gained in talking to many men, and has an underlying purpose, even though the latter may not be apparent and the questions may appear irrelevant. Every once in a while some sophisticated applicant makes the remark

"You don't expect me to answer all of these questions do you?" or "If I were the kind of a man who was willing to give you all of that information, I wouldn't be the kind of a man you would want". The answer is that if a man is too proud to give the information that is required of him to secure a position with opportunity, then he is too proud to do the kind of work that would enable him to reap the advantages accruing from that opportunity.

References are at once a necessity and a delusion. The persons whose names are supplied by a candidate, are usually ones who the candidate feels confident will give him a clean bill of health. Few men will give an unfavorable report of another in writing. Therefore whenever possible it is advisable to check up the references by personal visit. It is also very advisable to make inquiry of persons other than those whose names are supplied by the candidate. This is a simple matter if the applicant comes from a country town. It is not much more difficult if one gets in touch with all of the applicant's previous employers, and learns from them of his record and history. A single unfavorable or qualified statement is a danger signal and should be run down until the entire truth, either favorable or unfavorable, is learned.

Too many references cannot be written to. The writer recalls the case of a man who made a remarkable first impression, and yet there was something puzzling about him. Consequently twenty-five people were communicated with. Twenty-four of these wrote excellent letters. The twenty-fifth said "Send a man down to see me and I'll answer your questions". From the information that resulted, it appeared that the house narrowly escaped employing a man who would have been far from a credit to it. In another case, a candidate had been in the navy and gave as references an imposing array of Rear Admirals, Captains and Commanders. Many of the letters came back with the notation that the person written to was dead. When these were shown to the candidate he sadly and ingenuously remarked that they must have died since he left the navy. After this employee was dismissed for misconduct, the conclusion was reached that he knew they were dead in the beginning or he would not have given their names.

No reference is as good as the "sizing up" of a man by an experienced employer. Some applicants have honesty written all over them. In such cases the checking up is merely a matter of form. References are therefore a neces-

sity if one is in doubt, a delusion if not properly interpreted, or merely a formality when a man's character is stamped on his face.

CHAPTER VII

TRAINING MEN

As good food may be ruined in the cooking, so good sales material may be spoiled in the training, or if not absolutely spoiled, it may be wasted by not being developed in the manner and to the extent to which it is capable. The opposite extreme is that it may be overtrained and discouraged. Some years ago the writer used to follow the policy of keeping a man in the office for anywhere from one to three years doing routine work and learning all the details of the business from the bottom up. This practice was abandoned some time ago because it developed numerous disadvantages and was not found to be any more effective than other methods less tedious and calculated to produce quicker results.

Inside work as a temporary expedient must obviously consist of a clerical and statistical nature. By temperament a man who is good on details and systematic, is frequently lacking in sales ability and conversely, one who is bubbling over with energy and enthusiasm finds office work tedious and a drudgery. A tem-

porary clerk of the latter disposition can keep his superiors quite busy remedying his mistakes, and in an active organization where accuracy is a necessity and each day's work must be disposed of before the next day's begins, it is much less of a nerve strain to maintain an adequate and competent clerical force than it is to use the office as a training school for embryo salesmen.

The young fellow who starts in an office after graduating from college usually expects to make his education return abnormal dividends in a brief space of time. The kind of work he is capable of doing does not command a very remunerative compensation and when his salary increases come only once a year or so, and are modest in size, he is quite apt to become restive and long for bigger things. During his scholastic period he has probably acquired some more or less expensive habits without a restraining conception of the value of money. When thrown upon his own resources he finds his wants are greater than the wherewithal to supply them. Possibly too he has by this time found a soul mate and is ambitious to have his own home. This latter contingency is a more frequent handicap than is generally realized, for the impetuous youth

often has not the patience to establish even a limited earning power before assuming domestic responsibilities.

Influenced by one or more of these problems, more transitory than vital, and impatient to earn more money, the apprentice is apt to feel that his services are undervalued, that the opportunities were overstated and that he can better himself by making a change. This may be hastened by some competing house painting a glowing picture and holding out inducements, so that the original employer finds that he has spent his time and energy in vain.

An even greater loss is experienced when a house spends two or three years on preparatory training and then finds out that the object of their thought and work, after being started on his outside activities, is entirely unsuited for salesmanship and incapable of producing the returns that are expected of him; or else if he shows signs of sales instinct, has not the patience to develop them but thinks he sees greater opportunities in another territory or with another house and resigns his position just as he is beginning to secure results that will reimburse the employer for the expense involved in his training.

In developing groups of salesmen, the writer

has secured just as good if not better results by giving them a very superficial training consuming only from three to six weeks. This is done by prescribed reading, lectures, discussions, the study of files of sales letters, and the analysis of bond circulars. With this smattering of knowledge, the men are started out to work, and they soon learn that experience is the great teacher. No matter how carefully a man is coached in the office, he quickly discovers that the problems he first runs up against are the very ones that were not covered in his preparatory course. Unquestionably a month on the road gives a man more experience than six months in an office. Of course the prestige of the house must not be allowed to be damaged by inexperienced men, so it is advisable to break in new salesmen in the straight canvassing of lists of names, instead of starting them right out to interview bond buying banks, and old customers.

This method of training has two distinct advantages. If a particularly attractive but high priced candidate comes along he can be given a try out at a higher salary than would ordinarily be paid in the knowledge that developments will show very quickly whether or not he possesses the elements of ultimate success.

In the second place, a moderate priced man can be given more time to make good if his entire effort is devoted to productive work. For some years the writer has adhered pretty closely to an automatic stop-loss in the case of new salesmen by dispensing with the services of a medium priced man when his salary and expenses exceeded his sales profits by $500 and with those of a high priced man when his deficit reached $1,000. This rule however is interpreted more liberally in the case of a road man than in that of a city man on account of the expenses of the former accruing the more rapidly. Also it is waived where it is evident that a salesman has real ability and will unquestionably succeed if given time to overcome particularly difficult conditions. By way of illustration, one man in a virgin territory ran behind nearly six hundred dollars the first year but justified the confidence in him by returning profits of $15,000 the second and $30,000 the third year.

After a man makes good on missionary work it is fair to him and profitable to his employer to give him a developed territory as soon as one is vacant. Another recruit can then be started on the missionary work where the previous one left off. Up to a certain point the

matter of the relative value of different territories is not to be considered, for an incompetent salesman will be a failure in a rich and developed territory while his more competent confrere will be a success in a sparsely settled and undeveloped field. In the first instance, therefore, it is not a question of the territory but of the man, and the salesman who blames his territory for his poor results would better devote a little time to introspection; but as a salesman in a minor territory develops in ability and earning power, he can be transferred profitably to a major territory where the opportunities for profits are larger both for the house and for the man. This is the most logical and practical way to reward a salesman for good service and to promote him in recognition of results obtained.

It is much easier to point out why one man does not succeed as a salesman than it is to tell why another does. In a previous chapter some of the attributes of success were given. Here it is pertinent to name some of the causes of failure. They are mainly (1) conceit, (2) intemperance, (3) laziness, (4) inefficiency, (5) insincerity, (6) poor judgment, (7) excessive outside diversions, (8) domestic handicaps. One of the two faults first named can usually

be blamed when a promising career is blighted after it has begun to bear fruit. To the others can be traced the reasons why other careers never pass even the experimental stage.

More bond men have been spoiled by conceit than by anything else. Salesmanship is a business of comparatively quick results. When a young man attains prominence in the profession and a compensation large for his age and experience, without the years of training and devotion to detail that are required in other lines of business, he is apt to exaggerate his own ability and importance and to forget that a large part of his success is due to the reputation of his house, the quality of the goods it gives him to sell, the manner in which it backs up his efforts and finally to such fortuitous circumstances as may work in his favor through the nature of prevailing conditions. The result is that he places an abnormal valuation upon his services, and sacrifices his opportunities, just as they are about to yield him large returns, by becoming dissatisfied with his position, and making a new affiliation, or else in his over-confidence he rests on his laurels. In either event he loses his momentum, and slips back so far that he fails to recover it. To use a trite expression, it is difficult for a young man

to keep his head level when he enjoys too sudden prosperity. The ruinous effects of intemperance are now too generally recognized to require more than the mere statement that the bond business is not immune from them, and within the writer's knowledge more than one bright future has been obliterated by this evil, notwithstanding extreme precautions to avoid the employment of men so addicted.

Of all the numerous causes for either complete or partial failure in the initial stages, none is more prevalent than laziness or lack of application. The difficulty nowadays is to find men who will really work. Short cuts to the royal road to wealth are in great demand. Hard work is at a discount. Of the business virtues, the greatest is ability to work. A brilliant mind is too often housed in a lazy body; much better that a man possess an average mind and realize that application has to make up for him what he lacks in quick wit. Often the plugger gets the greatest results, for he does not sputter and miss fire but keeps at it with dogged determination. Brilliancy, personal charm, analytical ability and fluency of speech are all of secondary importance for there is no question but that in the selling game what a man accomplishes is in direct proportion to the effort he expends.

A salesman who interviews twenty investors a day will make twice as many sales as though he sees only ten in the same time. Systematic and sustained effort takes will power, and it is so much easier to do something more pleasurable that unless a salesman keeps a firm grip on himself he unconsciously "loafs on the job", and when this insidious habit is formed, it is very hard to throw off. Hard work then is the keynote of all the attributes of success.

Inefficiency—absence of ability to do a thing right, incompetency in little things, and shiftlessness in thought and action—is the greatest point of waste in the industrial machine. Of all the text books that have ever been written for this or any other business, not one can touch the "Message to Garcia" by Elbert Hubbard, and no one's education is complete if he has not read this. There are only two ways to do a thing—one the right way, the other the wrong way. How many the men who try to find a compromise between them! Half of an executive's nervous energy is consumed in counteracting and preventing the waste and errors of ordinary incompetency on the part of employees and subordinates. The man who can do a thing right without being told always makes a quick trip to the top of the ladder.

Insincerity is the foe to one's ability to inspire confidence, the greatest asset of a salesman. Poor judgment causes a man to do things that he would not otherwise do, or to omit doing things that he should do and it is the root of the majority of his mistakes. Too many outside diversions encroach upon one's time but more particularly upon his thought, for the brain of the successful salesman cannot stop working when the clock strikes five. And last but not least, a man's progress in business is influenced greatly by the kind of support and inspiration he receives from his family.

The real training of men is only begun in the trying out process. That is merely the first step, for the ultimate success of an organization depends upon how it is handled after it reaches the producing stage, which is the subject of the next chapter.

CHAPTER VIII

PERSONAL SALES MANAGEMENT

The productivity of any sales organization is mercurial in that it increases and decreases according to the ability and force of its head. It is susceptible to active stimulation and as quickly lapses into inertia when the pressure behind it is removed. Salesmen are temperamental and quickly absorb the optimism or the lassitude of their manager. Consequently close attention to the men and direct contact with them is essential at all times. A sales manager, to get large results, must inspire confidence in his subordinates, must be one of them and yet maintain an attitude of dignity, must be friendly and yet not familiar, must have force, originality, personality, driving power, unbounded optimism and a buoyant wholehearted disposition. He must direct, correct and discipline, but avoid being hypercritical, faultfinding or moody. He must be plainspoken and sincere, avoiding subterfuge and evasion. He must be able to warm up to his subject, and enthuse his men so that they in turn will communicate their enthusiasm to

their customers. This capacity to develop ardent teamwork, to arouse the men to a high pitch as often as occasion requires, and to keep them pulling steadily in the intervals, is the test of managerial ability and the determining factor in the distributing power of the bond house. In a large organization with multiple offices it is well nigh impossible for the various heads to know all of the salesmen, and this fact frequently causes a feeling to exist upon the part of the employees that they are ignored by the members of the firm, whereas the latter are often embarrassed at not knowing whom they should know and at their helplessness to correct the situation. As the connecting link, the sales manager should know each man individually, should be familiar with the conditions in his territory, should be able to recall his more important transactions and should always be on the alert to drop a happy remark whenever the opportunity presents. He must be able to make each man feel at home with him when alone or, when gathered together in meeting, should be able to address the men forcibly and magnetically, and last but not least he must have a thorough technical knowledge of the bond business, and enough originality to know how to apply it effectively. The reader may

remark that very few sales managers come up to these specifications. True, but there are very few live sales organizations, and where the one does not exist, the other cannot be found.

The sales manager must know the difficulties his men encounter, how they handle their customers, their personal troubles, their financial difficulties, their hopes and their aspirations. He must watch their progress without let-up, must know how they are working and how much. Each lead must be followed, every proposed or possible transaction considered and note taken of every call in the field. For this purpose, a report (preferably written on a filing card) of each interview is the most adequate means available. At one time the writer personally went over from four to five hundred of these reports a day, which in itself was no trivial task, until the pressure became so great that it had to be distributed among divisional sales managers.

Each day as intricate trades come up they must be discussed over the long distance telephone so the sales manager has to be at the beck and call of his men, for if the man in the field cannot consult the one in authority when necessity demands, the trade may fall through

and the interest of the salesman jeopardized. Whenever an important piece of financing requires immediate attention, the field men must be reached and their modus operandi outlined to them, and those who are quickest to grasp the significance of the operation and to put their plans into effect, secure the cream of the business. A man's earning power as a salesman is determined in no small measure by his ability to seize a sudden opportunity and to make the most of it, for while the steady day to day selling provides his bread and butter, it is usually the whirlwind work on new bond issues that buys his automobiles. As a matter of psychology also, if the customers can be stampeded they can be sold more quickly and with less effort than in any other way. The salesman who leaves his prospect with a promise from the latter that "he will think it over" need never worry about whether he should buy a Packard or a Pierce-Arrow. The real salesman is the one who can close his order at the time.

Team work and esprit de corps are augmented by daily sales letters from the house. These should contain financial news items pertaining to the issues being offered, comparisons with other securities and all possible data pertinent

to the business, for salesmen as a rule are not students and their information must be prepared for them and set before them in an appetizing manner. Furthermore, the supply of financial ammunition should be inexhaustible for they will absorb only a certain percentage of it, and the greater the amount furnished them, the greater the amount they will absorb. Also, what will interest one and be of assistance to him will be passed over unappreciated by another. A sales letter is like a newspaper in that different readers utilize or are benefited by different parts of it.

Many sales letters are merely collections of soporific financial verbiage. They abound in dry statistics and in general street gossip clipped from the Wall Street dailies. Such letters are about as enthusing as a coal stove without a fire in it. When a salesman in some upstate town several hundred miles from home, has been up early and late in all kinds of weather and worked hard all week without signing up an order, has slept on a hard bed and eaten unpalatable food, feels generally down in the mouth and has about come to the conclusion that the other business he might have gone into would have been much more productive, at such a time he does not want notes from the

home office telling him his faults, or sales letters that read like lessons in college algebra, but he wants encouragement and inspiration. The sales letter to be of any real use, must be personal and sympathetic, it must convey a spirit of confidence and of good cheer and must have an all pervading atmosphere of "now fellows, let's get together". It should illustrate in an interesting manner how the other man just closed a nice sale from what seemed a hopeless prospect, it should make the salesman in the backwoods town realize that he is right in touch with his office and that they are metaphorically slapping him on the back and telling him to "go to it", and it should start him out on his day's work with renewed confidence in himself and the firm determination to wire in a nice order before the day is over.

Perfunctory sales meetings have their limitations. They are of the most value when a new issue is to be offered and it is desired to post the men collectively on it. They accomplish a certain amount of good in coaching the men but as a method of instruction are probably not as efficient as a well written sales letter, simply because things are better understood and remembered when read. Trips over properties are more or less beneficial in the

early stages but after a man has made two or three of them their value to him decreases. Their two chief functions are (1) to give the salesmen an opportunity to get better acquainted with each other, and (2) to enable them to say to a customer "Mr. Jones, I have just been over that property and it is a wonder", for strange as it may seem a buyer seems to be more susceptible if a salesman can relate a few personal experiences, and can say in all truthfulness that he has just inspected a certain company and knows that it is there. In other words the personal side lights of the salesman frequently seem to have more effect than the cold material facts of a greater real importance, that are published authoritatively by the house back of the bond issue. Trips, however, are expensive and may cost as much as ½% to 1% of the par value of the bonds to be sold. Furthermore, since the composition of a sales force is changing all the time, it is a question whether the permanent benefit is proportionate to the expense.

As a method of encouraging good fellowship and building up a potent realization of the dynamic force of the organization, as well as being an educational institution, the writer has always been a great believer in business din-

ners, held not once or twice a year, but every month or six weeks, and attended by all the men working under a given office. These dinners should be informal and free from stiffness, but should not be allowed to degenerate into mere social gatherings. They should be devoted to talks and general discussions in which all can take part. The writer has always made it a practice to hold them in the evening when the men felt relaxed, and he has always endeavored to provide a programme that would hold the interest up to the last minute, and encourage the men to get into the spirit of the occasion. The picture of the business, the seriousness of it, the importance of each man to it and his wonderful opportunities are always kept in the forefront. This purpose has been carried out even to the placecards, a few of which are given here by way of illustration, and to emphasize a point of view in the handling of salesmen.* These little fables or parables, whichever they be called, are for the most part based upon actual occurrences within the writer's observation or upon his experience as a sales manager.

In handling salesmen collectively, whether in writing or orally, the writer has always endeavored to avoid a stilted manner even at the risk of using too many colloquialisms or resort-

*See pages 90 to 94 inclusive.

ing too much to slang, realizing from experience that it paid best not to be technical but to develop the punch and cooperation that was desired.

By keeping in close touch with each and every situation of every man through careful handling of his daily reports, by publishing

SALESMANSHIP vs. ORDER TAKING

THE ORDER TAKER follows the Path of Least Resistance. He shuns study, works by the clock, and is satisfied to live on the Crumbs that fall his way. He stays in a rut, Opportunity avoids him and he blames his luck, his territory, his firm and his associates for his Lack of Progress. He never rises above the low water mark of Mediocrity but always remains an Order Taker.

THE SALESMAN eats work and forgets time. He keeps posted on facts and conditions and knows whereof he speaks. He works for the joy of working and thrives on the Spirit of the Chase. His Optimism banishes discouragement, hard luck and disappointment. He is a Financial Adviser. He leads his customers and they follow. He grows day by day, Happiness is His and life is real. For the true Salesman, the sky is the limit.

MORAL: "There is more to the Bond Business than merely knowing the difference between Cost Price and Selling Price."

bullish sales letters and by bringing the men together frequently at the sales dinners, it has been found unnecessary to have the men come in off of the road every Saturday to report to the office, and what is thus saved in railroad fare, and in the work being less interrupted, very largely offsets the cost of the dinners and greatly increases the efficiency of the entire organization.

From the information given in this chapter it is seen that successful sales management is not only based on the technical side of business, but is largely a matter of the training and handling of men, and that these two latter are interdependent in that one can not be separated from the other. A sales organization is like a kaleidoscope. Its personnel is ever changing.

EFFICIENCY OF OPERATION

WE ONCE had a man who "sold bonds with his feet". For a while they "paid good dividends" but gradually through the entire Neglect of his Mental Upkeep and constant Decrease in his Street Mileage, the "dividends" were reduced and finally passed altogether. And then came the Scrap Heap.

Some Men are Active Physically and Lazy Mentally, others Active Mentally and Lazy Physically. One trait is as costly as the other. It takes the Maximum of both Thought and Energy to win Real Success. Anything less is a Waste of Opportunity.

Join the Movement for Bigger, Better and Brighter Salesmen. It's Worth While.

The men at the top must be kept satisfied and their producing power must be maintained, the men half way down the line must be encouraged to greater effort, and helped to reach the top, and such of those at the bottom as clearly show they can never rise above it, must give way to others to be tried out. The status of the organization is maintained only by being replenished constantly with new material, the best of which will push up through the rest and

help to keep up the standard, and the balance will seek its level.

The most discouraging and most trying feature of sales management is that an organization cannot be developed to a certain degree of efficiency, and then made to "stay fixed" but

DISTANCE LENDS ENCHANTMENT

A COUNTRY SALESMAN once asked to be transferred to the Metropolis where Investors were as thick as Flies, where good Bonds, to be Appreciated had but to be Seen, and One didn't have to be told how to Clip a Coupon; where the Agonizing Voice of the Call Boy was stilled and the Inexorable Itinerary unknown; and where, on every street corner, stood Opportunity and Fortune waiting to be approached by the gallant Bond Man.

A CITY SALESMAN, at the same time, tiring of the hard Paved Streets, longed for the Green Fields, the Trees and Running Brooks; for the Country where the Farmers "cashed in" the High Cost of Living and bought Automobiles and Bonds with equal Abandon; away from Noise, Confusion and Keen Competition, and where an Ounce of Eloquence outweighed a Ton of Knowledge and Information.

And Each, overlooking the Pot of Gold at his Feet, wanted to chase the Rainbow on the Horizon.

Moral: Every Other Fellow's Territory looks better than One's Own.

just as much thought and energy must be expended to maintain its efficiency as was required in the first place to create it. Only a very small proportion of men responds in the same degree as the impulse that is directed upon them. Probably it is well that they do not, or an organization might burst like a fly wheel from being run at too high a speed.

At last analysis, then, the success of any salesman depends first upon himself and second upon his house. The question has often come up how the credit for results obtained should be divided, assuming that the house and the quality of its goods be beyond criticism. The writer has usually answered the question this way:—In the case of a star salesman the

GAUGING THE CUSTOMER

A SALESMAN once lamented that no Customer of His could buy more than Five Bonds at a time. We replied this could not be so but that he was gazing at his territory through the Small End of the Telescope. It was evident he had either failed to locate the Big Ones or did not know how to "land" them, or else did not approach them in a Big Way.

We counseled him that if he would flatter their Vanity by talking Blocks of Twenty-five instead of depreciating their buying power and his own salesmanship by being satisfied with Ones and Twos, he would be surprised at the Result.

The Salesman was Wise, and took the Hint. The next week he reported three Ten Thousand Dollar Transactions.

Moral: A Customer is only as Big as the Man who sells him.

credit should go two thirds to the man and one third to the house, for such a salesman advances the house as well as himself; while in the case of an inferior salesman the credit should be divided two thirds to the house and one third to the salesman for such a man is pulled along by his house and thus retards its progress. Consequently it is not possible to work out any conclusive answer or final pro-

portions governing division of credit between the house and its employee.

The same thing applies to the time honored controversy between the buying department and the sales department. The buying department maintains that a thing well bought is half sold, and therefore it is entitled to the larger share of the credit. The sales department maintains that if a thing could not be sold, it

THE SPORT OF SALESMANSHIP

SOME SPORT is Work and some Work is Sport. Real Salesmanship is Work but it should also be real Sport. If you like to do a thing, it is Sport, if You dislike it, it is Work. The Successful Salesman likes his Work and he therefore gets Sport out of it. The Man who dislikes it, finds it Drudgery, and He is Unsuccessful.

If a Man is a Good Salesman, He is usually a Good Sport, and conversely, a Man who is a Good Sport is usually a Good Salesman.

Be a Good Salesman and a Good Sport.

could not be bought therefore the sales department deserves the honors. The writer does not profess to be competent to settle this much mooted question, but nevertheless he has usually found that the buying department could buy as much as the sales department could sell under normal conditions and therefore the work of the sales department was the more difficult and required the greater ingenuity. This is purely an academic question and is only cited

here by way of illustration simply because many salesmen reach a certain point in their careers where they take unto themselves too great credit for the results that their sales records show.

*CHAPTER IX

THE DEVELOPMENT OF THE BOND BUSINESS

The bond is an instrument of credit. The bond holder is a creditor. He loans his surplus wealth and receives thereon a fixed rental in the form of interest and a promise of repayment at a fixed time. So long as the covenants of the contract are complied with he has no control over the property securing his loan. However, if default is made in the terms of the contract the bond holder can theoretically take possession of the property for he has a claim upon it prior to any one not so secured. The stockholder, on the other hand, is the owner and operator of the property. After paying the interest and other fixed charges, he is entitled to the profits of operation or if the property be sold he is entitled to the proceeds of the sale over and above the claim of the bond holder.

The right of property or ownership goes back to the beginning of man. No doubt equally ancient is the institution of credit which is no more than the ability of one person

*See Introduction.

to borrow the property of another and to pay for the use thereof. Probably, in the Stone Age, debentures were inscribed on boulders. As property rights became more clearly defined and better safeguarded the instruments of credit became more specific and constantly afforded better protection until today we have the highly developed corporation mortgage. It is not my purpose to trace the history of property and credit for the subject is inexhaustible, nor do I even want to attempt to outline the early forms of bond issues for that is historical rather than practical and would require more study on my part than the importance of this particular phase of the subject warrants.

Going back, however, fifty years to the dark days of the Civil War, we find that the National Government had to borrow large sums of money at what would now seem to be exorbitant rates of interest. But when we realize the enormous destruction of property at that time, the great scarcity of gold, the much greater purchasing power of the gold dollar, the depreciated value of paper currency and finally the unstable condition of the Central Government, we can appreciate the risks that capital took and also the task that the bankers for the Government had on their hands. Fol-

lowing the close of the war and during the resulting unsettled conditions in the South, the "Carpet Baggers" took advantage of the situation and issued millions upon millions of dollars of municipal securities for which, in many cases, the municipalities received little or no benefit. This resulted in the era of repudiation that subsequently followed. Then came in the '70's the period of wild-cat railroad construction and over capitalization and the issuing of many millions of railroad bonds by over sanguine or loose managements.

All of these influences naturally more or less discredited the general class of bonds as safe investments and it is not surprising that the best municipalities and railroad corporations had to pay seven and eight per cent. for money and even now some of the old sixes are still outstanding.

It was with these conditions yet fresh in peoples' minds and with the laws restricting the creation of debt by cities and counties loose or defective, that the modern distributing banking houses began their uphill fight. In the '80's and even in the '90's there were long profits in municipals, but then it was some work to sell them. While the popular taste for Western municipals was being developed, the

larger trunk line railroads were developing and getting on a firmer foundation and their securities becoming better established. Then came the financing of gas and water companies, and of horse-car and cable lines and after that the building of electric light plants, and then in the '90's, the electrification and consolidation of the passenger railway lines, and after that the building of the interurbans. All the while, the steam railroads were pushing out and extending their systems and swallowing up other roads and double tracking, and building terminals, and issuing improvement mortgages, and purchase money mortgages and general mortgages.

While these things were going on, the country was becoming readjusted, and established on a solid foundation and wealth was increasing and people were saving money and investing it. And as one class of securities won the public confidence, the rates of interest for that class gradually fell and the investors sought another class to get a better yield, and so on from one class of bonds to another. And as each class of investments became established in peoples' confidence and it became easy to raise money for that class—over construction and over confidence and over capitalization

took place and so it has been through the ages and so it probably always will be. Recently this has been typified by the enormous development of holding companies, buying everything in sight and paying for it with preferred and common stocks, and by the flood of heavily capitalized industrials running the gamut of everything from locomotives and automobiles to five and ten cent stores.

Taking up the thread again, we find at the close of the last century the greatest industrial development that the country has ever witnessed. Trade was booming and everybody was making money and credit was expanding and bankers working overtime trying to manufacture securities fast enough to take care of the enormous investment demand. Money had never been so cheap before. New York Central 3½'s sold at 113¼. Cities like New York and Philadelphia were putting out 3's, and even some of the railroads of lesser importance put out 3's and 3½'s, though at a discount. 1899 to 1900 saw the climax of this movement and in 1901 the pendulum started in the other direction. From then until today with slight interruptions, there has been a steady decline and we are getting back again to a period of relatively high money rates. How far this

present movement will go, it is impossible to say, but the turn has to come some time for the pendulum cannot swing in one direction forever. Some people pretend to say that we will never see another 3% investment rate. That statement is, however, impossible to prove, but it will probably be many years before rates are so low again.

In 1901 the municipal bond business had seen its palmiest days as far as the banker was concerned. Steam railroad bonds were in high favor. Gas and water bonds were well established and fairly popular, but difficult to purchase on account of the scarcity of the issues. Street railway, electric light and power and hydro-electric securities had had their ups and downs and it required intelligent salesmanship to place them.

The past ten years however have seen the last named bonds steadily increase in popularity. With growing experience, bankers have learned how to separate the good from the bad, and how to safeguard the investor; also the constantly increasing cost of living and the continued declines in the prices of "rails" have forced home on bond buyers the advantage of properly secured "utilities". Likewise, the fact that public service companies supply public

necessities for which the demand is constant, insures a permanency of earning power which increases with the growth of population while steam railroads and industrials are more or less subject to general business conditions. Finally, the generally prosperous condition of the country over a long period of years has created a multitude of investors, and during the past few years the high-class magazines and periodicals and the educational work of bankers have taught the people the advantages of good bonds. The result is that never before in our history have public utility securities been so well regarded and so popular.

Before passing on to the next point in the discussion, it may not be amiss to read you an article which I contributed to the 1912 Annual Financial Review of the Public Ledger. It is as follows:

"Some people try to combine speculation with investment in buying bonds and, as a result, accomplish neither purpose. Theoretically, a bond is the safest form of investment. Obviously, therefore, it should have the smallest element of risk. That which has no risk has no speculative value. Conversely, anything that is speculative has risk. If you have a dollar, you can either invest it or you can specu-

late with it. No one dollar is big enough to do both kinds of work at the same time. This may sound elementary, but it is surprising how many people have not learned the lesson."

"There are hundreds of ways in which money can be risked with the hope of getting an abnormal return, but there is only one way in which to invest in bonds, and that is to put the point of safety above all others. If bonds are bought because they are safe, the buyers should be satisfied with a normal return and should expend his energies toward getting the greatest factor of safety commensurate with the rate of interest he must have."

"There are degrees of safety in investments, as in mechanics. A bridge need have only a reasonable margin over the greatest weight that can be placed upon it. Any greater factor than this is a waste of material. A security should have all the elements to make it safe beyond question, but it need not possess such a high degree of perfection that it becomes a luxury, for then it is a partial waste of investment capital. In other words, for the average investor, the most satisfactory bonds are not the low rate municipals or high-grade underlying rails, but properly selected public utilities yielding in the neighborhood of 5 per cent."

"The basis of sound investment is knowledge and experience, not the necessarily superficial information of the layman, but the specialized training of the most careful of investment bankers. Only through the broad experience of years, gained by financing a large number of securities under widely different conditions, is a firm qualified to make the rigid constructive investigation which will enable it to recommend to its customers an issue, with an assurance of permanent stability. It is the application of intelligent methods, derived from this thorough school of experience, that is the investor's safeguard, and an outline of a few of the lessons taught may not be amiss in this financial review."

"A few years ago the theory was that, to be choice, a bond had to be secured by a first mortgage, and a closed one, at that. However, the views of bankers have changed and the old idea of binding a company hand and foot has given way to the broader view of allowing more discretion to the management under proper restrictions. It is not a question of how much is ahead of a security, but of how much is behind it. Our country and its resources are developing rapidly, and the facilities required by the people must keep pace with the growth of population."

"It is impossible to anticipate corporate financing very far ahead. Consequently, if a mortgage is too closely limited in amount it is quickly outgrown and refinancing at advantageous terms may prove difficult. This is a disadvantage to the bondholder and may prove a drain upon the property securing his obligation. It is far better that a mortgage be made large enough to take care of the corporate necessities for years to come. The security holder can be amply protected by providing that bonds can be issued for only 80 per cent. of the actual cost of new property, and then only when gross earnings are five times and net earnings one and three-quarters times the fixed charges upon all bonds outstanding and proposed to be issued. An additional safeguard frequently employed is the creation through the mortgage of an annual maintenance and depreciation fund."

"The essential margin of net earnings over fixed charges depends upon conditions. One security requires more than another. The smaller the company, the larger should be the margin. Under normal conditions a ratio of two to one is ample. In the case of very large corporations, if the net is one and one-half times the fixed charges, this is usually suffi-

cient, as the earning power is less affected by outside conditions and the final surplus is sufficient to take care of unforeseen contingencies."

"Unfortunately, in many published statements the true earnings are disguised or cleverly arranged to give a wrong impression. The writer recalls one very prominent case where, under the caption of "operating and other expenses" were included the fixed charges on a very large amount of underlying bonds. This presumably was done to give the impression that the resulting net earnings were twice the fixed charges of the company, whereas the margin over the total fixed charges was dangerously narrow."

"This is an abuse that is common to many holding companies. Where a corporation controls a number of subsidiary companies and the earnings of the latter are carried forward into the parent company treasury, the income accounts of all the companies concerned should be closely scrutinized, and unless the total net earnings show a very comfortable margin over the total fixed charges, the parent company's bonds should be let alone, even though the carried forward surplus earnings of the subsidiary companies are two or three times the fixed charges on the parent company's bonds. This

is a matter of the greatest importance in buying corporation bonds, and a pad and pencil and a copy of a manual are an excellent precaution."

"Earnings are figured differently by different operators. One man will charge against capital account items which another man would properly charge against operation. One manager will pro-rate over a long period of years the expenses of contract solicitors, while another manager will charge this into the year during which the earnings were increased. The experienced investment house has analytical accountants who are competent to go into all the numerous matters of this character and make up their own statement of earnings from the company's books, for while few operators purposely create a wrong impression as to earning power, some draw the lines much less closely than others, and the complexion of a statement is frequently very much changed after it has undergone a rigid examination."

"The future growth and stability of a territory have a greater bearing on the permanence of an investment than the past successful operation of the company supplying it. It is better to buy the bonds of a corporation earning a relatively small margin over fixed charges, but

operating in a rapidly growing section, than it is to buy bonds of a company earning two or three times its interest, but operating in a stagnant or declining community. The character of the population and territory are also of great importance; likewise, the greater the diversity of business carried on by a corporation, the more stable its earnings. All one-industry communities, pleasure resort propositions and similar opportunities should be passed by."

"The physical or replacement value of a property is the cost of duplicating it in an equally good condition to accomplish the same amount of results with the same degree of efficiency. If money has been wastefully spent or property has been unnecessarily duplicated, the junk value of the plant, but not the replacement value, has been increased thereby. The physical value of a property should be considerably in excess of the total funded debt, otherwise an agitation for lower rates might reduce the earning power to a point where the margin of safety was impaired. Probably replacement value and earning power taken together are the two most important points to be considered in investigating the safety of a bond issue."

"There are experts and experts. The value of a physical, legal or accounting examination

depends entirely upon the ability and reliability of the man who makes it. The successful investment banker must know his experts thoroughly and be able to size up which one is best suited to make any particular examination."

"The influence of the personal equation must be eliminated by having the report made by the expert for the buyer and not by the expert for the seller, for no matter how honest and honorable a man may be, he is unconsciously influenced by the interests of his employer. Having secured the reports from the legal, engineering and accounting experts, these must be interpreted by the banker in accordance with his experience and his knowledge of conditions. He is the final concentrating force who harmonizes the divergent elements and welds them together in permanent financial stability."

"What makes a security marketable? Listing alone does not do it. It is supply and demand; and the demand for a security depends upon its intrinsic quality and upon its having been properly 'placed' in the first instance. A security that is weak in itself or has been handled by a weak house will not 'stay put'; likewise, even a good security, when not sold to ultimate buyers, but placed in large

blocks to institutions buying for a turn, will have a 'soft' market until thoroughly absorbed. On the other hand, when an issue of good bonds is entirely distributed to actual investment buyers, the market will take care of itself, for the normal demand will absorb any small amounts offered for sale. Listing a bond issue does not create buyers: it merely establishes a printed quotation and a convenient method for a seller and a previously created buyer to get together. Properly placing a bond issue in the beginning is of far more benefit to the holder than having it listed on an exchange. The responsible investment banker who does business on a large scale is in the best position to see that new issues are so placed that they will afterwards enjoy a ready market."

"Some investors believe only in municipals. Some only in railroads. Some only in utilities. This may be termed 'vertical classification' and is an absurdity. What the writer terms 'horizontal classification' is the safe principle. In other words, the best secured of the three kinds of bonds mentioned is a good investment. No one can say that all municipals are good, or that all railroads are good, or that all utilities are good; but the best of any of these is a good security and a good utility is far better than a poor municipal."

"To illustrate, it is the writer's experience that a good public utility paying 5 per cent. or less is better than any railroad or municipal yielding the same rate of income, and the average railroad paying 4¼ per cent. is better than the average municipal paying the same rate. Each security should be judged on its own merits and compared with its own class, and only the best of any class should be selected regardless of yield. If the best of one class does not yield enough, do not take a poorer bond in that class, but go to the best of the next class."

"These are a few of the points encountered in trying to arrive at a correct judgment in buying bonds. There are, however, many other things having a direct bearing on the situation. Each security presents its own complications. These require the most painstaking, thorough and experienced investigations. The layman has not the means, ability, opportunity or knowledge to do this, and even if he had, his relatively small investment would not justify the expense. Furthermore, the combined judgment of an organization of trained experts is better than the judgment of any one individual can possibly be."

"The proper kind of an investment banker

feels a deep responsibility toward his customers; not only the necessity of recommending to each person the kind of security best suited to his requirements, but the obligation to watch over that security and see that it is not impaired, and also if the customer desires to realize upon his investment, to see that he receives a fair market price for it."

"In the last analysis the subject of investments is so broad and it is so difficult to separate the wheat from the chaff and so few people are familiar with financial matters, that it is more important to investigate the banker than the security he is handling. If he has the reputation, gained by years of successful business, of giving every customer, whether large or small, a square deal; of handling only securities of the highest quality and of standing back of them, and of making a market at a fair price when a customer desires to sell, he is the man whose advice should be taken and the value of whose services should be appreciated."

Our aim and ever present ambition is:—

To sell bonds that are safe and which will always remain so.

To make new customers.

To keep the customers already made satisfied and make them strong advocates of our methods and our securities.

To build up an organization of clean self-reliant men.

To give everybody a fair and square deal, keeping the size of the dollar forever in the background.

To lift our work above the level of a worldly grind and make it a joy and an inspiration. Hard honest effort makes a clean mind, a healthy body and a cheerful spirit and brings results that compensate.

The house that tries to make all its profit on the first sale has a perpetual job hunting for victims. One dissatisfied customer can cost more business than will be made by two satisfied ones. Our success is dependent upon small profits, repeat sales and a large volume of business. For us there is no money in the first sale. We must demonstrate that our goods are of the highest possible quality. They must stand up under the test. Confidence is a plant of very slow growth and yields quickly to the frost of suspicion. In watching the work of various men over a period of years, I am satisfied that the primal quality of salesmanship is the ability to impress the prospective buyer with your sincerity. No matter what the standing of the house or the quality of the goods, if the salesman cannot inspire his customer with confidence in his trustworthiness and in his knowledge of his subject he is foredoomed to failure. The man who can be trusted, who knows his

business and who sells goods that are right in quality and price, need not worry about cut throat competition.

There is no question that our men are backed up in a way that is not excelled, and I doubt if it is anywhere nearly approached by any other house. We employ a class of men of the highest and cleanest type, we have a reputation that is beyond question, we are well and favorably known, we are "on the job", we are liberal in our treatment of both customers and employees, we protect our bondholders in a more than creditable manner and finally we handle a class of goods that has stood the rigorous test of time.

We do not claim to be the only good house in the business. We are not afraid of competition for "honest competition is the life of trade" and the more people we have educating the public, the more bond buyers there will be. Our greatest competitor is the "home investment", particularly the "local mortgage". Education and plenty of it is the antidote for this. Probably our worst handicap is the fact that in no other line of business is the buyer so ignorant of the quality of the goods he is buying or so helpless in distinguishing the good from the bad. Therefore, confidence is an abnormally

large factor in our relations with our customers. Also our trade is more apt to be saddled with goods of inferior quality at low prices bought from less reputable or less experienced houses.

Meeting competition successfully calls for plenty of tact and considerable psychology. No buyer wants to have his own shortcomings pointed out to him, nor does the world love a knocker. Do not dig up the weaknesses of your competitors' goods but speak well of the good points, and then pound home with every ounce of ability and energy you possess, the strong and incomparable points of your own security and boost your house. The average buyer is not analytical. Know all the facts about the bond you are selling, but do not swamp the customer with figures unless he invites them, and then be prepared to give him all the information he wants. Cultivate his confidence in you and in the house, and when you have won it, your competitor is going to have a hard task to displace you. Knowledge is power and confidence is three-quarters of the battle won.

*CHAPTER X

SALES METHODS AND AMMUNITION

In this series of talks a large number of essential facts regarding the investment business has no doubt been discussed and it is important that you should be familiar with as many of these as possible before attempting to sell bonds, but to attain any degree of success a salesman must have a good knowledge of the bonds he offers before approaching a prospect. A sale in this line of course is based upon confidence in either the house or the representative, but generally both. Therefore to inspire the confidence of the client by his knowledge of the offering, the representative should be able to discuss it without reference to his circular, as he will be more likely to hold his customer's attention and at the same time form an opinion of his peculiarities. As a means of mastering the important facts of our corporation issues I have found it helpful to make a brief analysis of each one. It will not only serve you as a quick reference, but will assist you in memorizing the important details of an issue in a logical

*See Introduction.

order. In making this analysis it should be paragraphed under different headings and brief enough to be typewritten upon one side of a sheet.

I have found the following form very convenient:

First: Name of bond, interest rate, maturity and interest dates.

Second: The capitalization. Showing the securities in the order in which they are a lien on the property. For instance, if the bond which you are offering is a first lien, list that first, and then the second lien, followed by the preferred and the common stocks.

Third: Territory. Give a brief outline of just where it is located, the population, the area served and the past growth of the district.

Fourth: Description of the property. State nature of same, capacity, or mileage if a railway.

Fifth: Equity over bonded debt. This may be arrived at in different ways, either by actual appraisal of the engineers, or upon the basis of the market value of the junior securities, or upon the earning basis. Some large operators claim certain properties are worth from seven to eight times their gross earnings.

Sixth: Earnings. Give a comparative state-

ment of gross earnings, for a period of years, and for the last or current year show also the net earnings, interest charges and balance.

Seventh: Franchises.

Eighth: General. Mention the fact if it is tax free or listed and the prospective growth of the territory, the holders if you are permitted to do so (such as institutions), the engineer's responsibility and something about the accounting certificate. More and more importance is being attached to the certificate of recognized public accountants, particularly by investors who have questioned the accuracy of earning statements submitted by many corporations in the past.

As additional ammunition or information, I would suggest that you familiarize yourself with the following arguments:

Bonds vs Stocks, Bonds vs Mortgages, Listed vs Unlisted Securities and Corporation vs Industrial, Railroad or Municipal Bonds. You will be asked many, many times to tell the advantages of one of these over the other.

One of you gentlemen asked me recently about the arrangement of a working list. You will find the card list convenient for larger towns and cities because it is possible to separate names in the different sections of the city

and carry only such as you may need. I am sure a book is more convenient, however, for a country territory. I use a loose leaf book, arranging the names alphabetically on the sheet and then arrange the sheets alphabetically according to town. Lists of bank directors are made on separate sheets inserted next to the index guides. If you have a large list use a separate loose leaf book for customers and their holdings. Arrange sheets in this book alphabetically according to name instead of towns. This will enable you to make any notations desired regarding disposition of securities held, traded or sold without lumbering up your list of names. It also affords a quick and convenient reference, particularly if you supplement this information with a cross index of our own corporation issues which have been sold in your territory.

The handling of a bank board is a problem of influencing men, but quite often one of influencing a man. I have found that the majority of boards are dominated by some one or two men. But before you get to the board you will encounter the cashier, or other active official in charge of the bank (and he is sometimes from Missouri). You will find some cashiers fairly well informed; but you will be surprised at the

ignorance of securities on the part of a large majority of bank officials.

The difficult man to handle is the constant grouch. He is found in every industry but there will be times when you will think they are all in the banking business. I recall an experience I had with a man of this kind which may interest you. The man I refer to was the cashier of a bank and had a very brusque manner. Although I had made many calls he never seemed to recognize me when I first went in. He would come to the window, look at my card and just about the time I began to discuss some offering he would walk over to his desk some distance from the window, sit down and begin to read or talk to some of the clerks in the bank. Of course that was extremely discourteous to say the least, and after several vain attempts to get his consideration of our house or our offerings I mentioned my experience to one of the directors for I knew they had bought bonds in the past. He admitted that the cashier was quite peculiar but intimated that without his (the cashier's) endorsement of an issue it would be useless to discuss it with the board. He told me, however, that at a previous meeting they had discussed some Pennsylvania 3½'s, 1915, which yielded at that time about

4½%. A few days later an issue of Pennsylvania equipments came out. I called the cashier up on the 'phone from a nearby town and told him I could offer some Pennsylvania Railroad equipments, and to my surprise he asked for some information; finally he said, "How many should I take?". I suggested not less than $15,000. He replied, "You can send me $10,000". Of course, this was unexpected. Next time I went over I received a more courteous reception and an opportunity to discuss corporation bonds with him. A short time afterwards I succeeded in having him come one evening to the hotel at which I stopped and spent a couple of hours with him. During this interview I learned considerable regarding the bank's holdings and some of their unfortunate investments which partly accounted for the cool reception he gave bond men. Next time we had a new corporation issue I called him on the 'phone and told him what we had and that I would like to file his order for $10,000, to which he finally agreed. Later we had another corporation issue of which I sold him $25,000. This is only another instance to prove that even the most obstinate men can be brought into line by persistence or a little ingenuity.

It is desirable to ascertain as early as pos-

sible the purchasing power of your banks. For instance, if it is the rule of an institution not to buy more than $10,000 of any one issue and they adhere to that very closely, it would of course be unwise to give them your best price on larger quantities. When bringing out a new issue it is usually customary to make a concession on blocks of $25,000 and over, and it is not advisable to mention this to smaller buyers unless you have good reasons to think the concession is sufficiently attractive to induce them to make an exception or increase their limit.

Orders offered by bank officials subject to the approval of the finance committee place the salesman in a peculiar position at times. It is desirable of course to have such an official at least committed in case there should be other offerings submitted to the board and yet if it is a listed issue or something which may be sold out before their meeting, the house may not be willing to fill the order at the price previously given. The committee in many banks will almost invariably approve such purchase but the house will often depend upon the salesman's knowledge of the situation and advice in accepting the conditional order, and it is a good policy when possible to ascertain at least the sentiment of the individual members of the

committee towards your bonds, particularly where you have had no previous dealings with the bank.

A little diplomacy is necessary at times in order to get permission to discuss offerings with the directors or finance committee. Some committees are more liberal than others with their time, and in many places where you or the house is fairly well known you will be given an advantage over leaving your circulars where, perhaps, they may become buried among those of competitors. You will find it advisable not to distribute circulars among members of the committee before you have discussed your offerings, for if you do, some will be looking at the map perhaps, while you are discussing the earnings, or at the possible water in the common stock while you dwell on the location, with the result that the force of your argument will be lost.

If you are not familiar with the preferences of the board I would suggest that you offer two or three issues. Mention first some well known bond, the security of which is unquestioned; that will often give a very good impression and perhaps avoid any prejudice at the beginning. This applies of course more particularly to some country banks having directors who are

not well posted. It is a mistake to offer too many different issues, and my experience is that three is sufficient except in special cases where a large amount will probably be purchased. You will find the cashier is generally interested in getting as high returns as possible while the board may give more attention to safety.

Discuss offerings with as little reference to your circulars as possible for you will then have an opportunity to size up the probable kickers and the talkers, and you are better able to hold their attention, and at the same time make your arguments more effective. Often times the cashier will turn over his circular in the meeting to the most influential man on the board and that information may be of value to you later. Draw out as many questions as you can before leaving the meeting, for if you can start a discussion it will give you an opportunity to overcome any individual prejudice or clear up any points which may have been covered too hastily or perhaps omitted. When questioned in the meeting about offerings of competitors, it is a good policy to say as little as possible for the competitor may have friends on the board who might be offended should you give too much information regarding something they had endorsed at a previous meeting.

You will be asked sometimes if any banks in the vicinity have purchased the issue you may be offering. In such cases it is advisable to simply say you must decline to discuss the holdings of any of your customers, because that is a confidence which you are not permitted to violate, and no one can take exception to your reply.

If the board is small it is sometimes possible to remain until action is taken and defend your case should there be any opposition. This privilege does not come very often however. Discourage if possible the discussion of anything foreign to the offerings you present. I know of one board where two of its members are of different political faith and they nearly always get started on politics while others become impatient and at times threaten to leave before any action is taken on investments.

In another instance, I was discussing some offerings with the cashier and finally asked him about the prospect of talking to the board when they met that day. He said he didn't know, but he was afraid the chances were not very good. He added that they had had a peculiar experience the week before. It was a comparatively new bank and some inexperienced bond man had been granted this privilege at their last

meeting and after making a few remarks about his bonds some questions were asked by the committee, but he did not seem very well posted and evaded most of them. He then endeavored to entertain the board by reciting some poems in Scotch dialect. Of course they were disgusted and were not inclined to admit any other bond men to talk to the board for some time afterwards.

The point of taking orders subject to a correspondent's approval has probably been discussed by others in this series of talks. However, I will add that if you know before the committee adjourns that this condition is to be placed on the order, you can often have it waived by going before them and stating that you will be very glad to have them refer any of our offerings to their correspondents, but they must realize that their correspondents have no engineering or other facilities for investigating the offerings of bond houses and that they do not know any more about the issue than what is told in the circular. Furthermore, they should put themselves in the position of their correspondent and imagine a customer coming in and requesting their approval of some bond he or she might wish to purchase. It is quite likely they would be reluctant to assume this

responsibility. What you should advise them to do would be to write and ask their correspondent something about the responsibility or reputation of your house and their past experience. You can then sometimes draw up a letter addressed to the correspondent for the cashier along those lines, which will serve their purpose and at the same time you avoid leaving the impression that you are afraid to have your offerings referred to the city bank.

In regard to calling special meetings, I might say that some banks have a finance committee which is composed of from three to five members. If you have something of sufficient importance it is often easy to have them call a special meeting, particularly when they meet only once a month. The point is if you really do have something that requires immediate action, don't hesitate to suggest this to the cashier anyway.

Personally, I don't think there is any great difference between the country investor and the city investor except perhaps in the number of bond men he may have calling on him. Some of the larger investors in the city are probably a little better posted; but anything which may be done or said to gain the confidence of the city investor would in my opinion apply to the

country investors. Give the client every reason to know that you consider his interest paramount in making recommendations to purchase or trade. Take advantage of every opportunity to impress him with the care exercised and the thoroughness of the investigations made by the house before an issue is bought.

In this connection I might add that you need not fear repetition, for some investors must be assured and reassured every time you call upon them. You should ascertain the degree of security and marketability which the particular prospect requires. A great many investors imagine they must have a listed bond and be able to see daily quotations in the papers. If this is not necessary they naturally sacrifice income or security for a degree of marketability that serves them no real purpose.

I think the state of mind of the salesman is contagious to a very great extent, and if he thoroughly believes in what he has to sell he will not only be more likely to effect a prospective sale but will at the same time (unconsciously perhaps) get a better hold on his client's confidence.

Last year the house offered one of the largest corporation issues which they ever handled.

One might have thought there would be sufficient bonds for everybody. For some reason, however, the impression seemed to prevail that such would not be the case and as a consequence we sold people who had never bought corporation bonds before. This was due I think to the fact that every man went after his customers with enthusiasm such as he had never had before and overcame every objection the investor could raise against the issue. We read considerable about the advantages of enthusiasm and some of us are born with it; some have it thrust upon them, but I am afraid most of us have it only intermittently. There are some very good little magazines published which I find contain some excellent articles likely to stir up a little extra energy when business is not exciting enough to keep up one's spirits.

You of course know the dangers of knocking bonds offered by competitors. It is a good plan to make comparisons when asked for information regarding a security which you know has certain weak points. Select some one of your own issues with which you are familiar and show the advantages of one over the other. By this means you avoid direct knocking and at the same time put in a good argument for your own bonds.

I once called upon a bank and the cashier told me they were seriously considering the purchase of $10,000 of a certain corporation bond offered by one of my competitors. I knew that some of their directors personally held blocks of the issue in question and that there was a strong probability they would approve the purchase of some for the bank. The cashier was kind enough to loan me his circular of the issue which was offered at 97. I then made a comparative statement with one of our corporation issues selling at 95. The nature of the product of the two companies was similar but our issue was decidedly stronger from standpoint of earnings, past growth, capitalization and other features, which advantage at first might not have been apparent to the directors on a casual observation of the circulars. After discussing our bond with the board, some one asked for an opinion of my competitor's offering. This gave me just the opportunity desired, and I laid before them the comparison which had been prepared in advance with the result that we secured the order. This incident also emphasizes the advantages of being in close touch with the cashier or at least one member of the board.

There is one feature I wish to mention

regarding the adjustment of interest charges in the profit and loss account of banks or institutions. I have offered bonds to banks at times when the cashier objected on the ground that he didn't like the interest dates. His objection would be based on the fact that there was too much accrued interest to pay and charge to his profit and loss account shortly before his dividend period. This would be brought up perhaps only by small institutions but instead of charging the accrued interest against his profit account, he should open an "interest paid account", which would be carried on the debit side of his ledger as an asset until the coupons matured, and by so doing his books would show the true condition of the bank and his interest and discount (or profit) account would not be affected by the purchase of such bonds.

The question of when to use the telephone can better be learned through experience. When you are sufficiently well acquainted with your customer to close a sale by telephone considerable time and expense may often be saved but you will remember also, it seems much easier for the client to say "No" over the telephone than it would be if you were present. I have made a considerable percentage of my sales this way at times when it was an impos-

sibility to see a man personally. You can also reach a man sometimes who may decline to grant you an interview. Under ordinary conditions, however, direct personal contact is the most efficient and the most productive method of salesmanship, and is the one which I would advise you to follow.

*CHAPTER XI

SELLING COUNTRY TRADE

Mr. Peirce has asked for a discussion of the topics "Selling Country Banks" and "Handling the Country Investor", as outlined in your memorandum, and I shall try to give you a review of the conditions as they have developed in my territory during the past few years.

The two topics specified really come under one heading. In other words, your country banks and your country trade are practically the same thing, for when you handle an institution, you handle not only the institution, but all the directors of that institution. In lots of cases the directors of such and such a bank that you sell, will also be your customers individually, and they are the men you should cater to and cultivate, to help you with the bank.

When you sell a country bank, you generally have to address the board, which as you all probably know, will consist of from five to fifteen or twenty members. As a rule the president or cashier and one or two or three of the directors pass on the offering, and the best plan

*See Introduction.

is to be especially close to those men who are really the controlling factor of that institution.

Before presenting an offering to a board, it is a foregone conclusion that the members of that board, as well as the cashier and president, know the house and think favorably of it as a bond house, or are acquainted personally with the representative, otherwise some education or information as to the standing of the house and the securities they handle, is first necessary, or the bank will want to make some inquiries, or refer all your offerings to their correspondent for approval. In this event if we are offering semi-active securities or ones that are not listed, the chances are nine out of ten that the trade will not go through, for the correspondent for lack of knowledge will not give them a favorable report, as it cannot take the time necessary to make a study of the various securities about which its country institutions make inquiry, and the consequence is that you lose out on the sale. Of course, when we are offering securities which are listed and have an active market, a favorable reply is usually received from the correspondent, and in cases of that kind where a bank likes a bond you are offering, you will generally get an order.

You must educate your directors and the

officers of an institution as to the standing of our house, and point out to them that much depends on the house. For instance, a country bank writes to a Philadelphia bank and asks about a bond we are offering, and the Philadelphia bank doesn't know anything about it; they may have heard about it, but they will not take much time to look it up; they will find out what little they can and say, "We do not think much of it" or something of the kind. If you educate your people and make them know that our house always investigates a proposition very thoroughly and that before we buy an issue it has to measure up to a certain standard, after a time you will have their confidence and sell on your initial offering.

Before presenting an offering to a board, you should know your subject very thoroughly. If you stand up before a board with a dozen members sitting around the table and make a speech telling all about the bond, they will probably want to ask some questions. You should have your answer right away and be familiar with your circular, know everything on your circular. Lots of times some member of the board will ask something about the replacement value or will ask what are the restrictions on issuing additional bonds. If you are not familiar with

that particular point, you should know where to turn to your circular to read that explanation to them. If you cannot do this, they are going to be a little wary, for they will think you are not posted as to what you are presenting and do not know your subject thoroughly. When presenting an offering to a board, you should have lots of information in addition to that shown on the circular, especially after you have once gotten your board interested. For instance, when we are going to bring out a new issue, the house will give us a four or five page memorandum, and on that will be many points that are not in the circulars, and if you make notes of those points and use them as a final argument before you are through addressing your board, they will invariably be very convincing. To my knowledge we have never yet put out an issue that we didn't have what we call "an advance memorandum". This will give you plenty of information, in addition to that on the circular.

The board does not necessarily always pass on your offering. The president or the cashier may control the situation, and in cases like that you must always go to the president or the cashier first and personally make your offering to him and practically get his approval before

you talk to the board, and in those cases a strong talk to your board is not necessary; just give a general outline of the specific security, and then the president or the cashier will give them any further information they want; after which you will be excused, but you should wait outside in case any questions come up which they want answered. In other cases, where the board considers an offering and must pass on a purchase unanimously, be prepared to give them complete data on your offering and after explaining it in detail, inform them that you are ready for questions and will cover more fully any points they do not understand, or any other points you did not mention, about which they may wish some information. If there are no questions forthcoming, and in nine out of ten cases no one will ask any questions, your best point is to ask Mr. So-and-So for instance, a man whose influence goes a long way, whether he has any questions, but beforehand you should have acquainted Mr. So-and-So with the issue that you have presented to the board; invariably the man that you ask the question of will say there is nothing further he wants to know, and that has a great deal of influence with the board. If the party whom you address does not ask any questions, you can feel pretty well assured of an order.

It is always a good idea to get to a town, especially in the country, an hour or so before the board meeting. You may have a new offering with which they are not acquainted, and if you are there early enough you can have a talk with a few of the directors, see the cashier or president or some influential member of the board, and acquaint him fully with the facts of your offering.

In one of the banks up State I had addressed the board from time to time without success. I finally found out the cashier was looking for a commission. The cashier would always tell me they didn't have any money but would buy as soon as they had funds. I was very friendly with two or three members of the board and really had an order from this bank for ten bonds of a certain issue then selling at 94 or 95 now selling at 101. We had the order on our books but they never wrote in to ship the bonds so the transaction was never closed, due to the fact that the cashier was not offered a commission. The next time I had a chance to do business with them was on an offering of another new issue. After addressing the board I waited around until they had adjourned. The cashier called me over and said, "We are going to buy some of those bonds, but cannot buy them now

as we do not have any surplus funds." After leaving the bank I walked over to get my trolley, and while standing there two directors with whom I had gotten very well acquainted came over and said, "Did you fix that up with our cashier?". I said, "Fix up what"?, and then they told me the board had passed a resolution asking us to give them an option on ten bonds until their next meeting. They did not have the money, but they wanted an option on these ten bonds for a week, as they expected funds within that time. I told them the cashier didn't ask for anything of the kind. That made them pretty hot and immediately they got busy and called the entire board together again. I went in to their board meeting again, the cashier being present, with the result that they gave me an order for ten bonds, delivery within thirty days. That opened their eyes and they had the assistant cashier check up their files, and found that the cashier had been getting a commission on everything sold to the bank. The result was he lost his job the following 31st of December. They have a new cashier now and we have sold them probably seventy or eighty thousand dollars worth of bonds since. That was a little over a year ago, and they have since proven to be very good cus-

tomers, and the new cashier will write in whenever he has a customer in the market and say, "What have you to offer for a customer of ours who has so much to invest?".

Another experience I had with an institution —an old one and a very good bank. They have about $100,000 capital, over $100,000 surplus and deposits of $700,000 or $800,000. I called there regularly and became very well acquainted with the president of the bank and knew the cashier very well too. Every time I went in there for three years straight, I got exactly the same answer, "We are not buying bonds; we do not buy bonds, and we do not consider them." A little over a year ago they met with some pretty heavy losses in commercial paper, with the result that they decided to buy a few bonds. Fortunately I happened to be on the job and knew they were in the market. The first order, I think, was for only five bonds, but they have purchased since that time about sixty thousand dollars worth of securities, and I have sold them practically everything we have brought out for the last year or so. I have done about $40,000 worth of this business out of the total of $60,000.

You may call on a bank time after time with the same answer, "that they do not buy bonds".

Do not let this discourage you, especially in a town where you go regularly to call on other institutions or individual investors, for it takes only a few minutes to stop in a bank and have a chat with the cashier or president of such an institution, especially when they are not interested; but some day that institution is going to buy, and that is the time you should be on the job. It pays to keep after an institution of that kind, because they will be a customer sooner or later, and when they do buy it will be from the man who has been the most persistent, and especially the representative of a house like ours. Since then I have sold the president, three of their directors, and three or four of their customers, and I have probably gotten seventy to seventy-five thousand dollars worth of business out of that institution. Not long ago the president told me they had two very good customers who up to the present time had been buying real estate, that is, local real estate such as farms in the community. He said, "Some of these days before long they are going to buy bonds, and when they do buy bonds I want you to get the business". He even went so far as to take me to the office of one of these men, a man making from fifty to sixty thousand dollars a year, introduced me to him and

said, "When you are ready to buy bonds, the house this man represents are the people to buy from". The first of April I was in the bank, not to make them an offering for they were busy, but to check up on something else, another trade I had pending; I wanted to see the president and after I was through with him the cashier said "I want to see you a minute". He was talking to one of their customers at the window; I went over and he said, "This gentleman has a couple of thousand dollars to invest and also has some friends who want to make some investments." He said, "Take him back in the private office and talk to him", which I did and found out that he had a couple of thousand dollars and the rest of the family had forty-five hundred. While talking with him the cashier came back and said, "Whatever this salesman recommends is all right; you can take his word for it". I didn't sell him, but will later on. This is just one of a number of similar experiences, and lots of this kind of work is necessary in order to develop new sources of business.

Another bank generally buys from one of our competitors,—that is, the board prefers their bonds. The cashier is friendly to our house, a good friend of mine, always treats me very

nicely, and I have sold the bank three times. I had an experience a few months ago with this institution; being in town one morning to see an individual, I stopped in the bank the first thing and asked whether they were in the market, getting the answer that they didn't have any money. I made an offering of railway bonds on which we had reduced the price from 98 to 97; the cashier seemed to like them but was not very enthusiastic, for the reason, I presumed, that he claimed not to have the money. I found that they held a gas issue due in July of this year, and I suggested that they make a trade on those; the cashier seemed to think that a pretty good proposition, and asked if we could pay 100¼ for them. I saw a couple of the directors, one a customer of the house, then attended their board meeting. I didn't expect to get any business; the cashier called me in and asked me to make the offering of our bonds to their board, which I did, with the result that they gave me an order for five thousand for cash. I was down town after the board meeting and one of the directors came along and said "That was very good work of yours". I said, "Is that so, how do you mean"? He said, "We had made a purchase of five bonds from your competitor at last Tuesday's meet-

ing, and were just awaiting the confirmation of our order before we had them shipped from New York". This experience shows how changeable a board may be from one meeting until the next, and how necessary it is to be on the job when you have a trade pending.

Lots of times you will get a new name on an inquiry, a private investor who will have from thirty to fifty thousand dollars to invest, maybe only five or ten. You will get that business, and he probably will not have any other money for one, two or three years. Just because he is not going to have any more money, and just because he is not going to do additional business in the near future, it does not pay to let him get away from you. Call on him, keep in close touch with him, and know what he is doing. You cannot afford to give up his business and discontinue your calls, for a competitor is sure to get acquainted with your customer and benefit by your hard work.

Sometimes you will call on a man and he will tell you he hasn't any money to invest; you can sit down and talk with him along general lines and after a while he will say, "Go down and see Mr. So-and-So; he has some money", and he will probably allow you to use his name. In half the cases, he will make the call with you

and introduce you, say you represent a good house, that you handle good bonds, etc. Always ask him before you go to see this certain party whether he objects to his name being used. He will invariably say no.

I have one customer whose name was secured through a financial paper, by whom we were recommended very highly. This customer is a woman and had at that time about forty-five or fifty thousand dollars. A predecessor salesman of ours was the first to call on her and sold her twenty bonds on the first interview; she didn't have the money, but took them up within a reasonable time. I kept after her and also sold her. She will not have any more money now until some member of the family dies but fortunately she likes to make a trade, and if I have a good proposition I can generally work one out with her. It is not always necessary to make it a personal interview, either. A letter from the house followed by a telephone call the afternoon after she has gotten the letter generally brings the answer yes or no, and it has never been "no" in her case. In this case, the house was already favorably known to this prospective customer before our salesman called, but in order to "cinch" the future business, a general education developing her confidence in the house was necessary.

An institution which is only about two years old has proven to be a very good customer. A number of the fellows pass that institution by because it is so small; they called upon it at the first meeting and as they did not get any business they thought it was too small to bother with and a number of them haven't been back. We had originally had an inquiry from one of the directors who had heard favorably of our house, and he wrote in telling us that such and such a bank was going to buy the next week. I went to see the cashier and found only one other man on the job. I made a number of offerings to the cashier and it looked as though I would get their business,—between ten and twelve thousand dollars worth. That was on Friday; I followed that up by going to see the director who had written in to us and acquainted him with the facts of the offerings I had made to the cashier. They met at 7.30 on Monday morning, so I had to go out Sunday night. I went to Lancaster and left there the next morning on the 6.40 train, thinking of course I would be the only bond man on the train and that our house and the other one would divide the business. When I boarded the train I saw another salesman sitting there. I said "I guess we are going to the same place,

aren't we?" He said, "Yes". This bank is located in a town of a couple of hundred people and there were six other bond men and three adding machine men who were going to call on this institution; think of it, at 7.30 in the morning. We sat around for two and a half hours and by nine o'clock they were ready to hear the adding machine men. At ten o'clock they started to call the bond men and heard every one of the representatives of eight different banking houses. The business was finally divided between ourselves and one other house; we secured $6,000 worth of business and the other house $5,000. Just because an institution is small, it doesn't mean that it is not worth following. This is an easy town to reach and I can stop off between trains and spend an hour there very easily. I have sold that bank practically everything we have brought out in the last two years, if not for cash, on a trade. It is a nice little institution to count on for one or two thousand of everything, and they seem to appreciate the fact that I give them so much attention and always consider them on advance offerings.

When I was talking about not following up the business that you have already gotten, I wanted to bring out the fact that if you do not

follow it up some other man will profit by your hard work. I had my lesson by experience. It never pays to forget you have sold a party, because he will be of assistance to you in getting business at some future time. Whenever you are talking to a bank and they say they are not in the market, always ask them whether they have a customer who is in the market for securities or whether they have any customers who have been inquiring about investments. Always ask the cashier or president whether any of their customers are in the market for anything. They will often say, "Yes, So-and-So is in the market", in which case they will give you the address of the prospective customer, and of course you will refer the client to the cashier or president, should he want further information regarding our house or our securities. In cases of this kind, you do not very often make a mistake by offering the bank a commission; tell them also that you are depending on them for some of that class of business. It is not hard to get when it is once started.

In some cases you will find the purchase is not always up to the board to decide. I have another institution to which we have sold a great many bonds, and it took me a long while to find out that the cashier and the president

were the whole show. In other words, every time I had a new offering I would ask permission to present the same to their board, which request was usually granted, but never resulted in an order. I eventually found out the best time to get their business was just after the board had adjourned, and that it was necessary to see only the cashier and president, for they always passed on any purchases for the institution, and they did not seem to want their board to have any say as to what they should or should not buy. It seems the president is a controlling factor in the bank, he and his family having a controlling interest in the stock, but this is a fact which it took some time to find out.

I have another very valuable customer who has absolute confidence in our house and purchases everything from us. He also is very influential in the community where he lives and always refers his friends to us when they want advice on investments to us. Only the other day he gave me the name of one of his friends and I took an order from her subject to the approval of her brother whose funds she was investing. This shows the confidence she had in this man. Of course he showed his confidence in us by recommending our bonds.

In a lot of country towns you will find fellows who are not bond buyers, but are talkers. They can tell you the history of everybody in the town, who owns real estate, where he gets his money, how much he is worth, and all information of that kind. That fellow is not worth a rap as a customer, but he gives you a lot of information that is valuable, and he is worth keeping on your list.

You will find it well to study local market conditions in all your towns, for it means many a trade. You will run up against different bonds in different towns and if you know the market on the local issues you can come back at your man right away, with a trade proposition on such local holdings.

The first thing when you start out on the road is to feel that our house is the best and most careful house in the business in the selection of the securities they purchase and recommend to their clients. Confidence in our firm and the securities they give us to sell is absolutely essential, and without such confidence you cannot sell our bonds successfully. This confidence grows and grows, and the longer you are with the house the more confidence you will have.

*CHAPTER XII

THE PERSONAL SIDE OF SELLING

I am going to talk today on what we might call personality in the bond business. You men have listened to a great many important points. You have heard of the history of the development of the bond business, the organization of national banks, circulation, the national bank act has been explained to you, the recent postal savings bank act, the law governing trust company reserves, customs of the street, etc. All of this of course is vital to a bond salesman; it is the foundation stone on which you are going to build your future; there is no doubt about that. These technical details you will have to brush up on from time to time, because you will be asked every day of your lives some point or another that it would be a mistake for you not to know how to answer, and they have been practically all covered in this list we have here; I do not think Mr. Peirce has omitted any of the important things that a bond salesman should have at his fingers' ends, and where you are going to have

*See Introduction.

a big advantage is in having these lectures reported so that you can look over them from time to time. I think every few months you should brush up on these talks; I know I wish I had had this opportunity; at times like the present, when things are so dull, and there is practically no business, it would help lots and be great encouragement to read over these lectures, that one wouldn't find time to read at other times.

I said we were going to talk on the personal side of the business; I mean by this the handling of the man on the other side of the counter. All this information and learning will not do much good unless you are able to make the other man see it, and see it your way. I have never been a salesman for any other kind of a house than a banking house and for no house but ours, so I do not know much about other kinds of business, but I do know that a bond salesman is the highest type of all salesmen, just as the bond business ranks first in the business world; this is beyond any doubt. You are not selling wool, or coal or steel; you are selling credit, and you will find that your customers, you who have been selling merchandise, will take you much more into their confidence, talk to you more as they talk to their

lawyer or to the man who is advising them on business matters, and for that reason you have to know how to handle them right from the beginning; if you make a bad start it is pretty hard to "come back".

Selling in Philadelphia as I have done for the past five years, my experiences will of course be on city trade. I think Pennsylvania has been blessed with possibly the two hardest bond cities in the Union, from what I have experienced and from what I have heard, both however from different standpoints,—I mean Pittsburgh and Philadelphia. The Pittsburgher has made his money in a hurry and he is inclined to be more or less speculative. The mine owners and steel operators have had an easier time in Pittsburgh in floating their stock and bond issues than in a good many other large cities.

Philadelphia is just the opposite; it is probably the most conservative of all the cities. The rich men of Philadelphia are mostly from the so-called "old families", old Quaker stock, and they are buying bonds today from the same houses that their great grandfathers bought from. They are hard for that reason to wean away, but there is an obstacle in every city and an obstacle with every customer; so that it is not right to say, I suppose, that one city is

any harder than another or that you are up against a harder proposition than the other fellow is, because you can hear tales of woe from everywhere. I have heard men who have been selling bonds in the country among the farmers and in the small towns say that when they came to the city they found a great deal of trouble in their path; they would say that they could not get in long enough to talk to the investor. You will find among the big buyers here in Philadelphia sometimes seven or eight bond men in line waiting to see a customer. If you should see him he can't give you the time that the man in the country can give you; he is a busier man and is bothered more; so your competition in the city is keener than it is in the country; on the other hand, there are probably just as many obstacles to be encountered in the country, as the country men have told you.

In selling banks and insurance companies the first and most important thing in my mind, is to locate the man who is the "boss". There are bond salesmen in Philadelphia today that I know have been trying to sell certain institutions for at least two or three years; they have been calling on one man in the institution all of that time, and he has no more to do with the

buying of the bonds than you or I have. With a trust company the best man to start with is the treasurer, because if he is not the actual buyer he often has a great deal to say about the bank purchases. I remember one institution here in Philadelphia where I called on the treasurer for probably three or four months, and by drawing him out by a number of questions I finally discovered he was not the man at all. He was not willing to say that he was not the man, as he wanted me to think that he had as much to do with that institution as anybody else. After one or two leading questions, however, he mentioned one or two names that were connected with the institution and these men he said had something to do with the buying. So I immediately made for them and finally discovered that one of them who was very seldom at the bank did all the buying, and through him I sold probably more bonds than any other salesman has sold since to that institution.

I find that young institutions that are just starting out are really meat for the bond man. You want to get after them in a hurry. As soon as you hear of any new bank that is starting in business learn the names of the officials, find out who is putting up the money, and start

some missionary work around among those interested.

I remember a few years ago one of our trust companies just opening up, had a board of directors and officers that knew little or nothing about bonds. I started calling on them but they gave me no encouragement; finally we did get to talking securities, and they said "We won't buy anything here but railroad bonds; that is all we believe in and we think that is the best investment; we have heard so and so". I agreed with them that rails were a first-class investment; I told them that a great many of the banks held such securities. We had sold a great many of them, but at the same time they were also big buyers of public utility bonds. Our interviews often drifted along the line of the different public utility bonds that our house had sold; I mailed them a little data from time to time such as our last piece of literature for instance. The result was that two years after that bank started we sold them a block of fifteen corporation bonds; we have sold them $150,000 corporation bonds since then, as well as a number of "rails", but the pretty part of the story is that they hold no public service issues but ours.

You will often have an official of an institu-

tion tell you that there is no use in calling on them; they will try to get rid of you in so many ways. I have heard a number of bond salesmen refer to certain institutions as impossible to do business with, and they would not call there because so and so was on the board. I can only say that it is best to pay no attention at all to any remarks of that kind, because we have sold institutions securities right over the heads of the members of the board of directors. If you know that a bank is in the market for bonds never let them alone, no matter what they tell you.

I recall so vividly the second sale I made in the bond business. One institution in Philadelphia had bid on $50,000 City of Philadelphia bonds; it was printed in the papers and I knew they were unsuccessful bidders and didn't get the bonds. Mr. Peirce said, "There is a bank with $50,000; go after them". The next morning I was in the bank before the president arrived; I greeted him when he came in and he told me in a very gruff way they were not in the market at all. I reminded him of his bid. He said they wanted those city bonds but did not get them, and it was of no use to call, that there was no chance of doing any business; he was very gruff and very disagreeable. I had

only been in the business about four months, and it may be some encouragement to you to know that it took me over four months to make my second sale in the business. I came back and reported to the office. Mr. Peirce said, "They have the money; they are going to buy somewhere". I had found out he hadn't bought city bonds anywhere else, and that he wouldn't pay the price he would have to pay to get them. At the time we were able to offer him City of Altoona 4's, a very good Pennsylvania issue that would net him the return that he wanted, the return he would have secured had he gotten the City of Philadelphia bonds he bid on.

Early the next day I was down at the bank again before he came in; you must always have some pretty good excuse to give for coming back so soon; I had gotten some further data on this issue which I brought down and hoped that he would look over it; he wouldn't even take the paper from me; he said there was nothing to it, that he didn't want any bonds. I said, "Won't you take this article and when you have a spare moment look over it?". He threw it down on his desk. I wanted to sit down but I was afraid to. I came back and reported my second interview. Mr. Peirce said,

"Do you want to go back this afternoon or tomorrow morning?". I didn't want to go back at all. He said, "You have to go back". (This is all true, you will run across cases just like this.) I wouldn't have to be told to go back now.

The third day I went back again in the afternoon. I thought probably after dinner my friend the president might feel a little better. He was reading a letter. When he saw who it was he started to finish his letter. I simply sat there. After a while he said, "Didn't I tell you not to come up here again?". I said, "I am sorry, but I thought you would change your mind and read this data we have given you." I asked him if he didn't think the bonds were cheap; I tried to draw him out, but when I wanted to press him further he drew back into his shell again, and I had to come back to the office, with the result that I was chased back again the next morning. This time I waited outside on the steps and greeted old Mr. Grouch coming up. I took my hat off and put out my arm to shake hands—you can imagine how much he shook hands with me; I followed him right into the bank and waited until he got his hat and coat off. I said, "Mr. So-and-So, this is to be my last interview with you; these

bonds are practically sold and if you want them, now is the time, and if you do not, I won't come back again until we have something else; these bonds will be gone and I know I haven't anything else now that can touch them for quality and yield, and I may not have anything for some months; there is nothing on the street that can compare with them, and if you want them you had better take them. This is final". He looked at me and said, "How much did you say they were"? I told him. He said, "How many have you"? I told him. He said "I will take them". Well, I nearly dropped dead. I took out a slip and entered the amount so that he could sign the order he was giving; my instructions were to get orders signed; he looked at me. I said "I want you to sign this". He said, 'I never sign those things". I said, "It is a rule of our house that orders have to be signed". So he signed it.

Well, to make a long story short, within three months that fellow was digging down into his desk every time I came up there to show me something he had written in his boyhood days, some speeches he had made at graduation exercises or something of that kind. I couldn't get away from him, and when I was

leaving he would walk out to the door with me and shake hands with me with a fond farewell. If he happened to be going out he would say, "Wait, I will go down in the car with you". Now here was a man I myself would have let alone if I hadn't been urged by an insistent manager to go after him, and I think nineteen out of twenty bond men would have been like myself. But they are the men you will sell bonds to and make the best friends of. Haunt a man when you know he has money. Mr. Peirce more than I realized that he had the money and that somebody was bound to get it. Somebody had to get it and the man that could stick the longest was going to get it, and in this case he did.

Among your trust companies never forget that they have funds to invest from time to time for reserve purposes. They may not be buying bonds for their general investment account; they may be putting their money into mortgages or putting it out in building operations, but if they are going ahead, and the young institutions particularly are going to be forging ahead, they must invest their reserve, and so many bond men do not know that a bank has money for reserve purposes until an official calls up the house and says, "What have

you in the way of municipals"? You will lose quite a little business if you don't watch this. Make it a point to get the names of the members of the finance committee or directors. It is easy to look them up in the small towns; you can find out in a very short time who are the important ones; you will often find that a couple of the directors buy bonds themselves, and at the same time you are finding out who are the men at those board meetings that are influential when it comes to buying bonds. You can often make a good point for yourself by being close to them when they come to buy bonds for the institution.

The other day a banker telephoned in, the treasurer of an institution that we sell, and said "I want to buy a couple of bonds for one of the members of our board of directors". We confirmed the sale. He said, "Just send the bonds out to the bank". I knew the official pretty well, but I hadn't sold any of the directors before; I didn't know there were any bond buyers on the board. He gave me this one's name. Where you can, when a sale is made that way through the bank, do your best to find out the name of the man that the bonds are going to. As a rule the official will tell you; he will certainly tell you after you are close to him.

I think an experience I had with one of the big companies here will help you on the point of finding out who the right man in the institution is. The company was just forming; the president was well known in Philadelphia; they had temporary offices in one of our office buildings and the president was there every day. I called about five times in a week, but could never get beyond his private secretary. You want to cultivate the private secretary. This one was a very agreeable girl and after about the fifth interview I said, "Would you mind telling me whether Mr. So-and-So is ever going to see me"? She said "What do you want to see him about"? I said "I want to see him about buying securities for this new institution; they have a good bit of capital to invest and I would like to do some of the investing". She said "You are barking up the wrong tree". If I hadn't gone at her in that way I would probably still be chasing up this one particular individual, who was the only well known man in connection with the company, and I would probably never have gotten him; or he might have put me off by saying, "We are not buying just now".

The man who is not doing the buying often won't give the name of the man who is; he

knows he is bothered to death. In this case the girl was very friendly and told me to go down to a grocer a few squares away; she told me that he was going to have charge of the bond buying and that he would very likely be the treasurer. (Every day this girl turned me down I had made it a point to hang around and engaged her in conversation, with the result that I finally got this valuable information). I went down to see the grocer. He said "Who told you to come here"? I said "I want to sell you for the institution, and thought probably you wanted to buy some bonds yourself". I didn't imagine he was a bond buyer, but it doesn't hurt to flatter a man like that. He said, "What is your story"? I knew they were investing their capital and that it would be in municipal bonds. I had a lot of papers and data and sat down and started to talk to him. He went on attending to his grocery business, and I never let up except when he was talking on the 'phone. He finally turned to me and said "What you are telling me is going in one ear and out the other; go back and write me about that".

I wrote him that day. The next day I wrote him again. I called again and asked him if he had read my letters; he said he had but

they were not interested. I started something else; he told me the same thing "That is going in one ear and out the other; go back and write it." I kept that up for about five interviews. I finally asked him if he had any of those letters. He said, "I have a lot of stuff piled up here". As a rule the big investors will allow a lot of papers to accumulate and if you are not careful the whole business goes in the scrap basket. He said "You are not as obnoxious as some of these fellows, are you"? I said "I try not to be obnoxious". He was crude, and I was standing for it; I have stood for worse things since. Finally he brought some other fellow's offering out. He asked me if I knew anything about it. I thought "Well, that fellow's bonds have made a dent, and I think I ought to be able to do the same with some of our offerings". I compared the offerings with some offerings we had talked about, and the result was that he signed an order that afternoon for $25,000 of bonds.

We then sold him all told probably $125,000 bonds and I have sold him personally the only bonds he has ever bought in his life. There was the man who said "What you are telling me is going in one ear and out the other". I knew he had money; that was my cue; don't let up

on the man with cash. Be as nice and as gracious as you can, but don't be easy. If they won't talk about bonds, talk about something else. More bond men fall by the wayside—and I would like to have a dollar for every man that falls by the wayside in a year—more bond men fall by the wayside because they haven't the necessary push. When a buyer has the money, stick. You will usually get some of it, you are bound to get some of it. If you know he has it, keep after him every day. Of course, once in a while you will lose out.

I had an experience this week. A man had $5,000 to invest that I have been after for a month; he has been a month looking around. I offered him everything. We have sold him several times. One day late this week I learned he had invested his $5,000 with somebody else; I clung to him as long as I could, but he wanted a certain kind of bond and he had his ideas along certain lines, and we were not able to suit him at the time, and he came across an offering that he would have taken from anybody.

You will run across the same sort of obstacles in your path in handling the private individuals as you will in handling banks and institutions, and there from my own experience too I can tell you that if the private investor

has cash in bank to invest, stick to him no matter what he tells you or no matter what another bond man, who knows you are calling on him, may tell you. A buyer will say "I am sorry, but I have a nephew or son or brother or uncle or some relation in the business" or "I have a firm I have been doing business with for years and years." That obstacle should not be too big for you to surmount. If he has money to invest, stick close to him. The best example I have had of a case of that kind was that of a large private investor whose son, just out of college, was in the bond business. Another firm had taken this boy in knowing the father was a bond buyer and they knew he had bought bonds from us. They thought "Here is a chance to get that man's business from the other firms he does business with". I knew the son was in the business, but I kept after the father just the same. He said "I buy bonds from so and so, because my son is in the business, but what have you"? I sold him ten corporation bonds that day. Some time after that I called him up and his son, who was not at work that morning, answered the telephone. He said, "Who is this?" I heard his father in the room; I could hear him through the telephone asking who it was that wanted him. I

said "This is Mr. ———". He said "Oh, yes, I am sorry, but father is out of the market entirely", and hung up. That afternoon this investor came in to apologize to me for his son's rudeness in hanging up the telephone. He said he was not in the market, but later on, in about thirty or sixty days, he would be and would give me a chance. I think he bought twenty or twenty-five thousand bonds from us. Now his son is not in the business any more. What a mistake it would have been if I had not kept after him!

I claim that the only time that it is really impossible to get a man's money is when he hasn't any money to get, or anything you can trade out. Of course, there are certain obstacles you can't surmount, but it is best to go along on the assumption that you can surmount them all. Push right ahead. If it is only for five or ten bonds a year, that is something. Ask them if they know anybody in the market; get them to give you some names; ask them if they have a brother or relative that buys bonds. I have done that many a time and found out that another member of a family did some buying. I located a brother of an investor not long ago; I never knew he did any bond buying at all. He buys possibly $100,000

in different classes of securities every year; I thought his brother was the one who did all the business.

There are big buyers and little buyers. I think the little ones are of course well worth following. They will be your bread and butter not only in your early years but as long as you are in the bond business. Therefore keep right after the man who has one or two thousand dollars at a time, even though he may have money to invest only every eighteen months or two years; keep after him, but in doing so, do not forget to nurse the big men, the ones that look impossible. I can't lay too much stress on that. These are hard to secure, and it may take three years, four years, or five years, but when you have one of them he is worth all the effort you have expended to get him. Undoubtedly the rich man, who buys fifty or a hundred at a time, is hard to get; you will often leave his office and say "I can't do anything with that man; I am simply wasting time". I have often been tempted to cancel a name, but the fact that he was buying bonds all the time made it impossible for me to abandon him; I couldn't forget that another fellow was selling him big blocks of bonds. Some of these men I am selling now; some I

haven't made a bit of impression on. I have often asked myself, and I have had younger bond men ask me how I finally landed a certain big buyer. I have asked that question over and over again from bond men who wanted to talk. I very seldom volunteer any information myself, but I can't see that there is any harm in listening to the other fellow if he wants you to.

One man in particular told me four years ago that he had certain friends that he did business with and that there wasn't a chance of my getting any business from him. He was a conservative Philadelphian, and didn't know much about bonds; I could see that from the first talk with him. I knew there was no use in my offering him attractive opportunities because he would let them slip by and one of his friends would come in right after me and offer a security that was much poorer or the yield not as attractive, and yet that fellow would get his business. I knew it was of no use for me to always be hammering bonds at this man. I therefore started on tactics that I had carefully thought out. Around the beginning of the year I would drop in and wish him a Happy New Year; I would talk anything but bonds. Along in the spring I dropped in and referred to his

summer plans; he said he was going abroad. I wanted to know if there wasn't something I could do for him while he was abroad, anything he wanted attended to or any work he would like to have done. He got to be more or less agreeable, rather smiled at my presumption and said "I am sorry, but there is nothing at all". I told him I hoped he would have a very good time and that I would see him when he came back. When he came back we had just gotten up some sort of a brochure. I asked him if he would mind reading it and give me his opinion on it; I thought probably there were some points on it that weren't just as strong as they might be. Well, less than a year ago that man finally gave me an order for ten bonds. I have sold him now—I have been about five years working on him—I have sold him over a hundred thousand dollars of bonds, and the chances are now that he tells other young salesmen that he has certain men to do business with, and I am now one of those men. A plan like this often works out with the big buyers.

I remember an individual who was very disagreeable; he used to jolly a great deal and want to fool and put me off. He was going away, and I didn't want to be put off. He said,

"I am going out West in a private car; I have just invested all my money and am going away; it is a wonder some of you fellows wouldn't decorate my car with flowers and send some candy to the ladies that are going". I said "I am your man". He said "Send them along". I said "When does your train go"? He said "No, you don't". He saw that I meant it and said "I will call you up". I said, "Don't forget". The next day I called up to find if he was there, and I found he had gone. I saw one of the men in his office a couple of weeks after and asked him when Mr. So-and-So was going to return. The clerk, who had made a calendar note of it, said he would be back such and such a day the following week. I said "If I send down a dozen American Beauty roses will you promise not to tell who sent them, and put them on his desk"? He said "Surely". The day he arrived home the 'phone rang and I said, "Hello". He said "Is that you"? I said, "Yes". He said "This is me". He was getting very sociable. I said "Oh, yes, I am glad you are back". He said "What did you mean by sending those flowers down here"? I said "I don't know anything about any flowers". He said "If you don't take the credit, I shall think my stenographer put them there". He said,

"Come down and see me". I went down to see him and he gave me an order for $10,000, the first business I had done with him. Now, I don't advise bond men decorating their customers' desks with roses or lilies of the valley, but there are lots of opportunities of this character that come up which if you grasp will redound to your advantage every time. I never did that before and have never done just the same thing since. I had that one opportunity to get next to that fellow and I took advantage of it, and now he is a good friend of mine; he knows what our issues will do.

I always tell these hard customers "If you will only give us a chance, we will show you what a firm like ours can do for you". Tell them to give you one order, five or ten bonds only; if he is a big man tell him to take twenty-five. Never let a chance to get closer to these investors get by you. There are opportunities offered every day. I have no doubt that I miss hundreds of opportunities in a year; if I was just a little wider awake to conditions to take advantage of them I could probably get closer to more of these big men. The money is there and somebody has to get it. They are going to buy bonds with it. You have a hundred different issues on your list of all kinds of conserva-

tive securities. You can suit them one way or another. It is the man behind the issue, the man who is selling the issue that is making the sale. There is certainly no business where personality counts so much as it does in the bond business.

So keep hard after the big buyers. They are the ones you are the most apt to give up. The road looks blue along the line of the big investor, but it is worth all the work you do. I could go over my list of customers and if I were to take you around and introduce you to each one of them you would find that the ones that looked the hardest to you were my best customers.

There is a trust company that I call on that has a very close fisted president. This institution ranks high among the trust companies of Philadelphia in every way, the personnel of its board, the list of its investments and the increase in the number of depositors every year, and yet the president practically throws you out of the bank if you go up to see him. I know any number of bond men that won't go near the bank. They say "He can buy from somebody else; I am tempted to hit him". Whenever I go into his office I try to be just as courteous as I can. I never dared sit down in his

office; I think he would have lifted me up and put me out. He really is the most disagreeable man I ever had anything to do with. His right bower, the treasurer, is almost as disagreeable as the president. He had started in as office boy and had risen, and he is following in the footsteps of the old man. I was up against it hard. I used to see certain bond men go in and shake hands, and it used to make me sore. Some of them I felt didn't know any more about the business than I did. Finally I said to the president, "Now, look here; I don't mind as far as I personally am concerned being heeded as little as you heed me, but I do not think it is a compliment to one of the best banking houses in Philadelphia to not give them more consideration than you do. They have opportunities that lots of other houses don't have; they have issues of a character that lots of other houses don't have". I said "It is all right as far as I personally am concerned; I am not talking about myself, but you should at least give some consideration to a house as good as ours is". I was getting pretty hot under the collar. I had thought this little speech all out coming down in the car and I could hardly wait until I got to the bank to get it off.

He looked at me and said "Well, is that the way you feel about it"? I said "That is the truth of the whole matter; I have been feeling and thinking that way about it for some time". I said "Now, we have in stock a block of Southern Pacific Refunding 4's that should interest you. We have fifty bonds on hand at such and such a price. We can sell you at the market price, saving you the commission you would have to pay on the board. Now, please give this offering serious consideration". I came back to the office and found he had called up, had asked about these bonds and bought forty-five (five had been sold in the meantime) and the next time I called to see him he was mad because the five had been sold and he could not get the whole fifty. That man is a crab and he always will be a crab, but so long as I am getting business from him he can be as crabbed as he likes. That is what you are up against. These men who have made their own way, who have started out with nothing and have risen to be bond buyers by their own merit know what it is to earn a living; they know what the fight for money is, and they are the hardest ones to get to part with it, but the best in the world when you get them started. A lot of bond men don't realize that. They

don't seem to think that if they don't get this business somebody else is going to get it. Don't give up an investor who has a lot of money in bank to invest in bonds because he says "No, I don't want them; I am not interested" because some salesman is going to come along and get the money. It isn't a question of the quality of bonds, because you must remember you have every kind of conservative security that you could possibly have, unless a man wants to buy some mining stock or wild cat investment, and of course that is a different proposition.

I find a great many bond men are very much afraid to say the three little words "I don't know". I think this is particularly true of the green man. He is a little ashamed and thinks he ought to know. After several years you will find out how many things there are you don't know. If an investor begins to question you about some bond you are not up on, say "I can't answer that; I will have to look that up; I will let you know". And be sure you do let him know. Write him a letter about it. You have every source of information right here, look it up and write him. Remember that—don't be afraid to say "I don't know".

When times are dull you can do just as good

work by getting out among the investors and the people that you know buy bonds and getting better acquainted with them. Go in and talk to them about anything that they are interested in. Learn their hobby. For instance, one old fellow will be daffy about his grandchildren; talk to him about his grandchildren. If another is a baseball crank talk to him about baseball. Talk to them about anything at all while you know they are not investing; the other fellow isn't going to get the business and you are going to get closer to them against that time when they are again in the market. I met a well known broker on the street the other day; I said, "How are things"? He said "Don't you know"? I said "Are you selling any bonds"? He said "I called on three men yesterday; two laughed and the other got mad". I think if I went to see a number of my customers in this market and started to talk to them about bonds they would laugh at me. At the same time I feel I can do a great deal of good work by dropping in on them and not mentioning a word about bonds, simply talking about something else, and getting into an interesting conversation with them. It is the man you get to know intimately, not too intimately, but intimately in a business way, that

you are going to get your business from. When he is buying he is going to buy of you; you are the fellow he is going to call up; he will think of you when you are not thinking of him; and don't make him feel every time you go in his office "I have got to get rid of that fellow the easiest way I can". It is much better if he will give you a slap on the back and say sit down, and talk about some other subject. Get around when business is bad.

I said "Don't get too intimate". I think this is more general among a certain class of salesmen than among bond salesmen, although a good many bond salesmen have a tendency to want to ingratiate themselves too much with the investor; they want to get too friendly with him, get to where they can call him Tom, Dick or Harry; they want to be personal friends. That is bad, generally speaking. I had a man today say to me "I can't count on my friends for anything". He said "I have to go outside to get business; I can't count on my friends". You know that as well as I do. Your friends aren't the ones you are going to do business with. This rule works both ways. It is just as difficult to do business with customers if you make intimate friends of them; you will be on the wrong basis with them, and they will be

sooner or later buying bonds from the fellow that doesn't call them Tom, Dick or Harry. I think we could almost make it a rule that a bond man should not in any case get too close to the man he is doing business with, that is too intimate.

Sometimes a man will tell you that he buys mortgages or you will be told that he is a mortgage buyer, and that there is no good of calling on him to sell bonds. Sometimes he buys mortgages because he does not know what bonds are. It is up to the bond salesman to show the investor that a bond is secured by a mortgage on property in the same manner that a real estate mortgage is. Show him that it is a great deal better for him to have a piece of a valuable mortgage, which a bond is, on a property that is large and whose earnings come from many different sources, than to have a mortgage on a house. Take for instance in a steam railroad issue or in an electric railway and power issue, there is a great deal more than franchise and the rails. There is valuable private right of way, valuable real estate and so on. It would have to be a great disaster that would affect the value of a property secured as are the high grade steam railroad issues, whereas it sometimes takes very little in the

case of a mortgage on a piece of real estate to affect its value. I heard of a case this week. An institution through one of its directors had been carrying along a residence property for some years in Omaha; it had been depreciating in value every year, until now it had gotten to be in one of the poorest localities of the city. The other day he told me he didn't know what had become of it until a few days after the recent tornado one of their representatives had written him that he was sorry but their house had been carried away by the high winds. A great many pros and cons can be brought into an argument of this kind. There are pictures you can paint in a general way showing these customers that a bond is nothing more nor less than a mortgage on a great many properties. Another argument for the man who buys mortgages is to turn to the tables showing the list of investments of the savings banks, the national banks and the institutions of the city or country town that you are working. This will show a great percentage of bonds owned over real estate mortgages. There is no excuse for not being able to get a buyer away from mortgages in a great many cases.

Another point; don't tell the investor too much. The average investor doesn't know and

never will know as much about investments as the average bond man; they don't know the inside workings and they are not familiar with the technical questions and points that are brought up from time to time, and if you try to tell them too much you will get them all worked up about things they have no need to think of. Cram in as much knowledge as you can, but keep that for yourself. Paint pictures. More sales have been made by a salesman painting a good picture around the issue that he wanted to sell than in any other way. The fewer details you tell the investor the more chance you have of making a sale.

There never was an ideal bond, you know; you cannot expect a perfect bond. There is always something, some argument, a crank will bring forward. I think if I were to offer some of my customers U. S. Government bonds on a 5% basis they would find some fault; they would probably think we were going to war with Japan or trump up some excuse to get rid of me. Always give them your strong points, and make the picture as pretty as you can. Of course there are questions which your customers will ask you that you should know and should be in a position to answer.

Loyalty to the house above all. The great-

est compliment that an investor ever pays me is when he turns around in his chair and says "You certainly stick up for your firm, don't you"? I believe in our firm; I believe in the manner in which things are run around here. I have experienced many things which have proved to me more and more just what kind of a house it is that I am working for. Our firm have been fair and square with their customers, with their men, and with the institutions that buy their bonds, and I am proud to work for them and to have people know it.

CHAPTER XIII

ADVERTISING AND ADVERTISING DEVICES

Unquestionably the best public vehicle for bond advertising is the daily papers. Special editions, trade papers, programmes and professional and religious periodicals are almost valueless. An advertisement to pull must first catch the eye, then lead the reader on through its entire text and finally create in him a desire for something expressed by it. For this reason standing cards are less effective than copy that is changed regularly. In fact they have little value at all for general publicity for an habitual reader becomes so used to seeing them that they do not even challenge his attention. Copy that is attractively set up and at the same time may be read with the least visual effort is better than more space devoted to a mass of black ink. A hodgepodge of type and the featuring of a multiplicity of points are not only bad taste, but they spoil the appearance of the advertisement and cheapen it considerably. Type that is fancy but hard to read loses part of its value. The wording should be brief and to the point; otherwise the attention will wan-

der and be lost. There is ample room for taste and individuality in the composition of a good advertisement.

Blind ads, that is ones that conceal the primary facts of the article offered, pull better than open ones, and ads that offer to give something away pull best of all for the instinct to get something for nothing is ever present. Spasmodic displays do not have the same effect as the persistent and frequently recurring use of smaller space. Some years ago the writer was criticised as being unconventional by some members of the old school on account of using live copy and changing it periodically instead of confining himself to the established business card, but apparently by now nearly all of the old school must have passed away or else become rejuvenated for the latter style of advertisement is seldom used now except as a rate holder.

Does advertising pay? Yes and no. Long lists of securities owned and special display offerings of new issues produce few inquiries. In fact, it is doubtful if on the average they bring in enough business to pay for their cost, but if a house maintains an active selling force the general publicity and the atmosphere created are worth a great deal. Otherwise ad-

vertising is only of value for the inquiries it produces, for it does not directly sell bonds, and these inquiries yield no return unless followed up. Inquiries cost anywhere from two to twenty dollars apiece. On the basis of traceable results they seldom pay for themselves in the first instance, but must be credited with subsequent business in order to compensate for their original cost.

For this reason periodicals of a national character are hardly a profitable medium for financial advertising unless the advertiser has an organization that is more than local in scope, and is sufficiently broad in field of operation to permit personal attention by salesmen to the inquiries as they are received. Magazine inquiries cost anywhere from twenty to fifty dollars each, and are a pretty expensive luxury unless their full benefit is extracted from them.

An inquiry is a good deal like a pig in a poke in that its real value cannot be determined from the way it sounds. The one that reads best may be actuated only by curiosity, while another that appears trivial may contain latent possibilities out of the ordinary. For this reason more than usual care is required to handle such leads properly. An incapable salesman

may not get anything out of them while another man may find them productive of much business. The prospect who writes in for information is generally approachable but nevertheless on the defensive on account of the house being a stranger to him, so that confidence has first to be established. Frequently no transaction results the first time, but if the lead appears to be a good one and is carefully cultivated, the salesman may be rewarded with an order the next time the prospect is in funds. If one salesman falls down on an inquiry and gets nothing out of it, his work can be checked by turning it over to a second man for handling, particularly if the first effort fails to locate the prospect as sometimes happens. The law of averages holds good here as in every other phase of the business, and out of every so many leads, regardless of their nature, it is pretty sure that a certain percentage will produce enough results to more than compensate for the time and attention required to handle all of them properly.

General publicity is of great value in that it paves the way for personal salesmanship. When a salesman calls on a prospect for the first time the ice is broken more readily if the latter says "Oh yes, I know your house", even

though as a matter of fact he probably does not know a thing about it except that its name is familiar to him through an impression that is stamped upon his brain. A curious illustration of this occurred one time and will bear repeating. A salesman called upon a new prospect in response to an inquiry and found him a cripple bedridden for years. A sale was consummated, and then the salesman said "If you will pardon me, I am curious to know what induced you to write to us". The customer replied "Well it was this way. I had a little money to invest and didn't know what to do with it so by chance held up the financial page of the morning paper, and asked the nurse here what house she would write to of those that advertised. She hesitated a moment and then said 'Why to that one, pointing to your advertisement.' This confirmed my own impression and so I wrote to you". Thus was the call of dignified copy and neat composition answered.

Better than any kind of periodical or newspaper advertising is direct appeal by mail. This may be by personal communications, form letters, printed flyers or circulars. Of these, individual typewritten letters yield the largest percentage of results but are not susceptible of wholesale application simply be-

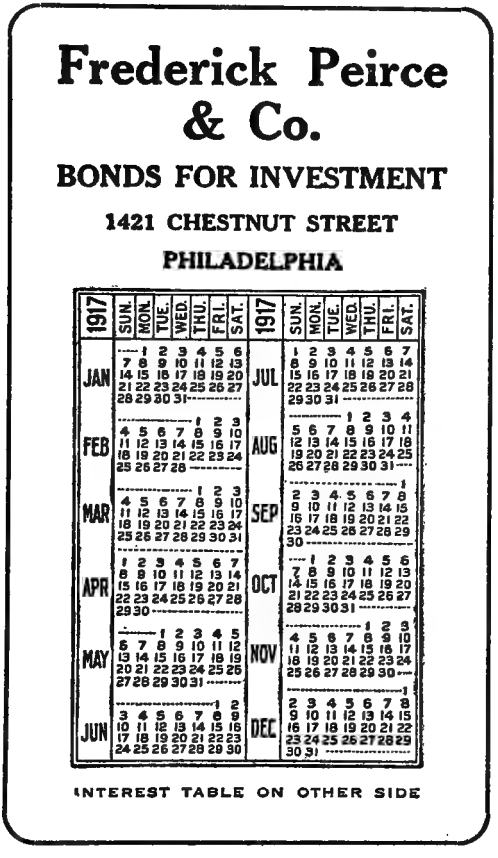
cause enough bonds cannot be sold by mail to pay for the cost of maintaining a force of men competent to conduct a correspondence department that is capable of giving intelligent and individual written advice to thousands of different people. Form letters are the best substitute but these quickly become stereotyped in expression unless great care is exercised to give them originality and variety. From the standpoint of quantity rather than quality printed circulars and flyers take the lead. These all are superior to display advertising, for both results and general publicity but even here the returns are usually disappointing for the replies seldom equal one half of one per cent. of the number of pieces mailed. Direct appeal is of value simply to lay the foundation for the salesmen, but then there is always the chance of getting an order that will more than pay for the cost of the entire advertising campaign as happened recently when the writer made a sale by circular to a customer whom he had never seen or dealt with before, and the profit on this one transaction was calculated in four figures. Of course, things of this kind do not happen very often but they are the bait that leads one on to advertising extravagances.

To secure the greatest returns in proportion

to the expenditure, direct appeal should reach the greatest number of people at the smaller cost per piece. The so-called novelties have little advertising value in the bond business. It is doubtful if an inkstand or a cigar lighter, or a blotter ever produced an order, whether it cost fifty cents or four dollars. A souvenir should be relevant to the business. Furthermore it should be so inexpensive that it can be distributed in large quantities. Some houses make a practice of giving to their best customers articles that are comparatively expensive as advertising things go. As a business proposition, if a man is already a good customer, will he produce anything more in the way of orders if given something he probably doesn't need, at a cost of a dollar or two to the donor? Isn't it more logical to go after those who are not yet customers, but who aggregate many times the number who are?

The writer has always gone on the theory that instead of giving away say five hundred articles at a cost of one dollar each, to people who are already customers it is better to distribute ten thousand at a cost of five cents each to the people whose patronage is desired as well as to those already on the books. This theory was put into practice some years ago

and has since been consistently followed in the distribution of a celluloid Calendar and Bond



Interest Table which he originated and of which a copy is here given. Before this was devised, every interest table with which he was

familiar, consisted of at least six pages, and was convenient neither for reference nor to

BOND INTEREST TABLE

Exclude day of delivery and to the interest for the full month or months, add the interest for the remaining days. Calculate 30 days to the month and 360 days to the year.

INTEREST ON $1000 FROM 1 DAY TO 5 MONTHS

Days	3½%	4%	4½%	5%	6%	7%

28	2.7222	3.1111	3.500	3.8889	4.6667	5.4444
29	2.8194	3.2222	3.625	4.0278	4.8333	5.6389
30	2.9167	3.3333	3.750	4.1667	5.0000	5.8333
1 Mo	2.9167	3.3333	3.750	4.1667	5.0000	5.8333
2 Mos	5.8333	6.6667	7.500	8.3333	10.0000	11.6667
3 "	8.7500	10.0000	11.250	12.5000	15.0000	17.5000
4 "	11.6667	13.3333	15.000	16.6667	20.0000	23.3333
5 "	14.5833	16.6667	18.750	20.8333	25.0000	29.1667

carry. This souvenir is pertinent to the business, it costs about one and one-half cents per copy and accompanied by a return post card,

is productive of much valuable information. The table, the return card, the container envelope, and the stamped envelope enclosing them cost all told about three and one half cents per set. Notwithstanding the very nominal cost, this annual souvenir is the most popular financial advertising dodge ever originated by the writer, and it takes just as well today as it did ten years ago. In fact it is so popular that it is copied by competing houses, notwithstanding every effort upon the part of its originator to prevent it.

Another case will serve to further illustrate the point. Some time ago the writer wanted to test out a large list of new names to find which were bondbuyers. He therefore wrote a little booklet of financial epigrams under the caption "Fifty Financial Facts". (See Chapter XIV.) This consisted of twelve pages and cover. The printer was instructed that it should not cost over one and one-half cents per copy and together with a long return card and a Government No. 8 stamped one-cent envelope should weigh less than one ounce. The specifications were met, the entire cost was just three cents per copy including the card, envelope and postage, and some fifty thousand booklets were mailed out with excellent results in the way

both of the desired checking and of general publicity.

More or less pertinent to the topics discussed in this chapter is the subject of a "follow up system". The writer has been asked repeatedly what system he used to follow up the work of the salesmen. His reply always was that he had never been able to devise a satisfactory system and had never found any one who had done so. While every well organized bond firm has one or more methods of trying to keep in touch with its customers and prospects, there is no substitute for personal contact. The salesman must follow up the customer, and the office must follow up the salesman. No one house can get all the business, or there would be only one house in business and such a condition never has and never will exist.

CHAPTER XIV

FIFTY FINANCIAL FACTS

In 1915 the writer prepared, under the above caption, a booklet "For the Inquiring Investor". The purpose and use of this were outlined in the previous chapter (XIII), and here it may not be amiss to give the text, which except for the omission of a graphic chart of investments, is as follows:

FOREWORD

COMMENT has been made that the usual financial presentation is understandable only to the relatively small number of people who make a study of scientific investment; and that banking houses should appeal to the general public or the great body of investors, in direct and simple language, free from technical expressions. It has, therefore, occurred to the writer that the exposition in clear, concise epigram, of some of the salient features of successful investing, would prove of service to those who are uncertain which way to turn, and are fearful of making a misstep.

This pamphlet is consequently two-fold in purpose:—(1) to present in crystallized form some homely philosophy, familiar to all, but too

frequently forgotten when parting with one's money; and (2) to explain in untechnical language some of the more important technicalities of bond buying.

The thoughts herein expressed are the result of some years of very practical experience in the analysis and sale of securities and particularly in the study of thousands of cases of investing—successful and unsuccessful—that have come to the writer's attention.

May these epigrams bring to a focus some of the more important truths expounded in detail in that vast store of financial literature which is within the reach of everyone but seldom read by the man who works hard to earn his money and yet does not take the time to study how to conserve it.

FIFTY FINANCIAL FACTS

1

Know your banker

For he who puts his faith in a dependable banker need fear no rainy day.

2

As the oak grows from the acorn, so the dollar saved is the seed of the thousand dollar bond

For the real bond buyers of the Nation are the thrifty rather than the rich.

3

And no sum is too small to require good advice

For the small buyer of to-day is the large buyer of to-morrow.

4

Put not your trust in him who promises both safety and large profit

For no dollar can do two kinds of work at once.

5

A safe first mortgage by any other name would be as good and a bad security is not bettered by a good title

For bonds, like men, are valued by character, not by name.

6

The shrewd man does not put all his profits back into his own business

For in times of stress an anchor to windward may save the ship.

7

Beware of any security whose safety depends upon good management alone

For it is human to err and the personal equation has no property value.

8

The home investment is frequently a false idol

For while a prophet is not without honor save in his own country, wealth goes by contraries, and familiarity invites overvaluation.

9

Likewise he is foolish who invests too large a part of his savings in one community

For the fall of even a strong basket may break all the eggs in it, and good baskets are more abundant than good eggs.

10

The individual adviser is usually an egoist

For he advances his own theory of what is.

11

While the investment house is a composite altruist

For it employs the experience and judgment of the crystallized organization and the ego is subordinated to fact.

12

No one man possesses requisite knowledge and experience to pass upon all the features of a large financial transaction

For the proper protection of the investor requires the co-operation of banker, lawyer, engineer, accountant and business expert.

13

Consequently he who would invest with certainty should seek those who are competent to advise him

For the safety of a structure is not determined from the man who photographs it when completed, but from those who pass upon the materials and workmanship that go into it.

14

He, who, on his own responsibility, takes a real estate mortgage in preference to a bond flatters his own judgment

For he assumes a business risk in order to match his individual opinion against the combined knowledge and experience of a staff of experts.

15

A dollar safely invested is worth more than ten thousand that have been lost

For in financial matters experience is a teacher whose lessons are not worth their cost.

16

The intrinsic worth of a security is of more importance than the color of its ink

For some bonds are donkeys in lions' skins, while others that do not put on such a bold front have the backbone that endures.

17

Each generation has its Mississippi Bubble

For man loves the spectacular, and the lure of gold dims the oft-learned lessons of experience.

18

But those who are conservative are not attracted by false prophets

For the reliable banking house is like unto the ship that has weathered many a storm and carried its passengers to safety.

19

Buy not a guarantee but look to the intrinsic worth of a security

For the strong man needs no crutches, and the lame man, even with the best of crutches, is a poor traveling companion.

20

Be not fooled by the house that agrees to "buy back at the price paid"

For even as King Canute was powerless to stem the tide, the "buy back" houses are sooner or later swamped by the flood of their own securities, and the agreements to buy back are washed away in the deluge.

21

A safe house does not use unsafe methods, and an organization that is unsafe in one thing is usually unsafe in others

For when one weak link is visible in a chain, others may be concealed and the banking house to be safe as a whole must be safe in all its parts.

22

Rely on the house that makes an honest and real market for its securities

For when bonds are properly placed, the law of supply and demand, which governs all prices, tends under normal conditions to maintain its equilibrium.

23

Listing a bond does not in itself create a ready market

For there must be a buyer for every seller and a seller for every buyer.

24

Far more important than listing, is it to have a security well distributed in the beginning

For listing merely affords an additional opportunity for a previously created buyer and a previously created seller to trade.

25

Likewise the Stock Exchange is not the real market for bonds

For against every one sold on the Exchange a thousand are sold outside.

26

Also the man who buys a listed bond usually pays for the pleasure of seeing it quoted

For the greater the demand for a given issue, the higher becomes its market price.

27

And if a bond investment must be quickly negotiable under all conditions, that privilege is

purchased at the expense of either safety or yield

For any security can possess the maximum of but two of the three factors of safety, yield and marketability, and the remaining factor is lessened thereby.

28

To analyze correctly the earnings statement of a holding company, add together the net earnings of all the subsidiaries, and against the resulting amount, offset the total fixed charges of both subsidiaries and parent

For many a weak corporation makes a strong earnings statement to sell its junior securities by featuring merely the surplus income available therefor.

29

And a disingenuous statement needs more than ordinary scrutiny

For if a company does not earn a comfortable margin above all its fixed charges, its bonds are not without risk.

30

Some industrial or manufacturing company bonds are safe

For there is some good in everything.

31

But such securities as a class are speculative in character, and suitable only for the man who can take a business risk

For the earnings of industrials fluctuate widely with business conditions, and the margin of safety is uncertain.

32

While well selected public utility bonds possess an unusual degree of stability

For they are the obligations of companies supplying public necessities such as gas, water, electricity and transportation, for which the demand increases with the growth of population and assures a constant and increasing earning power.

33

The man who says "I buy only municipals" or "I buy only railroad bonds" reasons from a false premise

For there is good and there is bad in everything and no one class of securities has a monopoly of virtue.

34

But he who buys the best of the municipals, the best of the rails and the best of the public utilities is farsighted

For he selects the safest bonds of each investment class and shuns the rest.

35

From a pecuniary standpoint, he is a wise investor who is not scared into buying municipal bonds on account of the Income Tax

For the Sur-tax is almost negligible in its effect on income yield, and safe corporation bonds can be bought to return so much more than safe tax exempt municipals that the difference in annual income will pay the amount of the tax several times over.

36

In dealing with an investment banker, the buyer who candidly states his position, and frankly admits his inexperience fares well

For his adviser feels morally bound to give the best of advice and service.

37

And the buyer who is well informed usually fares well

For he can take care of himself.

38

But the man who does not know anything yet pretends that he does, usually rides for a fall

For he is unwilling to take anyone's advice, but insists upon buying whatever his inexperienced judgment may light upon.

39

The difference between "cost price" and "selling price" is not all profit to the banker

For every bond issue that is brought out has to pay the expenses of ten that have been investigated and rejected.

40

Consequently it pays to deal only with the best houses

For bonds, like pearls, require experts to appraise them.

41

And the bargain hunter in securities is like the man who carries his own fire insurance

For he takes a risk rather than pay a small premium for protection.

42

When a corporation is constructed like a pyramid, with one dead weight upon another, it is advisable to keep at a safe distance

For the laws of gravity apply to finance, and if a structure is top-heavy, it will fall.

43

But if you must invest in a pyramid, see that your stones are at the bottom of the pile

For they will be least disturbed by the collapse of the superstructure.

44

When a producer is his own selling agent, let the buyer beware

For under such circumstances one can not count upon disinterested advice.

45

But the investment bankers who do not promote enterprises are the safe leaders

For they can be impartial in their examinations, purchases and recommendations, and there is no necessity for them to raise capital for a company when their judgment deems otherwise.

46

The man who subordinates the thought of prompt and safe investment to an ambition to buy at the bottom and sell at the top, usually comes out the loser by buying at the top and selling at the bottom

For he makes mountains out of molehills, and molehills out of mountains, with the result that his vision becomes blurred and he loses all sense of proportion.

47

But the man who takes advantage of the opportunities of the moment and invests safely and wisely without worrying about the future of the market usually fares well

For he enjoys peace of mind, while the law of average secures to him a fair return on his money.

48

For the ordinary person or the one dependent upon his income, stocks are an uncertain form of investment

For their dividends depend upon surplus earnings, and during times of depressed business may be reduced or passed entirely, while bond interest is a fixed charge and a first lien on the operating income of a company.

49

Buying from a "friend" or "relative in the business" is frequently an expensive policy

For customary business caution and ordinary conservatism are unwittingly sacrificed to blind faith and favoritism.

50

Finally, if you are interested in sound investments for investment's sake, if you want judicious and candid advice, if you want the benefit of high ideals and long experience, if you want the protection of thorough examination and competent experts, if everything considered, you want the Most Satisfactory Bonds

Deal with the house that is in business for more than a day, that is actuated by a sense of high moral responsibility towards its customers, and that tries to give a full dollar of value for every dollar received.

CHAPTER XV

TENDENCIES OF THE BUSINESS

The bond business has been undergoing a radical change for some years. With the enormous increase in the number of investors of moderate means, the old idea that the investment banker had to stand on his dignity and wait for customers to seek his advice and wares has given place to an aggressive contest for business, and the distributing houses that have not kept pace with the times have ceased to be an important factor in the marketing of securities. Many of the old line customers have passed away and the ones who have taken their places are on the average of much smaller financial calibre. The volume of business has grown by leaps and bounds and the number of individual buyers has multiplied many fold but the average sales are constantly getting smaller and smaller. A clientele of this character is much more dependable but it necessitates larger and better trained organizations, greater efficiency of management and a more uniform and higher type of investment service.

Competition for customers, and competition

for bonds to sell, together with a broader appreciation of the various classes of securities, have reduced the gross profits to a point where the largest retail houses, handling a volume of business represented by nine figures, are fortunate if they can average much over one per cent. of the par value. Statistics of this sort are not available for comparison but it may be assumed that in normal times anywhere from fifty to seventy-five per cent. of the profit is consumed in operating expenses. In years of poor business, which come periodically and almost with regularity, the surplus above expenses is generally reduced considerably and sometimes wiped out entirely. At such times too, heavy shrinkages are entailed in the prices of securities on hand, and these may have to be charged off against surplus profits carried over from previous years for the bond house does not buy its issues for permanent investment but for resale in accordance with prevailing market conditions and its losses are actual instead of on paper, as is the case with a fiduciary institution which can continue to hold its investments until the market again recovers on them. For these reasons the average profits of the true type of distributing bond house are comparatively small, and entirely out of pro-

portion to the capital and organization employed and the risk entailed. In fact, it has been repeatedly stated, that there is no money in the bond business. It is true that industrial businesses periodically pass through very critical times, but when the opposite holds good they more than make up for it by earning abnormal profits. Very few fortunes have ever been made in the direct retailing of securities.

It is an unfortunate result of this condition that the temptation is ever present to undertake the financing of industrial combinations and the promotion of new enterprises. The more conservative firms endeavor to steer clear of operations of this sort else they sooner or later suffer sad experiences, while the so-called promotion houses, which travel an entirely different road, are more oblivious to the permanent safety of the issues they market and sometimes leave a trail of grief behind them.

Large selling organizations are becoming the rule of the day, and branch offices have largely taken the place of correspondents. Such organizations have one very serious drawback, namely their inability to adapt themselves readily to the constant changes in the supply of and the demand for securities. When business is dull, that is when the market

is apathetic, and it is easier to buy than to sell, and profits are eaten up by expenses, the overhead cannot be reduced by cutting down the size of the organization as in an industrial plant, for it is so difficult and expensive to build up an effective sales force that it would be suicidal to impair it; and when the market is hungry and the salesmen are working at high pitch the buying department is hard pressed to get suitable goods to sell so that in the endeavor to find enough fuel to keep the machine running there is the risk of standards being let down and inferior securities creeping in.

As an illustration of the tendency of the times, one ambitious concern is reaching out in all directions with the apparent purpose of trying to annex all the investors in sight. However, the bond business cannot be run on the plan of a chain of cigar stores, of corner groceries, or of five and ten cent stores, where the selling is merely ordertaking and the authority all comes from one central bureau and the direction of the agencies is a matter of routine, and in accordance with a cut and dried system. To sell securities successfully through a large organization, every branch manager must be a sales manager, he must create a local atmosphere and be able to secure the confi-

dence of the people with whom he comes in contact, giving to his work the same devotion as if it were his own business, and he must have sufficient latitude and authority to develop his field according to his own originality and ability. Men of this type are rare, and rarer still is the man who has the personality and is competent to handle a group of such sales managers without friction, to keep them pulling together in the fullest unity and to maintain the numerous branches in complete coordination and at their maximum efficiency. No other business is more sensitive to competent or incompetent management, and so long as the demand for men with the highest executive qualifications is greater than the supply, just as long will monopoly fail and the right to "live and let live" endure. When an organization becomes too large, the personal equation is lost sight of, the supply of suitable securities it can obtain is too limited to ensure the proper protection for its customers, the interests of the individual buyer are subordinated, and the investment service rendered is of a superficial and mechanical nature so that the concern becomes merely an impersonal machine. For these reasons there need never be any fear of a devouring octopus in the bond business.

In the general financial scheme so long as there are men of ability who prefer to maintain their individuality and there are people who want sound advice, there will be many firms catering to the investment needs of the public and supplying the quality of service which thus can best be given. As stated before, the bond business is a profession and is based just as much upon the personal relation of adviser and client as is law or medicine. The buyer of securities, as a rule, has to accept the word of the seller, and confidence therefore is the keynote. The service is individual and the recommendations of the adviser must be adapted to the requirements of the client, else they are without value. When a firm is independent and can make its selection from all the bonds available at a given time regardless of who produces them, instead of being under constant necessity to originate enough issues of its own to keep a large organization employed, it is in a position to combine with real personal service the widest range and the best choice of securities the market affords.

Thus, only when the personal relation of adviser and client is developed to the maximum is the highest function of the bond house fulfilled.

CHAPTER XVI

CONCLUSION

In this day of keen competition, one might well wonder at the disclosure so freely made of business secrets, and of the knowledge and experience gained by long years of persistent effort. The answer is that nowhere does the personal equation enter more largely than in the bond business and as one artist cannot execute another's conception so each person must originate his own particular system and carry it to a successful conclusion. It is not expected, therefore, that the ideas and incidents, portrayed in the previous chapters, can be used in the exact form in which presented, but it is hoped that they will not only be of some immediate practical value but will stimulate the further development of new methods, adaptable to this and other lines of activity.

Throughout this discussion, one commanding fact should be clearly evident—that after all success is due to individual and not material factors, and is determined solely by the measure of the man; so if this book serves no other purpose than to be an encouragement to young men, and to spur some of them on to victory, the writer will feel more than compensated for all the time and thought he has devoted to it.

SALESMANSHIP

I

RULE-OF-THUMB SCIENCE

If one average man, fifty years old, could and would tell the truth about himself, we should have a priceless textbook on life.

The other day I sat beside a man in the library car of a twenty-hour New York to Chicago railway train. Faintly, like the outline of year-old furrows in a fallow field, there lay upon his face the traces of a fast-lived youth. Discretion had checked and right living in part repaid youth's borrowings from old age. He had funded and underwritten the debt of his youth. He held the shares himself and was paying to himself a yearly dividend upon a capitalized deficit of wasted brain and body.

If this man told the whole truth about himself, it would be a story worth hearing, for it would convert to the convincing coin of experience that vague debt to self and society which

our elders seek to define by general and impersonal precept.

Convince this man of the real value to others of his experience and I have little doubt that he would attempt a true narrative of it. He is fine enough for that. But I am sure he could not tell the real truth about himself. When a man talks about himself he is unfailingly disingenuous. As the race-track dopesters would say, you have to "throw out" what a man says about himself. A man's recital of his own experiences may be entertaining or amusing, but is rarely, if ever, a trustworthy guide for others' conduct — except when the narrative departs from the narrator's portrayal of himself and touches upon his observation and estimate of events which were wholly beyond the real or imagined influence of his own acts.

This is a rather formidable beginning for a talk on salesmanship. I fear I must produce an anti-climax if I am to reach my subject within five hundred words. But anti-climaxes, like premature explosions, sometimes make

deep indentations. The thought I want to indent you with is this: A man can't tell the whole truth about himself.

Realize this and you grasp the hopelessness of learning much about salesmanship from the recounted experiences of others. A sale is a contract. One of the dryest, and accordingly one of the most authoritative, legal commentators the world has ever known, in part defines a contract as a "meeting of minds." Therefore, knowing how to be a salesman would seem to consist in knowing how to make minds meet — your mind and your customer's mind. Does any one know how? The reminiscences of the veteran salesman are calculated to impress one that he has learned the secret. But reminiscence nearly always recounts successes and touches lightly or not at all upon failures. As an example of that I commend to your notice Mr. Thomas Lawson's occasional reviews of his services to the speculating public.

There are lots of good salesmen, but scarcely any who can really tell you anything

about salesmanship. Take the worst example of poverty-stricken and unsuccessful lawyer and compare him with the best example of flourishing and highly paid salesman. You will find that the poor lawyer probably knows twice as much about law as the good salesman knows about salesmanship — this despite the perplexing turkey trot which vested rights, public clamor, rule of reason, and judicial recall are doing before the distracted vision of our imperiled judiciary. Make the same comparison with doctors, architects, dentists, engineers, actors, and chorus men — yes, even chorus men, for a chorus man has to know more about being a chorus man than the average salesman knows about salesmanship.

Have I a grudge against salesmen? Indeed, no. I am a salesman myself. I've done my trick at managing them. I'm through with managing salesmen, I think, but I shall never cease to be a salesman. When I roast salesmen, I'm roasting myself. Don't forget that.

Why is salesmanship so little understood? In trying to answer that question let us try to

find something that can be compared to selling merchandise. There are points of comparison between salesmanship and love-making. Who can tell anybody anything about love-making? Many a despairing Romeo gets advice, but what good is it? Many a tattler boasts of his conquests, but how true is it? Love — like salesmanship — involves a meeting of the minds. I have never credited the heart alone with being responsible for the tender sentiment. What makes the minds of lovers meet? Suppose you once won the affections of a slender brunette. What chance would you have with a stout blonde? The same chance — precisely. As my friend Tom Connors says: "When you lose, you deserve to lose, and when you win, it's luck." It is somewhat that way with salesmanship.

I have been a salesman quite a number of years. I think and dream salesmanship and — what is more important to me — I live by salesmanship. Yet I don't know very much about it. But, little as I know, I shan't be able to tell you as much as I know, for a man

can't tell all he knows about selling goods without an honest and just analysis of himself. And who is capable of that? However, I'm going to tell you as much as I can.

If a sale involves a meeting of minds, let us consider the kind of minds the salesman's mind has to meet.

One day on a Rock Island train I overheard a conversation between a grocery drummer and a hardware salesman. The grocery man said to the hardware man: "Selling goods is all in sizing up your man. You can't handle any two men alike. I read character at a glance."

The train pulled into Iowa City, and the three of us and a few others clambered into the hotel bus. Now every traveling man, who has been on the road long enough to qualify himself for commercial travelers' accident insurance, knows the etiquette that should be observed in a country hotel bus. No matter how voluble you may have been aboard the train, you relapse into a gloomy silence the instant you enter the hotel bus. You gaze with unseeing eyes over the shoulder of the man oppo-

site you and surrender your mind to a painful consideration of the gastronomic horrors in store for you at the hotel.

At such a time no one but a grocery drummer would venture upon any form of conversation beyond a contemptuous reference to the departing train, a sarcastic comment on the bus driver and his vehicle, or a self-commiserating estimate of the hardships of a traveling man's life. Grocery drummers alone are immune to the rising gorge that chokes other traveling men as they journey from the railway station to the hotel of a country town (apologies to Iowa City and its passable taverns).

This grocery drummer was no exception to the exception, and after he had set fire to "an Havana-filled, Sumatra-wrapped," twenty-seven-dollars-a-thousand "grocer's delight" and recovered his suitcase, which had bounced off the seat on to the toes of a bilious-looking Marshall Field carpet and curtain man, he resumed his appreciation of himself. "Human nature," he observed, "is pretty much

the same the world over — even down in Washington County among the 'Aw-mish.' I got a system now that they all fall for."

Smile; please smile at this. And yet, why should you? For you have heard equally contradictory statements from the mouths of other traveling men who were trying to explain their methods, and — if you have ever been a traveling man — you have possibly made the same sort of conflicting statements yourself.

But what he said was n't so foolish after all. This chap was very close to a great truth. He was close to it without comprehending what the truth is.

Human nature is pretty much the same the world over — the United States over, at least. On the other hand, none of us are exactly alike in character or temperament. A salesman who had five hundred potential customers, and could read their characters and adapt his methods to the character of each, would have five hundred different methods — a different method for every customer. Mani-

festly no traveling man could have five hundred different methods. I have never known one who had as many as five. One method is the limit of the average salesman if you correctly define the word "method."

Possibly, if a salesman could really read character he would also be gifted with sufficient versatility to apply a different method to each different kind of character. But who can read character? I don't understand my own character. You don't understand yours. How can you read mine? How can I read yours? The shallowest character lies too deep to be fathomed by the most penetrating eyes. The supposed manifestations of character which mark a long and intimate acquaintance with a given man are not to be depended upon. How much less can we rely on our superficial estimate of a stranger.

The young man who contemplates salesmanship as a profession may safely free his mind from the thought that the ability to read character is an essential qualification. However, there are two desirable qualifications in

a salesman which are perhaps responsible for the mistaken theory that an experienced salesman becomes able to read character. The first is the ability of the salesman to adapt the method of his approach to the apparent temperament of his customer. The second is the curious faculty of divining the proper time to risk everything on the "closing talk." The first is easily enough explained and easily enough acquired. The second is infinitely more difficult. Both will be touched upon in their proper places.

Now, I have gone as far as I can without dividing a sale into its four severable parts. This division is imperative to an intelligent consideration of the subject of salesmanship. It is even more important to the actual making of a sale. The projection of your mind to a successful meeting with another human mind requires the accomplishment of four distinct steps with your auditor: First, you must gain his undivided attention. Second, you must arouse his definite interest. Third, you must create an unqualified belief in and

accord with your statements. Fourth, when you have removed all quibbles and doubts from his mind, you must replace them instantly with an impelling resolution to do the thing you ask.

These four steps, whether accomplished by the salesman's skill alone or aided by the customer's previous deliberations or some freak of circumstance, must occur in every sale. It is important that the salesman be sure the first step is accomplished before he essays the second; the second before he attempts the third; and above all else he must proceed to the final step at precisely the proper moment — the psychological moment, if you will.

We take up the consideration of the first step: attention-getting or approach. Our friend the grocery drummer said, "You can't handle any two men alike"; and implied that he handled his customers according to his estimate of their respective characters. He also said, "Human nature is pretty much the same the world over." I say that he was very close to a great truth without comprehending

what the truth is. There is comparatively little truth in the statement that "You can't handle any two men alike," but it contains enough self-evident truth to be fatally misleading if one does not establish its proper relation to the greater truth that "Human nature is pretty much the same the world over." There are certain impulses, ambitions, prejudices, vanities, and suspicions which in varying degree are common to us all. A considerable part of judge-made law is based upon the judicial concept of that creature of hypothesis called an average man. In numerous law cases and in numerous kinds of law cases, the conduct, thoughts, and motives of the individual are measured by the judge's or jury's estimate of what would be the conduct, thoughts, and motives of the average man in similar circumstances. This average man, which the courts attempt mentally to visualize, is nothing more or less than a definite embodiment of our grocery drummer's theory that "Human nature is pretty much the same the world over."

As a rule a traveling salesman who is about to take to the road with a new line of goods does not plan in advance the precise manner in which he will present his proposition. If you ask him what methods he intends to pursue, he is likely to say, "It all depends on the man I'm trying to sell. I'll probably have to handle each case differently."

What he really does is to outline in his mind the talking points which he believes will be effective. When he reaches his first prospective customer he makes use of as many of these points as he remembers or finds an opportunity to present. The salesman's imagined handling of each case "according to the man" is largely a delusion. The salesman does n't handle the "man." The "man" handles the salesman, because the latter has not worked out and rehearsed a definite plan of action. After a salesman has interviewed a number of potential buyers, he evolves a more or less uniform method of presenting his subject. This is what he calls the result of his experience. But it must be remembered

that experience does not become knowledge until it is fused with thought in the crucible of analysis and reflection. I have no hesitation in saying of the salesmen whom I know that ninety per cent of them fail properly to analyze and reflect upon the daily events of their experience. As we progress, I hope to make this thought clearer, but for the present this reference is sufficient.

While I do not think a salesman should adopt the methods of the actor, I do feel that he should know his book as well as the actor and strive for effects as zealously. I also believe that his book should be prepared with as great an effort to achieve sustained interest and moving climaxes as characterizes the construction of a play.

Now let us get back to a more circumstantial discussion of the meeting of minds which must occur in every sale. As the gaining of attention, most aptly called approach, is the first step in a sale, it is evident that a salesman who undertakes to work out a definite method of procedure should first plan his approach.

This brings us face to face again with our average man, for we must create in our minds the average man against whom our selling attack is to be directed.

At this point, the average salesman, after asserting with more or less vehemence that a salesman's approach should depend entirely on the character of the man approached, is likely to say, "And even if there was anything in this 'average man' idea, you'd have to have a good many different kinds of average men. You'd have to have an average country merchant, an average city merchant, an average jobber, and an average salaried buyer." Such a statement, reasonable as it may seem, is to my mind an indication that the salesman who utters it has failed to make a thorough analysis of his experiences.

In forming your estimate of this average man with whom you are to deal, it is n't necessary to consider whether he's going to sit in a luxurious private office or on the edge of a pickle barrel. Those are distinctions to be

considered after you have approached him as an average man.

The best way to create an average man in your mind's eye is to analyze yourself and subtract from yourself all of the hobbies, fads, vanities, aspirations, weaknesses, and prejudices which, so far as you are able to judge, are not shared with you by a majority of your acquaintances. Take what is left of you and add to it any of the hobbies, fads, vanities, aspirations, weaknesses, and prejudices which you do not possess, but which you believe are possessed by a majority of other men. The result will be about as close as you can get to a true concept of an average man. It is difficult to be sincere in one's self-analysis. Perhaps it is equally difficult to be just in one's estimate of others. Also there is an admitted difference in the ability of men to judge themselves and in both their ability and opportunity to judge others. But similar difficulties and similar differences in result are incident to any purely mental function when performed by different people.

I am going to attempt a few illustrations of this method and my own application of it. To do so, I must present a certain amount of self-analysis, and I have warned you that it is difficult for a man to discover the truth about himself—or tell it after he has discovered it. With a reiteration of that warning, let me proceed.

I imagine myself to have a sense of humor. However, my observation of mankind is that a majority do not possess a very highly developed sense of humor and are either irritated by or fail to comprehend any but the broadest or most colloquial sort. Therefore, my average man's sense of humor is of a very primitive order, and when I approach him, I am as serious as I know how to be.

Personally, I adore clever people and detest stupid ones; but my experience of mankind is that a majority, if not stupid themselves, at least are antagonistic to cleverness. Wherefore my average man takes no pleasure of cleverness in others, and I make no attempt to appear to him as clever. It is no doubt well that I do not, for true cleverness is a rare quality

As a youth I possessed a somewhat fluent tongue and a very great admiration for elegance of diction in others. But I observed that most men are inclined to be suspicious of what they call a "smooth talker." At this stage of my career, which was shortly after I commenced to try to sell merchandise, I ran across an Englishman who was a very successful life assurance solicitor. He had the appearance and manner of a villain from Drury Lane melodrama and the halting speech of an American musical comedy Englishman. But in spite of this, he sold huge quantities of life assurance, and I observed that his sketchy way of presenting his subject seemed to kindle the interest of the people he approached and, instead of escaping through the gaps in his arguments, his auditors were more likely to build up these gaps by their own questions and the exercise of their own imaginations, until they had completely ensnared themselves. As a result of my study of this man's methods I adopted taciturnity in place of my previous glibness of speech when approaching a

potential buyer. For my previous flowing and more or less flowery sentences I substituted brief staccato utterances — more or less incoherent, but capable of extreme emphasis, and, by virtue of their very incompleteness, arresting the attention and challenging the interest of the person addressed.

Personally, the positiveness of another's views does not impress me; instead it breeds in my mind distrust of his sincerity or the suspicion that his knowledge is superficial. I try to make it a rule to be influenced by no one's opinion unless I know the facts or theories on which he bases it. But it has been my observation that dogmatic utterance carries weight with the average man and that an excess of logical argument arouses his suspicion that you are trying to bolster up a weak case. Therefore, the keynote of my approach is always sounded by a positive and unequivocal statement.

The foregoing will give you an idea of some of the things I subtracted from my own estimate of myself in order to discover an average

man. There were a good many qualities I did n't have to subtract from myself, because I found that a majority of other men also possessed them. Vanity is one of the qualities I did not subtract. I have never known a man who was not vain. Perhaps the vainest man is the one who most thoroughly suppresses the usual manifestations of vanity.

It is a safe assumption that every man is vain, and naturally my average man is vain. How shall we deal with his vanity when we approach him? Every one likes flattery, but it must be most delicate and casual if it does not excite suspicion. In other words, while your flattery may gratify me, it also makes me question your motives. Flattery has no proper place in approach. If used at all in salesmanship, it should be after you have gained attention and are well into your subject. It took me a long time to learn that you should n't attempt to flatter a man when you first approach him. After I gave up word-flattery, I tried to look flattery. For example, I would gaze around a man's store or office in a most

admiring way before introducing myself. I thought this was subtle enough to create a glow of satisfaction without an aftermath of suspicion, but I could never trace any good results to the practice, and finally abandoned it after a rather disconcerting experience with an old German, who attributed my scrutiny of his place to an intent to appraise his stock of merchandise for Dun or Bradstreet. It seems that their repeated requests for financial statements had incensed him and he surmised that they had finally sent out a spy in the person of myself. While his contrition for the error resulted in an easy order, the incident convinced me that a salesman's approach should be unmixed with any form of flattery. If the flattery is strong enough to make an impression it is strong enough to set in motion the suspicions of your prospective customer, even though his suspicions do not take so absurd a form nor are so frankly revealed as those of the irascible old German.

Then, what regard shall we have for the average man's vanity when we approach him?

I am ashamed to tell you where I discovered the answer to this. A good many years ago, a friend who knows the underworld pretty well introduced me to some of its more or less celebrated characters. One of them, a confidence man, explained to me, "It 's all a mistake to salve a man when you're trying to get him hooked. You want to act like you don't think he's got the brains or the coin to go through on your proposition. Put it up to him, so he'll have to hook himself in order to show that your opinion of him ain't high enough."

This roughly phrased fragment of philosophy did not make much of an impression upon me until I began to test it in hypothesis upon myself. Then I realized that an almost certain way for another to gain my attention would be to imply the lack of some quality in me which I believed myself to possess. Of course, if the implication was made in an offensive form, my antagonism as well as my attention would be aroused. Evidently the implication should be very faint; just enough to make a man concentrate his mind upon you — if

for no other purpose than to prove to you that he is a bigger or a cleverer man than you seem to realize.

The proper application to salesmanship of our confidence man's theory of approach dawned upon me at last: Ask an inoffensive question. Make that question almost the first speech in your approach. Suppose you are selling saws. If they are high-priced saws, ask this question the instant you can get your man to look you in the eye: "Have you an organization that can sell a very high-grade saw?" There is no possible answer he can make which will put you on the defensive until he yields you his attention and invites you to talk, which is what you are there for. Let us construct a few answers a buyer might make to such a question:—

(1)

Buyer. We're doing it now.

Salesman. I guess I don't make clear to you the kind of a saw I mean.

Buyer. Well, what kind do you mean?

Or (2)

Buyer. We are handling the best saw on the market now.

Salesman. I'm talking about a different kind of a saw.

Buyer. What kind are you talking about?

Or (3)

Buyer. What we've got satisfies us.

Salesman. But could your organization sell a high-grade saw? (Which brings the buyer back to where he was in the first place.)

If a saw salesman asks the question, "Have you an organization that can sell a very high-grade saw?" and his rejoinders to the buyer's questions are a polite but emphatic reiteration of the original thought, the buyer must finally invite an elucidation of that thought.

Any similar question will serve. Please fix this point in your mind: You have n't properly analyzed your goods if you can't frame an inoffensive attention-getting question for

use in your approach. The other day I was talking to a man who sells prints to shirt-waist manufacturers. He said, as nearly every salesman will say, "My line is different from any other." He also said, "There is no question I could ask a manufacturer of shirt-waists, except to request him to look at my samples."

I asked him to name the chief talking point about his goods. "The prettiest Parisian patterns in advance of competitors," he replied.

Then I suggested: "Suppose you said to a manufacturer, 'Have you any trade that would appreciate a pattern that is a positive craze in Paris right now — not yesterday but to-day?' What would the manufacturer say to that?"

"Why, he'd say, 'Let's see it,'" was the answer.

"Is n't that what you'd want him to say?" I inquired.

"Gee, I guess that's right."

It's so simple that it sounds foolish — but every truth is simple in its final analysis.

So much for vanity. Now, I have observed that my eyes can deliver a message to my brain more quickly than my ears. I have observed the same of others. I have noticed, too, that my attention can be focused more completely through my eyes than in any other way. Accordingly, I always like to have some object to place before the eyes of my prospective customer. If possible, it should be the article you are trying to sell or some portion of it. If that is impossible, then you should have a picture, a newspaper clipping, or an unusual testimonial. The best time to show this object is right after you have cornered the buyer with your question. If you are selling a saw, wait until you have forced the buyer to ask you, in effect, what kind of a saw you are talking about. Then pull out one of the saws or a piece of steel, and say, "There it is," or "There's what it's made of." The most cynical buyer cannot avoid a distinct feeling of interest in any object that is placed in his hands — even if it is merely a coffee bean.

Give him a dramatic moment in which to

examine the article you have placed in his hands. Then make the assertion which you have selected as a means of fairly transfixing his attention. This is what I have referred to as the keynote of approach. Such a speech should be as brief and emphatic as you can make it. If it succeeds in its purpose, you have won attention, and you may pass on to the second step of your attempted sale — the development and enlargement of your auditor's interest. If it fails, you should go over the same ground again and again with a variation of words, but not of thought or purpose, until undivided attention is finally yielded to you. Do not make the blunder of attempting to expand your customer's interest until you are certain you have fixed his attention on the identical subject in which you desire to center his interest.

I have used a good many words in discussing how you should plan your approach to the average man, but I have by no means touched on all the traits of the average man which should be considered in planning the

first step of a sale. However, if I have made clear my method of plotting against the poor fellow, I have accomplished enough. You probably know him as well as I do, for he is as much like you as he is like me.

We are now at the point of considering this mystery-enshrined problem of "sizing up your man," or "reading his character," or whatever you choose to call it. To show you how important I consider it as a factor in applied salesmanship, when compared with the importance of constructing a true image of an average man, I shall dismiss the subject with a very few words. You don't read a man's "character" when you see him. If you size him up, it is merely to observe, for example, whether he is deliberate or impetuous, phlegmatic or volatile, serious or flippant, placid or irascible, courteous or ill-mannered, patient or impatient. Naturally you try to harmonize yourself with those phases of his temperament which are most apparent. You speak quickly to a quick-spoken or nervous man. You are slower of speech, but no less emphatic, with a

deliberate man. You are self-assertive with an ill-mannered man. But why multiply examples of this so-called character-reading and its influence upon your method of approaching a prospective customer? It is largely instinctive, which is no doubt why many salesmen rely upon it in preference to premeditated speech and acts which require constructive thought.

When you get to know a man you will naturally adapt your manner of approach to your estimate of his temperament, but do not mistake the exchange of personal amenities for real attention-getting. The attention a salesman requires is not attention for himself alone. What he needs is an approach that will compel attention for some particular article in his line or some particular phase of his proposition. He does not want the merely tolerant attention of friendship. The salesman who places his reliance on the friendship of a buyer is backing a high-weighted horse at short odds.

As to the class of man you are approaching, — that is to say, whether he is the kind of man

who sits in a luxurious office or the kind who sits on the edge of a pickle barrel, — my advice is to disregard such distinctions. Act the way you feel, unless you happen to feel subdued by Turkish rugs and rosewood desks. In that event, don't act the way you feel.

One more word and I am done with the subject of approach. I can imagine a jobber's salesman saying that my method is not practicable for a man who sells an extensive line. In my opinion a great weakness in the methods of most salesmen for jobbing houses is that they do not base their approach on one specific article, but scatter fire. I shall enlarge upon this later.

Don't try to tell your whole story when you approach a prospective customer. A common and very bad introductory remark is somewhat as follows: "I am representing Smith & Jones of Johnstown. We make a very fine line of 'Thingumbobs' and I want to see if I can't interest you in our line." Whatever else you do or say, don't say that.

Attention may be called the dawn of inter-

est, if you can imagine a dawn that will turn tail at the slightest excuse and slip back into the darkness whence it came.

Perhaps it is closer to the mark to say that attention is a challenge, since the man who gives you his attention yields a temporary interest which his mind challenges you to hold.

Real interest is involuntary mental concentration; forced interest is an unwilling captive; and feigned interest an amiable deceit. It is never safe to assume that any talking point is of inherent interest to a buyer, nor that you can interest him in your goods merely by describing their good qualities in a convincing way.

I never knew any one to buy a photograph of a banquet which he had attended if the photographer failed to get him in the picture. If I wanted to impress Niagara Falls on a man's mind so that he would never forget the scene, I should photograph the falls with the man in the foreground and give him a copy of the photograph. If we want to hold the

interest of a buyer as we describe our goods, we must keep him in the picture.

Our average man is always interested in himself. If we are trying to sell a high-priced saw and ask the buyer, when we approach him, whether he has a sales organization that can sell a very high-grade saw, we gain his attention because we touch his vanity, and we attach a tether rope to his interest because we make the quality of our saw part and parcel of the buyer's consideration of his own sales ability. We gain momentary possession of his interest, but if we proceed to talk about ourselves and our saw without bringing him into the story, his mind is likely to pull the tether pin and gallop off to the consideration of other subjects.

A buyer's interest in the quality of your goods can be developed to the extent only that he sees in their superior quality a means of increasing his own business profits or prestige. A quality talk should always be from the standpoint of the buyer as a seller and in the identical terms that he would use in selling

your goods to his own trade. If the buyer is a jobber, take him with you on an imaginary trip over his territory and talk to his trade about your goods. If he is a retailer, place yourself behind his counter in your imagination and talk to his patrons. In addition to convincing a buyer of the superior excellence of your merchandise, you must also convince him that he can convince his trade.

The test of the buyer's interest in your description of your goods is whether you have made him forget that he is a buyer. It is necessary to bring him into the picture as a seller and make him see himself using successfully with his trade the same quality talk that you are using with him. If you can make a buyer desire to remember what you are saying to him so that he can say the same thing to his own customers, you have captured his real interest in the quality of your goods — and short of that you have n't.

"Was unable to interest him." I don't know how many times I have read those words in traveling men's reports. I may have

used them myself when I first went on the road. It is a confession that no salesman should have to make. He might as well report: "I saw Jones, but I could n't get him to look up from his desk." A salesman can always get attention and develop some degree of interest. Yet there are thousands of salesmen who do not always successfully negotiate these preliminary steps of a sale and many of them fail without knowing they have failed. The other day a salesman thanked me for my attention and my interest in his proposition, when, as a matter of fact, my attention had been directed to the circumstance that he was wearing a blue cravat with a brown suit and my interest engaged by the peculiar conformation of his ears. Nor was my frivolity responsible for this. The man had a fair chance to transfer my attention to the thing he had to sell, but because I looked at him he believed he had all of the attention necessary. He could have excited my interest in something besides his ears if he had brought up any point of real interest to me. But he did n't. He took

up his allotted time in talking about things that interested him, and because I listened he imagined that I was interested.

I cannot lay too much emphasis on the point that the way to arouse a merchant's interest is to put yourself in his place and talk to his trade instead of to him. One of the best salesmen I know carries with him an imaginary person whom he calls Mr. Dinkenspiel. This salesman sells all his goods to Mr. Dinkenspiel. He will start in something like this: —

"Now, there is Mr. Dinkenspiel up at Worcester, Massachusetts." "Dinkenspiel is such and such a kind of a man." "We go up to see Dinkenspiel." "Dinkenspiel says 'so and so.'" "We say to Dinkenspiel 'so and so.'"

Dinkenspiel is the greatest cosmopolitan in the world, for he lives wherever this salesman wants him to live. He is the most versatile person in the world because he instantly assumes any character the salesman gives him. However, the buyer can always recognize one of his customers in Dinkenspiel and unconsciously becomes a seller instead of a buyer as

his mind follows the imagined sale to Mr. Dinkenspiel.

Every salesman should have a Dinkenspiel, and those who sell to retail merchants should have a Mrs. Dinkenspiel, to whom in fancy they can sell their goods over the merchant's counter while the merchant listens.

One final word on the second step of a sale. No matter how many different kinds of goods you have to sell, start in on a single article and keep the buyer's interest on that article until you have sold it to him or convinced yourself that he won't buy it. Even though you are traveling for a jobbing house and carry a catalogue as big as a dictionary, you should commence as if you had but one thing to sell. Actually sell something before you commence to rifle the pages of your catalogue and drone out your inquiries as to whether the buyer needs any of this or wants a little of that. Make a clean-cut sale right at the start, and subsequent orders will come a good deal easier and faster. I suppose this is a result of the meeting of minds which occurs in an actual

sale as distinguished from a voluntary offering in the shape of an order. After the minds of buyer and salesman have met in a real sale, they appear to synchronize more fully as the pages of the catalogue are turned. Perhaps this is n't the explanation, but the fact remains, and I commend the method to every jobber's salesman.

The third step of a sale is to nail down what you have previously said. In developing the interest of your prospective customer you will very possibly have carried him to a point from which there will be some reaction. You must expect reaction. It is better to have it before than after you get the order. Reaction after you have gone away with the order is very likely to mean cancellation. A countermand usually means that you overplayed your hand.

You have interested your prospective customer as you sketched the possibilities of your line and told him of its good qualities. You have sold the goods to Mr. Dinkenspiel and your customer has heard you do it. While he

listened he ceased to be a buyer and in his imagination became a seller. But before you get his order he becomes the buyer again. You have made him comprehend what you claim for your goods in quality and salability. The next step is to bring him to a full belief in and accord with your statements — by making him see a profit.

He wants to make money. You must show him certainly and definitely how your goods will make money for him. If they are priced at such a figure that he can't derive an attractive direct profit from their sale, you must be able to show him how they will build up his prestige and trade, and give him the desired profit indirectly, if not directly.

No matter how excellent your wares may be, no matter how satisfactory they will prove to the trade, no matter how easily they can be sold, our average man insists on seeing a satisfactory profit in them in some form or other before he will give you his order.

I have heard salesmen say: "Yes, I know, Mr. Jones, the profit on our goods is a little

less, but consider the satisfaction of handling a line like ours." The satisfaction which a merchant gets from handling a high-grade article is secondary to the satisfaction he experiences in making an attractive profit. I have never known a merchant to place an order for goods merely that he might have the satisfaction of handling them. Tradesmen handle merchandise for the profit. Postage-stamps ordinarily yield the apothecary no direct profit, but his postage-stamp business extends his trade and affords him an indirect profit. The grocer may handle certain widely advertised goods at an actual loss, but he has a reason for doing it quite apart from any satisfaction he derives from their sale.

Summed up briefly, the third step of a sale is to decorate your proposition with the dollar sign. The reaction which the buyer experiences after you have carried to the highest pitch his interest in the quality and salability of your goods will manifest itself in one controlling thought: "Can I make more money by buying these goods?" Don't let

him ask the question. Anticipate it. You know the climax of your quality-and-salability talk. Ring down the curtain on that line of talk when you have reached this climax and instantly ring up on your profit-making talk.

I have asserted that the third step of a sale is to nail down what you have previously said about your goods. Convince the buyer that there is a sure and satisfactory profit to be made from the sale of your line and you have confirmed to his entire satisfaction all of your previous claims. Up to the third step of a sale, talk quality just as fervidly as the truth will permit; then prove your statements by showing the buyer how much money he is going to make. Not because that really proves quality, but because our average man wants to believe the best of anything that holds forth a convincing prospect of more money in his pocket. Perhaps you say, "Then why not talk about the profit first?" Simply because profits in trade are not earned until sales are made, and the buyer's mind is not ready to consider the subject of profits until you have shown him

the possibility of sales. Sales before profits is the order of events in trade. Your sales arguments should be presented in the same order, for that sequence of thought occurs in the buyer's mind as he considers your proposition, and he cannot follow you attentively if your arguments are presented in a different sequence.

But in its proper place the profits talk is all-important, and every salesman should have at his tongue's end a definite and convincing statement and analysis of the profits that can be made from the sale of his goods. If you are a salesman and have n't a lucid profits talk in your repertoire, I beg of you to take pencil and paper to-night and work one out to the last decimal point, for the accomplishment of the third step of a sale depends on the buyer's ability to see a profit in store for him.

Now comes the fourth and final step of a sale. You have disarmed the buyer by showing the salability and the profitableness of your goods. He is ready for the final stroke. But remember that a buyer has wonderful re-

sourcefulness in negation. If you let the psychological moment slip by, he is likely to recover his shield of doubt and sword of disagreement and put you to rout. Don't let your opportunity escape. The instant you have reached the climax of your profits talk is the time to take the hazard.

I have referred to the faculty of divining the proper time to make the closing talk. It would have been better to define this as the ability to recognize the moment you have convinced your prospective customer that there is an inviting profit in your goods. When that moment comes, say to yourself: "Mr. Buyer, I know you're going to buy a bill of goods from me. You can't help it. The only question is how big a bill you're going to buy." However, while you are talking to yourself, don't give the buyer a chance to put an excuse or objection into words. A thought that gets into words is harder to combat than a silent thought.

The best closing stunt I know of is to outline an order. It keeps before the buyer's eyes the picture of sales and profits that you have

drawn and it keeps him in the picture. You say: "Now to start in on this proposition you 'll only need"—well, no matter how much he's going to need. You write it down, commenting on the virtues of the goods as you write. It is a curious fact that a buyer will seldom interrupt you while you are writing, and if you talk as you write, his mind follows your pencil instead of formulating excuses, doubts, and objections. When you have completed the memorandum of the goods you think he should buy, you pass it over to him and you say: "There's about what you ought to have as a starter." The expression on your face is a sort of compromise between the ferocity of a man-eating tiger, the wistfulness of a hungry dog, and the self-complacency of a hoot owl. What does the buyer do? He either buys or he does n't buy. You have cast the dice and you have won or lost.

I have not touched on special discounts, impending advances in price, threatened shortages of supply, or similar inducements and arguments that can sometimes be offered to

the buyer as a part of the closing talk. If the salesman can truthfully advance any such reasons why the buyer should place his order at once, they are a legitimate aid in taking the fourth step of a sale, but they are not an essential part of salesmanship.

I have nearly completed what I have to say about salesmanship, the rule-of-thumb science. Its fundamental rules are few and simple. Their application depends upon your estimate of yourself and the average man with whom you have to deal. Your thumb may be either longer or shorter than mine — hence salesmanship must always be a rule-of-thumb science.

It has required some restraint to refrain from anecdotes to illustrate the points I have attempted to make. Illustrative stories are almost habitual in articles on salesmanship — so much so that the illustrations usually submerge and obliterate the points intended to be illustrated. You no doubt know as many stories as I, and I leave it to you to find your own illustrations.

I should be entirely through now, except that a man who knew that I was writing this chapter said to me the other day: "I want to read what you say about personality. That's the important thing in a salesman, and it's a thing that's born in a man. It's something he can't acquire."

To avoid disappointing this gentleman I must say a few words about personality.

Personality in salesmanship is merely the radiation of self-confidence. Be sure of your ground and you will have a convincing personality. Some people are born with self-confidence. If it stops short of offensive egotism, they have a certain inborn personality. But personality is more frequently acquired than inborn. Don't worry about it any more than about character reading. Know your goods thoroughly, master and practice the fundamental principles of salesmanship, and personality will descend upon you like a halo.

II

OVER-THE-COUNTER SALES

ALTHOUGH I have never sold a pound or a penny's worth of anything over a counter from the inside of the counter, I nevertheless approach the subject of retail salesmanship with the utmost assurance. A nearsighted paralytic, criticizing Ty Cobb's method of running bases, could not feel more secure than I do when I talk about selling goods at retail. Furthermore, it is a subject that delights me. I feel that I am dwelling on wrongs which I have personally suffered. My views on retail salesmanship are largely a recital of grievances, grievances that have arisen in trying to get retailers to sell goods for me, and grievances that have resulted from trying to get them to sell goods to me.

I have some money in the bank that probably would n't be there — in my name at least — if a little real salesmanship had been

practiced on me. There are a number of articles I have wanted for a number of years, but still lack, although I have examined and priced them repeatedly. This I consider conclusive proof of a prevalent low order of retail salesmanship. I know that I would be susceptible to salesmanship. I know that I would yield to it to the full extent of my purse — or the credit man's estimate of my credit worthiness. Hence, since I don't yield, it must be that I have not encountered salesmanship.

Come with me and let us visit the retail shops. At the threshold or the counter, according to the character, size, and system of the place, we are greeted. If either of us is personally known to the merchant or his clerk, there are, of course, the salutations of acquaintance, varying with the extent of the acquaintance and the esteem which it has engendered. But whether or not there are the obligations of acquaintance to be discharged, we are fairly sure to hear a certain seven words or their equivalent.

"What can I do for you to-day?" is as com-

mon a phrase in retail stores as "F. O. B. Factory" in a manufacturer's price list. I defy any one to say to me, "What can I do for you to-day?" without offending me.

What can a retail salesman do for me? Not a darned thing. I admit he is doing me a favor by being there to take my money and give me what I want, but I don't like to be reminded of it. I like to feel that I am conferring a favor on him. I could go elsewhere or I could send my money to a mail-order house and enjoy all of the sensations of a man who has bought a lottery ticket or advanced railway fare to a marriage-bureau photograph, and I don't want a merchant or his clerk to talk as if he were renewing a note for me when I come in to pay cash for a pair of suspenders.

A merchant builds his shop, arranges his wares and advertises them for the purpose of enticing you to his place of business. You come in response to his invitation, and then he or his clerk bristles up and says, "What can I do for you to-day?" in a manner that nine times out of ten seems to imply, "What

do you want in here? Speak quickly. Time is money with me." Of course the salesman does n't usually mean it that way, and the average customer does n't take it that way, but one must practice a good deal to be able to say "What can I do for you to-day?" in an essentially different way from "What can I do for you, my man,—or my good woman?" Try it.

However, the real objection to "What can I do for you to-day?" is that no matter how the words are spoken they mark bad salesmanship. The phrase is a plate-glass-windowed, mahogany-fixtured, clerk-unionized, and ungrammatical corruption of the mediæval street-vender's cry, "What do ye lack?" It is meant to signify both an ability and readiness to supply the needs of the prospective customer, but in reality expresses a doubt of both. Grammatically and psychologically it should be, "What may I do for you to-day?" However, that amendment does not remove the objection to the phrase. The trouble with this salutation and all of its varia-

tions, such as "Something to-day?" "What may I show you?" "Looking for something?" "Waited upon?" etc., is that the salesman throws away an advantage when he uses them. Some real or fancied need has sent me in quest of a certain article. Advertising, habit, convenience, or other circumstance directs me to a particular store. The sale is half made before I enter the store. This is true even though I am not yet ready to buy and am merely looking around. I have a keen interest in the object of my quest, and am ready to yield an absorbed attention to the article and a description of its merits. Compare my attitude with that which the wholesale buyer ordinarily assumes toward a traveling salesman, and it is apparent that I have produced in myself a state of mind that the traveling salesman rarely encounters in his customers until he himself has created it, and he fails in many an attempted sale because he can't create it.

I walk up to the counter with a mind full of interest in and a heart full of desire for at least

one article of merchandise. I have no intention of concealing why I came. I am ready to make a clean breast of the whole matter as soon as I can get the attention of the salesman. All he has to do is to bow politely and smile and say, "Good-morning" or "Good-afternoon," and then I will say, "I want to buy a stiff hat," or "Let me look at some shirt patterns," — just like that. But the salesman does n't do it that way. He does n't take it for granted that I've come in to buy something. For all he knows I may have come around to read the gas meter, and if I have he intends to tell me politely but firmly that the store has n't used gas for ten years. Accordingly, in a cold and dignified way, for it does n't do to be too cordial to an entire stranger, he asks me, "What can I do for you to-day?" It has almost the same effect as the warning, "Whatever you say can be used against you," that the British constable is supposed to mutter as he fastens the handcuffs on his prisoner. Instead of bubbling over with my intended confidences concerning the

thing I want to buy, an instinctive caution curbs my tongue, and I answer with a vast assumption of indifference, "Oh, I don't know; you might let me look at a stiff hat; the one I have on is pretty good yet, but I may get a new hat some day."

What size, what price, what color, what shape? I make him fight for every necessary detail. He has obscured in my mind the fact that I came in expressly to buy a hat. He has injected his own personality into the matter and made it a personal question of whether he can take down enough boxes and brush off enough crowns and clap enough hats on my head to force me to take one away with me, rather than feel his indignant eyes boring through my back as I walk out. In short, it becomes a question of physical endurance on his part and of moral courage on mine.

I may have seen a hat in the window that I liked; perhaps a friend has lately bought a hat that I admire; possibly a favored shape is current in the magazine advertisements. All of this would have been revealed in one gener-

ous burst of confidence if he had given me a chance. Then he could have said: "I know exactly what you want. I have it here and it's just the shape for you; by the way, what size do you wear, and would you rather have it in a black or a brown? — suppose you have a look at both — seven and three eighths? Yes, sir, I have it in both colors in that size."

If I were a retail salesman I would learn to bow and smile and say, "Good-morning" to my customers in a way to show without words that I was ready to move mountains for them. I would n't ask a customer what he wanted. I'd wait for him to tell me, and meanwhile I'd observe his appearance, speech, and manner to get the right cue for my first remark.

Something has brought your customer to the store. He is partly sold when he walks up to your counter. The advertising department, the window-trimmer, the location of the store, previous dealings with the concern, some force or circumstance has delivered him to you in this partly sold condition. When you see him coming, you don't know how close to

the buying point he is, but if you let him tell what he wants in his own way, without befogging the situation by needlessly asking him what you can do for him, the chances are that his remarks and manner will give you a pretty good idea of how far he has progressed toward a determination to buy the article about which he inquires.

A salesman's talk during business hours should be selling talk, and outside of a single word of respectful greeting, a retail salesman's first remark to a customer with whom he has no acquaintance should be something that will further the sale of the article in which the customer expresses interest. This remark should come as soon as the customer has stated what he wants. If he has named a specific choice of brand or style, or both, and you have the line and are sure you can fit him, if it is an article where fit figures, there is nothing to do but express commendation of his selection, ask his size, and show him the goods. This is even true if the line he asks for is in competition with another line you are

trying to push. The time to show a man a brand that's "just as good" — or better — than the brand he has asked for is after you've shown him what he's asked for — if you have it. And don't withhold your commendation of the line he asked for just because you intend to try to kill its sale. When a customer asks for the X Y Z brand, show it to him and praise it as much as it deserves; then bring out the A B C brand which you are pushing and praise it as hard as it deserves. Generally this method will get more consideration than any other for your A B C brand, and it has the obvious virtue of not imperiling the sale of X Y Z or offending the customer if he is a partisan of the latter brand.

Suppose, however, you don't carry the brand asked for? Will you disparage it, damn it with faint praise, or heartily commend it? From the standpoint of the buyer, I should say commend it before you show the brand you do carry. But you should be very quick on the trigger with the strong points about the brand you carry. It should be remem-

bered that the immediate sale is not the only thing at stake. There is the reputation of the house to consider. "We don't handle that brand" is a damaging admission to make unless, without disparaging it, you can show why you have something as good or better.

Personally I don't think much of the "just as good" argument. There are mighty few dead heats at the race-track, and there are mighty few persons or things of exactly equal quality. I don't know of any two brands of any article that are equally good. If your house carries one in preference to the other, you have a right to believe it is the better, and it is up to you to dig up facts that will support your belief.

Going back to our customer, let us assume he asks for a given article without naming any brand or style. This leaves you perfectly free to try to sell him what you like, but it also leaves him equally free to say, "Thank you for your trouble; I believe I'll look a little farther." In such a case, before any goods are shown, I think something should be said

to link up the personality of the prospective buyer with the article about to be shown. Assume that a man in a brown suit inquires about cravats. The salesman says, "I have a new brown here — a distinct novelty — and it would be perfect with that suit you're wearing now." Perhaps that won't sell the brown cravat, but it will make it mighty hard for the customer to leave without buying some kind of cravat. Suppose, instead of a cravat, it's a hat the customer is after. The clerk says, "We have a shape here — one of our latest — that I believe will set off your profile exactly." Who could help getting interested in the hats of a concern which took such an intelligent and flattering interest in the appearance of its patrons?

Perhaps a bride and groom come into a furniture store and say, "We want to look at a dining-room suite." Instead of asking a long rigmarole of questions about what they want until they feel like alibi witnesses under cross-examination, suppose the salesman says, "I want you to let me show you one or two

examples of what we are doing in the Periods, and then we'll look at some of our other specialties." They may wonder what year Chippendale played on the Carlisle football team and whether Sheraton in his day was as good a horse as Whisk Broom II, but, nevertheless, I am sure it will be easier to sell them that special $40 golden oak set and harder for them to break away and go up the street to Solomon's, if the salesman pays them the compliment of talking about the "Schools" and drops gracefully down to that ever smart and sensible stand-by, "Golden Oak" in "Grand Rapids Renaissance." Besides, there is always the chance that they will take the rubber band off the bank roll opposite one of the "Louies."

Maybe a sturdy stranger comes into a hardware store and wants to buy a hoe. There is n't any difference in the piston displacement of hoes, except as measured by their width and depth, but there is a tremendous difference in the way hoes act. Some hoes "scour" without a bit of trouble; others re-

quire a long course of treatment. Some have handles that seem to balance in your hands and hurl a menace at every weed in Christendom. Others are as unwieldy as a flatboat's sweep. The selection of a polo mallet or golf club is n't a mite more momentous than the selection of a hoe, for the man who is far enough over in the book to come in and personally select his hoe is just as much of a sportsman as the poloist or golfist. Then why not recognize the niceties of hoecraft and say, "I know just what you want — a really good hoe — one that will scour and that has a perfectly balanced handle. Try this one." Your customer is not only going to buy a hoe, but he is also going away with the conviction that you and your store know how to cater to true hoe-lovers.

Some one speaks up and asks, "How about the stickers?" There is a very simple answer to that question. In the first place, what is a sticker? A sticker is something you can't talk about to some one in a way to make "your talk stick," as they say on Forty-fourth

Street. What is one man's meat is another man's poison, and the other way around. What you would n't buy because it's out of fashion or crudely colored, I might purchase because I don't like the prevailing fashions or do like something odd. Salesmanship never fears stickers. In fact, stickers don't thrive around salesmanship.

Speaking of stickers, there is a hotel on Broadway at — but no, for it is the only hotel at that corner. Anyway there is a certain hotel at which I frequently lunch and am invariably served by one of two waiters. One is a German who, for example, will say, in a matter-of-fact way, "Do you vant some curry of chicken to-day?" I immediately reply, "Curry of chicken, eh? That's the dish you're pushing to-day, is it? No curry of chicken for mine; fetch me a piece of roast beef." The other waiter is a Swiss. His method would be to remark solicitously as if to spur my flagging appetite, "Ah, monsieur, you are not very hungry — something delicate — yet with piquancy — and nourish-

ment. Let me fetch you some of the curry of chicken." And I would say, "Yes, I guess that's what I want." In other words, there is no such thing as a sticker if the article is an honest article — and no good salesman should soil his hands with a dishonest article.

Perhaps some salesman who lives in a small town and knows everyone who comes into the store will say, "Your ideas of handling a customer may be all right in a large city, but they don't apply in my town, where I know everybody, and they would talk me to death if I did n't break in and ask them whether they want to buy anything."

A community where the salesman knows everybody — or nearly everybody — is a place where he can't afford to alienate a customer, for customers are too few. No discourtesy sinks deeper or rankles longer than the busy signal. If Deacon Pettijohn is trying to tell you how that May rain made him three tons of clover to the acre when in April he did n't think he would get over half a ton, it will pay you to listen to him until he gets

through. Don't scare him off by asking him what he wants, for he may be figuring on buying a clover huller, and who would feel like buying a clover huller from a salesman who breaks in on one's story and says, "What can I do for you to-day?" There are only two reasons why you should n't listen to Deacon Pettijohn. One is because you want to wrap up ten cents' worth of tenpenny nails that old Squire Scoggins will call for after the five-o'clock train gets in, and the other is because somebody else is waiting to be waited on. In the long run Squire Scoggins's nails are not so important as Deacon Pettijohn's clover crop, and, anyway, you 'll probably have plenty of time to get the nails ready before the squire gets back. And even if you don't, the chances are the old squire will be content to wait and gossip while you're weighing out the nails. Don't let an order-filler's job interfere with a salesman's career.

But suppose somebody else is waiting while the deacon rambles on about his clover. In the first place, since you know the deacon as

well as you do, the probabilities are, the fellows who are waiting know him quite as well. They may be interested in what he says, for such is the way of people in a community where everybody knows everybody else. Anyway, there is a way of telling people that they're next and keeping them pacified without saying a word. If you have ever been pantomimed on to the waiting-list of a barber shop by an Italian head barber, you know that this is true. Don't worry about Deacon Pettijohn: let him ramble on. He may have to buy something to put the proper climax in his story. It always pays to humor a customer, and it never pays to try to rush a retail customer until you get his nose in the gate. If you ever tried to drive a pig into a pen you know what I mean. I have been rushed and I act like a pig — or worse.

Doubling back on my tracks, let me pick up a point that I failed to get down in its proper place. Judging from my own experience as a shopper, every shop and every salesman has to deal frequently with people who want a cer-

tain style (not brand) that is n't in the store. To illustrate: Last summer the choking collapse of a starched collar inspired me with the idea of buying some of those soft, unstarched collars that for several years, at intervals, have bid for public favor and offered the alternatives of safety pins or linked buttons as a method of draping their clinging comfort around one's Adam's apple. Safety pins are not safe in the hands of any man, and the linked buttons which a valetless man has to coax into his dress-shirt are likely to prejudice him against the entire species. Therefore, when the collar manufacturers came out this summer with a soft collar that required neither safety pins nor links, and looked perfectly stunning as demonstrated by the appearance of the modernized Lord Byrons whose portraits appeared in the advertisements, why should n't any one rush to his favorite haberdasher and ask for a half a dozen. No reason in the world why he should n't — and I did. I went to a place in New York which even the Evanston people admit is as good as any store

in Chicago, and is constantly quoted to settle necktie and pajama arguments as far west as Cleveland. Would you believe it, this store did n't have a single one of these new soft collars. The only kind of soft collars they had was the kind that pins together with a safety pin. They could make anything I wanted by the end of a week. Meanwhile I could go without a collar if I wanted to avoid a chafed neck. The latter suggestion was not put into words, but as a practical man I could see that the proposition figured out something like that.

Being also a man of action, and no effort having been made to disabuse my mind of the idea, I continued my search until I found the pinless and linkless variety. I bought some, but I have n't worn them much, for I can't get them to hug my neck the way they cling to the necks of the men in the advertisements. Instead of that they spraddle out and make me look like Abraham Lincoln around the gullet without causing any of the rest of me to resemble the great emancipator. Now I am pretty sure that the salesman in the first shop

at which I called knew exactly what sort of experience I would have with the pinless and linkless collars. He could have sold me $3 worth of the other kind and a $2.50 safety pin if he had tried. My wilted linen collar and my obvious air of discomfort told as plainly as words that I wanted to experience the comfort of a soft collar immediately. Suppose he had said: "Those pinless and linkless collars are great for any one who likes to wear a detachable collar at tennis, golf, or yachting; also, some people prefer them to a stock in summer-time for horseback riding. We make them to order, and we can have some ready for you by the week-end, but if you want something to wear to business during this sultry weather I'd suggest the collars that pin together, because the others seem to give better satisfaction for outing use than street wear." It may sound foolish, but I would actually have fallen for that line of talk; I really would, and the chap who was along with me would have fallen for it, too, — he admits it.

It has taken a dreadfully long time to tell about this trivial incident of the soft collars, but the time has not been wasted if the incident serves to illustrate how easy and yet how important it is to explain — without seeming to explain — why you don't carry a certain style of a given article. It all gets back to knowing your book, as the actors call it, and I want to talk about that again a few paragraphs further on.

Speaking of this shop where I did n't buy the soft collars, I have observed a most curious state of affairs therein. The store building was apparently at one time what they would call in St. Paul a "Duplex." In other words, it was meant to be two stores, but was finally condensed into one. The dividing wall between the two storerooms has retreated about fifteen feet from the entrance and yields a similar passageway at the rear. There is as much difference between the right and left hand sides of this wall as there is between the climate in Medicine Hat and Mobile. Upon entering the shop, if you turn to the right,

you feel, and are treated, a good deal as if you were trying to loaf around a club to which you did n't belong.

The salesmen on the right-hand side of the dividing wall act like a bunch of "we Harvard fellows," and appear to have a certain amount of contempt for anybody who wants to spend his money with their employer. On the other hand — that is to say, on the left-hand side of the wall — the salesmen seem to appreciate it when you come in, and are about as competent a lot of retail salesmen as you will ordinarily find. I have bought a good many dollars' worth of merchandise on the left-hand side, but only one dollar's worth on the right-hand side. The salesmen probably migrate from one side to the other as promotions occur or stress of trade requires it, but the characteristic atmosphere on each side of the wall remains unchanged. At least, my observations during the past five years, based on visits so frequent as to exclude the theory of coincidence, have marked no change.

I mention the foregoing, to me curious, fact

because I believe it illustrates a vital problem of retail salesmanship, namely, the tendency of retail salesmen to adopt unconsciously the traditions that hover over the counters they serve, and envelop the particular kind of merchandise they happen to be selling. Or perhaps it is a phase of self-consciousness which prompts them to be no more eager, original, alert, or courteous than their co-workers or predecessors. I should say that the kernel of the matter is this: a retail salesman ought to forget that he belongs to a class of, let us say, overworked, underpaid wage-earners, and remember that he is an individual human being, whose success depends on his ability to interest, please, and influence other people.

A retail salesman is really one of the luckiest fellows alive. He is paid to take a course of instruction that Yale or Harvard could n't give him at any price, and if he wastes his opportunities he is just as much a ne'er-do-well as the college boy who divides his time in equal portions between New York and New Haven.

Knowledge is everything. A man can't go very far wrong on a subject he knows a lot about — and he can always make an impression when he talks about it.

A one-legged man who has studied foot-racing carefully and conscientiously can hold the attention and interest of any ten-second performer who ever broke a tape. A retail salesman should know intimately all of the goods in his department. His department may be the entire store or it may be only a ten-foot section of the store — that makes no difference.

I wonder how many retail salesmen really try to know all they can about the articles they sell. If the manufacturers' catalogues don't give all of the information desired, or if the salesman can't boil down from a catalogue the few pregnant remarks he wants to make in regard to a certain article, all he has to do is to send a post-card to the particular manufacturer concerned and say, "What do you think I should say when I put your goods on the counter before a prospective buyer?"

Manufacturers who buy space to tell about their products in "Collier's" and other magazines have certainly learned how to make the strongest selling arguments in the fewest words. They ought to be glad, and most of them are glad, to tell any retail salesman what they think should be said to the consumer about their goods.

Fancy an actor going on to play a part without knowing the lines or having any idea of the author's conception of the part. Yet the equivalent of this is what retail salesmen habitually do. Of course it's all right if a man is satisfied with his job and his pay, and can hold both at the gait he's going. But if a chap wants to get on and up, there's no quicker or surer way than learning the most convincing talking points about the goods he sells. To say that goods are "good goods" does n't convince the most credulous, but the reason why they are good will convince the most skeptical.

This is an age of commerce, but it is also an age of interesting industrial stories. Take pocket-knives for example. Every man loves

a good knife; yet how few high-priced knives are sold out of the hardware stores. There is a knife made over in England that nearly every first-class American hardware store carries in stock. I say carries in stock advisedly, for they rarely sell any. This knife is one of the few that has a hand-forged blade. You can see the marks of the hand-forging around the hilt — if a clever salesman points it out. Over in the English town where these knives are made the men who work in the knife factory are recognized at a glance by the bulging muscles of their right arms and shoulders, which show plainly through their jackets — and must be the despair of their tailors, if tailors they have. Isn't there a great selling story in this? There surely is, but I'll wager no knife-buyer ever heard it unless he has bought a knife from my friend Tom Williams, of Toronto, who told the story to me. For the life of me I don't know why a hand-forged blade will sharpen lead pencils or trim boot-thongs any better than any other kind of blade, but hanged if I would n't buy a hand-

forged blade in preference to any other kind, if I had the price — and so would lots of other charter members of the great American buying public.

There is one more point to be considered: How are you going to tell what you know? You become letter perfect in what you want to tell your customer about a certain article. You can do that easily enough, but are you sure you can tell your story in the most convincing way? If I were a retail salesman, I would n't be ashamed to practice before the mirror. Better men than I have done it in less worthy causes. And if I had the chance, I'd spill all of my talk into the recording horn of a phonograph and listen to the phonograph while it told me how bad a salesman I am. I'd keep doing that until I had improved.

III

"ANYTHING ELSE TO-DAY?"

"Now that you *ask* his name I can't think of it to save my life, although I know the name almost as well as I know my own." I wonder if you have ever had to make that admission to any one or whether any one has ever made it to you. Point-blank questions that call for an immediate and specific answer sometimes have a queer way of defeating their own purpose.

When a tearful little boy is sent back to the grocery store by his indignant mother because he forgot to get anything but sugar, although she had expressly instructed him to fetch both sugar and tea, it is my belief that nine times out of ten the grocer is to blame.

It was n't the ball-game with those boys over on the next street, as menacingly charged by his mother, that drove the tea out of the little boy's mind. It was n't that at all. It was

because the grocer, after expertly snapping off the wrapping-string and giving a final affectionate pat to the package of sugar, peered over his spectacles and said to the little boy, "Is there anything else to-day?" The little boy probably scratched his head, scraped his feet on the floor, and tried to think very hard. Meanwhile the grocer drummed the counter with his fingers and acted as if he'd like to get rid of the little boy, so he could go back behind the flour sacks and hunt for "fresh-laid eggs" with a candling outfit or look over the canned goods and pick out the "swells" which the jobber's salesman had authorized him to ship back for credit. Finally the little boy's memory went absolutely blank and he said faintly, "No, sir, I guess that's all."

Suppose the grocer had pushed the sugar across the counter and said, "There's the sugar; now I wonder what else your mother wants to-day." The little boy would probably have said, "Oh, gee, I 'most forgot. She said some tea, too; the kind she always gets."

Perhaps you don't believe it would have

made any difference. Perhaps you think the little boy would have forgotten the tea, anyway. I can't prove my contention and you can't prove yours, so there is plenty of room for argument. Most arguments start about things that can't be proved at the time and place of the argument.

My argument is that the question, "Is there anything else to-day?" when addressed to a little boy, is not a suggestive question, while "I wonder what else your mother wants to-day" raises a vision of the little boy's mamma in the little boy's mind and causes him to reconstruct in detail just what she said to him. He remembers that he was going out through the back gate with his catching-glove in his hand, when his mother called to him from the kitchen window. He remembers how regretfully he retraced his steps. He remembers that his mother said, "Jimmie, I want you to run down to the grocery." Mothers nearly always ask their little boys to run when going to the grocery store, but disapprove of "old cat" because there is "so much running in it."

Now let's see. What else did she say? Oh, yes. "The grocer did n't send up any sugar this morning and there is n't any tea for luncheon. Run down and get five pounds of sugar and a pound of tea." That was it. No tea for luncheon and no sugar to put in the tea. Careless of mother to run out of tea and sugar, and chase a guy down to the store when all the other fellows are playing ball, but that's what she wanted — sugar and tea.

Any good lawyer will agree that it is ordinarily easier to cross-examine the witnesses of the other side than to conduct the "examination-in-chief" of your own witnesses. In other words, it is easier to question people and confuse them, make them forget, get them to say what they don't mean, and tangle them up generally, than it is to ask questions that will bring out what they really know. When a lawyer is examining one of his own witnesses and the lawyer on the other side objects to a certain question on the ground that it is "leading and suggestive of the answer sought," the objection defines in legal phrase the most

effective kind of question that can be framed; but the makers of the rules of evidence, distrusting lawyers and witnesses alike, have decided that a lawyer must as far as possible be prevented from suggesting to his own witnesses by the form of his questions the answers that he seeks. This is no doubt a very wise rule, so far as lawyers and witnesses are concerned, but it is not in force outside of court-rooms, although one might be led to believe that retail merchants are bound by the same rule. "Is there anything else to-day?" or "What else?" are not leading questions, nor are they suggestive questions. On the contrary, they are questions that conform strictly to the rules of evidence. They are questions that give you no aid in framing your answers to them. Spoken, as they usually are, in the same tempo as a subway guard's "Step lively, please," they are more likely to make you forget than remember whether there is anything else and if there is, what it is.

"Is there anything else to-day?" is my idea of a perfectly useless question, and certainly a

useless question should never be propounded to a customer. The human mind is instinctively resentful of questions. Even a besotted and shameless drink "moocher" would rather have his victim say, "Come on and take something," than be required to answer the specific question, "Will you have a drink?" Ever since there has been a language in which to ask them, questions have frequently been the forerunners of trouble for mankind. From the somber question which the trial judge asks as he adjusts his black cap and tells the convicted murderer to stand up — from that kind of question down to the icy interrogation, "What time was it when you came in last night?" there are and have always been thousands of questions of ominous import. We human beings have inherited an animal-like question-wary instinct that invariably disturbs in some degree the normal operation of our mental processes when we are asked a question, no matter how innocent the question nor how great our readiness to answer it fully and truthfully. Of course, I have never

looked into a human brain as it was summoned to activity by a question, but I imagine that the brain thoughts come tumbling out to defend the requested information much as the soldiers of a beleaguered city turn out of their barracks to repel a night attack. While the more nimble brain thoughts are rushing out to reconnoiter the question and give battle if it seems unfriendly, memory is likely enough to become panic-stricken in the midst of the confusion and hide the answer where it can't be found by the other brain thoughts if they decide to let the question have it. The foregoing is rather fantastic and probably rather silly, but it is a fact that a point-blank, your-money-or-your-life question will frequently upset the normal working of the questioned person's mind and render him at least temporarily unable to make an adequate reply. Sometimes that is the very thing you want to accomplish, and when it is, there can be no quarrel with the question that brings about the desired result. Such questions correspond in purpose to a lawyer's cross-examination,

and have a very limited field of usefulness in retail salesmanship.

"Is there anything else to-day" can scarcely be regarded as an alarming or confusing question, yet I must confess that several times when I have stood at the counter, ransacking my memory for a mislaid mental shopping-list, this question, crisply put, has obliterated the last vestige of my recollection of the unpurchased articles, and I have as crisply replied, "No, that's all." Perhaps at the next corner I would be able to recall the other things I had intended to buy — with resulting profit to the merchant on that corner.

There is another minor objection to the absurd question "Is there anything else to-day" that I think we should consider before we pass on to the great big unanswerable objection. When you ask a man whether he wants anything else, it is merely an unintelligent way of asking him whether he has any more money he would like to spend. There are few stronger human impulses than the impulse to decline a perfunctory invitation to

spend money. Just the other day I half-unconsciously answered, "No, nothing else," when a salesman briskly inquired, "What else?" although it was necessary to correct myself immediately, for I actually did have another purchase in mind. If you restrict this objection to the possibility that a sale may be lost because the customer says no when he means yes, the objection is n't an important one. But viewed in the broad sense of what is and what is n't good retail salesmanship, I think we are going to find that this far-fetched little objection is closely allied to the big unanswerable objection.

This big objection to "What else?" and "Is there anything else to-day?" in general terms is the same as the objection to "What can I do for you to-day?" The use of such questions by a salesman indicates either ignorance of or indifference to the possibilities of salesmanship. We don't need to be so much concerned with the direct harm that these questions accomplish. That is relatively unimportant. The important thing is that such

questions are useless verbal weeds which choke the growth of salesmanship just as weeds in a farmer's field "kill out" his corn.

The retail salesman who first asked a customer "Is there anything else to-day?" probably intended to indicate an absorbing desire to be of further service to the customer. Sir Johnston Forbes-Robertson could probably speak these words in a way to express that meaning without any suggestion of smirking servility in his manner, but the average salesman cannot. Many salesmen, no doubt, realizing this and being too self-respecting to smirk, have abbreviated the question to a short and imperative "What else?"

There was once a time when retail salesmen ranked as servants in the household of the master tradesman. That time has passed, but many of the selling methods of that period have survived, although the servility of the tradesman's apprentice is somewhat lacking in their modern application. "Is there anything else to-day?" is a survivor of those

times — a sort of paraphrased survivor of "How else may I serve you, sir?"

No modern retail salesman considers himself a servant. As a matter of fact, he is not, and there is no reason why he should speak or try to adapt to his present condition the patter used by servants several centuries ago. While we are on the subject of servants, we might take note that even the well-trained servant has abandoned that hackneyed phrase "Is there anything else?" Since not all of us have servants nicely trained in the minute subtleties of speech and deportment that mark the perfect modern servant, let us on this point have recourse to Sir Johnston Forbes-Robertson's world, the stage, which, however false and fanciful in its teachings, is a preceptor to some of us in matters of which we have no adequate experience in our daily lives. The time was when the well-trained stage servant, after delivering to his master the brandy and soda, or the fatal message, or whatever it was, would click his heels together and ask in a significant way, "Is there anything else, my

lord?" His lordship, between gulps of the brandy and soda, or between sentences of the message, would look up and say wearily, "No, James, that is all. You may go."

Nowadays, if I am not misled by my observations, the stage servant does what he has to do, and then, to use the language of pantomime, "silently registers attention" until his lordship, looking up from the message or over the brandy-and-soda glass, discovers him and says, "That is all, James."

Forgive me for my digression, which I confess was unduly great, as I merely intended to inquire why a retail salesman should cling to a senseless and servile question that well-trained servants no longer use, and which, when unseasoned with servility, quite often has the flavor of impertinence.

No good salesman is either servile or impertinent; nor is he merely an unthinking automaton that mechanically exhibits merchandise, records a customer's purchases, and perfunctorily asks, "What next?"

When I come into your store and buy a

toothbrush from you, it is reasonable to suppose that I am not going to try to conceal my intention to purchase a tube of tooth-paste if such intent is in my mind. It is also a reasonable, or at least a courteous, assumption that I am in just as much of a hurry as you are, and that I will not unduly withhold a disclosure of the next article on my list. If I have other premeditated purchases of your goods in mind, I am pretty certain to indicate it by some word or act. Suppose my eyes stray over to and rest upon the contents of the safety-razor case. For the moment, perhaps, I seem to have become unconscious of your presence. Will you recall my mind from its consideration of safety razors by briskly asking me, "What else?" Will you test the genuineness of my interest in safety razors by asking me whether I want to look at one? Or will you quickly and deftly place a safety razor in my hands and make an appropriate commendatory remark about it? If you are a good salesman, I am sure you will do the last-named.

As long as a retail customer evinces the

slightest inclination to buy, it is the retail salesman's duty to help him buy. Don't question him; don't confuse him; just help him. If he does n't buy as much of a given article as you think he should, it is your privilege and your duty to endeavor to get him to buy a larger quantity, but I don't think it's good salesmanship to suggest such a thing unless you can offer a plausible reason for your suggestion.

An acquaintance of mine, who is fond of playing poker and fonder still of telling poker stories, was relating one the other day. It seems he thought he was playing with a group of solid business men, a delusion that most poker-players appear to have when they enter a game with strangers. The business men turned out to be "shillabers," if you know what "shillabers" are. I can't recall much of the story, but I remember that the "shillabers" tried to "boost" this gentleman and that he flew into a terrible rage and "dropped out of the pot and quit the game."

I am not a poker-player and accordingly do

not know how great an iniquity it is to "boost" any one in a poker game, but I do know that the average shopper does n't like to feel that he is being "boosted" by a salesman, and when boosted, is sometimes inclined to "drop out of the pot and quit the game" before he has completed all of his contemplated purchases.

The salesman of merchandise at wholesale usually has certain more or less convincing arguments for the buyer who proposes to order less than the salesman's estimate of his requirements. A retail salesman should be equally well equipped before he attempts to influence a customer to purchase more than the customer intended.

If I select a toothbrush and the salesman says, "How many?" or "Don't you want more than one?" or "Better let me wrap you up a couple," I think I should call that boosting. But if he says, "You probably don't let your toothbrushes get very old before you discard them. We have exact duplicates of the brush you have selected in case you care to

take several with you now, so that you will have fresh brushes handy whenever you want them" — if the salesman said that I don't think I should feel that I was being boosted. Or if the salesman called attention to another style of brush that could be used to advantage in conjunction with the one I had selected, I should n't call that boosting, either. Or again, if the purchase of half a dozen toothbrushes at one time involved a saving of ten cents over their purchase singly, I should feel grateful to the salesman who pointed out that fact, although my improvidence might prevent me from taking advantage of the saving. Effective or at least inoffensive boosting is the kind that suggests a benefit or advantage to the customer from an increased purchase. If it does not contain that suggestion, boosting is crude salesmanship.

My disorderly mind has carried us away from the question "Is there anything else?" Boosting — if the license of brevity permits that term — naturally comes before "What else?" and should have been discussed in the

previous installment of this series. No salesman, good, bad, or indifferent, will say, "What *else?*" until he has exhausted all of the selling possibilities of the first article the customer inquires about. Instinct teaches every salesman to make a sale or get a final and positive "You have n't got what I want," or "I won't take it to-day," before he asks, "Is there anything else?"

But why should any salesman ever ask any customer whether there is "anything else to-day"? Now we are back on the track again and we are running into a head-on collision with the question, "What else?" Why should a retail salesman ever ask any such question? The answer is he should n't. Now we have had our collision and let us get the wreckage off the track.

Some one remarks that a retail salesman's time is valuable, and that there are lots of customers who would waste it if the salesman did n't hurry them along. A retail salesman's time is valuable. I admit that. But its chief value rests on his ability to send each customer

away not only with a lessened bank roll, but also with an added appreciation of courteous and attentive service.

The mere fact that a man does n't hit you on the nose and make it necessary for both of you to go down to the police station is no sign that you won an argument from him without any hard feelings on his part. Just run for an office at the club or have a bond company ask him whether you use stimulants or narcotics, gamble or live beyond your means, have ever failed in business or made a composition with creditors, etc., and you will learn how he feels towards you — provided you can find out how he voted at the club election or what he said to the bond company. It's the same way with your customer. He does n't have to say "Damn your impertinence" or even develop a well-defined consciousness of wherein your manner and method failed to please him — he does n't have to do either of these things to enable him to go away with the impression that your store is run on the same principle as a subway station; namely, "How many?

Drop 'em in! Step lively!!!" In the long run, a store needs to make its customers like it. It may have the best corner location in town, the best goods and the lowest prices. It may have everything the real estate man could want to say about it in the "Businesses for Sale" column and more than the advertising man can conveniently tell within the limits of his appropriation. A store may have all that, but if some neighboring store excels it in courteous and intelligent salesmanship there are mighty likely to be some months when the treasurer hesitates at taking the cash discounts.

The man who has money to spend has a pretty well-developed idea of his own dignity and importance. He may not show it, but he feels it. If I have the price of a forty-cent collar and am willing to spend it that way, I am just as important — in a forty-cent-collar sense — as any belted earl who ever drew a belt around a lordly waist, and I want to be treated that way, — while I am buying the collar, at least. The most acutely sensitive

man in the world is the man who has money to spend. If he ignores impertinence, indifference, and unintelligence on the part of a salesman, it is because of his feeling of superiority; and what salesman wants to get by on that ground?

But let us get back to your drug store. I have bought a toothbrush — or toothbrushes. Perhaps I have also bought a safety razor. How are you going to know whether I want anything else, unless you ask me? An old lady is fumbling in her purse in a way to indicate the probable sale of a postage-stamp. There is a man at the cigar counter who is looking with interest at the cigars in the five-cent end of the case. A boy with a dirty face and excited manner has come in with a paper that looks like a doctor's prescription. A nervous and emaciated negro, ostentatiously holding a paper dollar in his hand, looks at you furtively. He has the appearance of a "coke" but maybe wants something that you can sell him without violating the law. The man who tends the soda bar is down in

the cellar. The prescription clerk is out getting shaved. You have the toothbrushes in one hand and the safety razor in the other. I stand opposite you and don't say a word. If there was ever a case that justified the question "Is there anything else?" this is it.

What should you say — or do? If I stand silently as described, I think you should wrap up the toothbrushes and the razor. You know it is n't imperative that all of my purchases be wrapped in one package. As a matter of fact, if each purchase is wrapped separately, I am likely to have less difficulty in storing them away in my pockets, and if I should finally decide to have everything "sent," you are out nothing but the extra twine and paper and the time spent in wrapping up the packages separately and waiting for me to make up my mind whether I want anything else. I don't know of any better investment in retail merchandising than this. When you have tied up the toothbrushes and razor and pushed them across the counter without getting a further rise from me, you have the right to

assume that I have no intention of making other purchases, or have forgotten what else I intended to buy, or am maliciously withholding the announcement of such other articles as I contemplate purchasing. If you think the question "Is there anything else to-day?" will recall to my mind some contemplated purchase that I have forgotten, or influence me to buy something I have had no previous thought of buying, or force the disclosure of something I wish to conceal from you, then by all means ask the question.

But, is such a question likely to refresh my memory — let alone stimulate my spending propensities? Lawyers, who are presumably the most expert questioners to be found, dearly love to propound leading questions when they are trying to extract the facts from their own witnesses and are not endeavoring to confuse and confound an opposing witness. As I have said before, "Is there anything else to-day?" is not a leading question, and it suggests nothing to me. If I have forgotten any articles that I had intended to purchase, this question

will not refresh my recollection. I am sure of that. On the contrary, such a question is more likely to have exactly the opposite effect. You will have to frame a different sort of question to recall my vagrant recollection. But need you ask me any questions at this point? A random question is a rather foolish thing in salesmanship. Questions that do not have a well-conceived purpose and fairly well-anticipated consequence would better be left unasked by salesmen.

If I stand silently at your counter after you have wrapped up my toothbrushes and razor, it is fairly safe for you to assume that I have bought all I intended to buy when I entered the store. It is safe for you to assume that you have received all of the voluntary offerings that I propose to give you, and it is up to you to commence to sell goods to me if you want any more of my money.

My purchase of a toothbrush suggests tooth-paste or powder. Possibly you have a new brand that you are pushing. If you have, it will do no harm to tell me about it. If I

assert my fidelity to some other brand, there is no harm in commending that brand, too. I might decide to ask you to wrap up a package of it to go with my new toothbrushes.

Razors suggest shaving-soap and brushes. You might ask me whether I have plenty of shaving-soap at home. I think that would be a fair question. As to brushes, I think it would be better to show me one without first asking me whether I am interested in brushes. You might say something like this, "If you need a new shaving-brush, here is one that I can recommend, because," etc.

If there is anything else that your store or your department is trying to push and which you believe I might be interested in, I think you would be justified in showing it to me or telling me about it, even though the old lady, the nickel-cigar smoker, the little boy, and the negro are still waiting and your associates have not yet returned from the cellar and the barber shop. Of course, you should be guided somewhat by your estimate of your store: that is to say, whether you regard it as an

emergency supply station or as a merchandising establishment. Ordinarily a bird in the hand is worth two in the bush, and if you signify to each waiting customer by a properly emphasized salutation that you are conscious of his (or her) presence, gratified at it, and intend to reward it with your undivided attention in a minute or so, no one is likely to become impatient on the sole ground that you are showing proper and salesmanlike attention to the customer you have in hand. I am not so sure about the old lady who wants the postage-stamp, but she is probably a pretty reasonable old lady, and after you have sold her the stamp with proper courtesy and consideration she is likely to go away in tolerable content.

We have been talking mostly about drug stores. I have purposely kept close to the corner drug store, for the conditions that exist in a busy drug store are about as unfavorable to the application of my theories of retail salesmanship as any conditions that could be imagined. I believe, however, that retail drug

salesmen could with profit to themselves and their employers do more of selling and less of perfunctory order-taking. If this is true of drug clerks, it is more true of most other kinds of retail salesmen.

IV

JUST LOOKING

MILLIONS of dollars are spent in advertising, just to get people to come and take a look. Every department-store advertisement is practically an invitation to come and look. The boss spends his money that way. Silly old duck, isn't he? As long as he has been in the retail business, he ought to know that the people behind the counter have no time for "lookers."

Of course there are several different kinds of lookers. The kind that Ziegfeld has in his "Follies of Nineteen and Yesterday" make more or less of a hit with salesmen — so do the Fifth Avenue kind. But isn't it an outrage that a self-respecting, time-valuing salesman or saleslady should have to be annoyed by a very ordinary woman who has been saving up for a piece of fur or a fall suit since July and comes around in September to look the lines

over, although she knows good and well that she won't be ready to buy before the second pay-day in October? That's the kind of looker the retail sales-people don't like. Am I right?

Dear salesladies and salesmen, your mothers probably saved and scraped and planned for more than one fall suit. Perhaps more than once a new frock for you, dear saleslady, or a new overcoat for you, dear salesman, made extra hard the saving, scraping, and planning for mother's fall suit. In your particular case, of course, I may be wrong about all of this. You may have come from a home of wealth or you may have been self-supporting from the day of your birth. In either case I apologize, but the fact remains that nine tenths of the merchandise sold over the counters of this country is bought by people who have to plan and save before they buy it. In other words, nine tenths of the buying public are lookers. They look before they buy. Nevertheless, sales-people detest lookers — detest nine tenths of their bread and butter, nine tenths

of the boss's profit statement, and nine tenths of the boss's bank balance.

The comic papers divide with shop girl sob-stories the responsibility for a large share of the antipathy and intolerance toward lookers. It's remarkable how we are influenced by jokes and fiction. Take mothers-in-law, for example. A man may have a perfectly lovely mother-in-law and all the mothers-in-law he knows may be pretty nice old ladies, but he ignores his own experience and permits the jokesmiths to prejudice him against all the mothers-in-law whom he does n't happen to know personally. It's the same way about lookers. The joke-makers have taken their fling at lookers, and the short-story writers have brought our indignation to fever heat by the story of how Katie Cooney stood behind the counter from 8 until 5.30 and valiantly stood off the lookers. At 11.59 a particularly crafty and plausible looker nearly tricked Katie into courteous service, but, refreshed at 12.30 by a cup of tea and a slice of toast, Katie came back and snubbed the

lookers to a standstill right up to 5.29. No, sir, never let them win a bet. Then she went home on the Third Avenue Elevated.

Rupert Hughes — dog-gone him! — can make me mad enough to bite a looker. But if it was n't for the way that he and a lot of other writers play on my sentiments and pull at my heartstrings when they tell me about Katie Cooney, I would very possibly wonder whether Katie, if she had taken a little more pains with lookers, might not have become the head of her department and been able to ride home in a taxicab on extremely bad nights, instead of doing a battle for life on the Third Avenue Elevated.

The lookers constitute a percentage which Katie Cooney can't beat. Over at Monte Carlo there is only one "O" on each roulette wheel, but the "O" comes up often enough to upset most systems of play. Think of the odds that Katie Cooney gives! The lookers are nine in ten, but Katie has no use for lookers. She puts all of her bets on the ready-to-buy people.

Now some one rises up and inquires: "Do you mean to say that only one shopper in ten is ready to buy? Why, in my department, I make sales to fully two thirds of the people who ask me to show them goods."

A question like this gets right at the root of the matter. It shows that we don't stop to think what lookers are. Nearly everybody is a looker. I am one; so are you; and so is Katie Cooney, when she finds the time for it. In spite of all that sales-people can do to stamp out the practice, looking is on the increase.

Now about your two thirds who buy when they look; do they buy every kind of article they ask to see? No! Then those who don't are lookers, for people who don't buy everything they look at are lookers. However, we don't need to count the lookers in that way. Let us assume that there are one hundred departments in your store; that ten thousand shoppers visit the store within a given space of time; that on the average each of the one hundred departments is visited during the aforesaid space of time by three hundred peo-

ple who ask to have goods shown; and that in each of the one hundred departments two thirds of the people to whom goods are shown make purchases.

Thus we have ten thousand people who take thirty thousand looks and make twenty thousand purchases. The looks exceed the purchases by ten thousand, and if we divide these ten thousand non-order-producing looks equally among the ten thousand people who entered the store, we make a looker out of every blamed one of the entire ten thousand. Of course, that can't be exactly right, because in the ten thousand there was probably some man who rushed in and matched up a piece of dress goods for his wife, ordered it "charged and sent," and then rushed away again without looking at anything else, except that flashy blonde in the glove department.

No, these figures are admittedly hypothetical, approximate, and inexact figures, but they serve to answer the question asked.

Most of the daily sales in department stores, and in a good many other kinds of stores for

that matter, are the culmination of previous looking, and an immense majority of those who make purchases to-day take occasion to look at other and totally different kinds of articles that they are not prepared to buy to-day, but intend to purchase somewhere at some time.

There is an endless chain of looking and purchasing. The looker of to-day is the buyer of to-morrow.

Nine tenths of the people in this country are lookers because their flat purses promote the prudent practice of looking and comparing before buying. As to the other tenth, if there are that many who need not concern themselves about the price of anything, I really think that most of them are lookers, too, for it must be admitted that there is quite a lot of fun in looking.

The salesman who merely holds himself in readiness to sell to those who are ready to buy is obviously neglecting an important and profitable branch of retail salesmanship; yet there are thousands of retail sales-people who com-

prehend no other function of salesmanship and recognize the existence of no demand that does not manifest itself in the form of a prompt purchase.

Their conception of the law of supply and demand, as applied to retail merchandise, is that a daily recurring demand for their employer's goods will bring to their departments each day a tolerably constant number of purchasers, much as the tide deposits seaweed on the beach. They do not concern themselves with the origin of this demand, nor do they consider what means they can employ to stimulate it or confine it to the merchandise of their respective shops.

They reflect no more on such matters than the farmer who rakes up and carts away the seaweed reflects on the cause of the tides or meditates on means to induce the waves to cast more seaweed upon his particular strip of shore.

Stomachs to be fed, backs to be clothed, vanity to be appeased, beauty to be adorned, and various other human requirements com-

bine to create and maintain that natural demand for merchandise which is the foundation of trade; but no ambitious retail merchant is satisfied with the natural demand alone.

He not only strives to get what he calls his share of that patronage but also seeks to create new tastes, excite new demands, and promote new requirements on the part of the buying public. He says he wants his share of the business in sight. In reality he wants more than his share, for getting more than one's share is what distinguishes success in retail merchandising as in most other lines of human endeavor.

His window displays are intended to make "window wishers" of the passing throng, and his advertising is meant to bring the public to his store as lookers, if not as buyers. He promotes "charge accounts" with responsible people, is graciously willing to send some kinds of goods "on approval," and adopts the generous policy of "your money back if not satisfied." He baits his hook with every lure that his ingenuity can devise and then he drops the

hook overboard and goes away — far away — way up into his private office. There comes a nibble at the hook. A lackadaisical sales-person pulls up the fish, finds it is nothing but a looker, and scornfully throws it back into the water to swim around until it grows into a buyer. If this fish is permitted to develop into a buyer while disporting itself in the open waters of competition, no one knows what merchant's hook will finally catch it. But if the sales-person who drew the fish out of the water when it was merely a looker had taken the trouble courteously to maneuver it into the backwaters of competition by placing it in the firm's private preserve for prospects properly handled, there would not be so much doubt, and perhaps very little doubt at all, as to whose hook would finally transfix its gills.

The boss wants lookers, because he knows the looker of to-day is the buyer of to-morrow, and he wants to make the lookers feel that his store is "the best place to trade," which is only another way of saying that it is the best place to do one's looking. He also knows that

the looker of to-day can sometimes be converted into a buyer before the day is over. All he requires to accomplish what he desires is salesmanship among his sales-people. Does he get it? Not from all of them. If he did there would be less need for commissions to inquire laboriously into the relation between shopgirls' wages and shopgirls' chastity, for real salesmanship will get the money wherever it is practiced and by whomever it is practiced. Real salesmanship is one light that can't be hidden under a bushel. It's a light that can't be obscured. It's a light that will shine above department heads and floorwalkers and reach clear up to "the old man" in his private office, if you keep it burning long enough.

What is salesmanship? No one quite knows. But if you will take care of the lookers, if you will make all the lookers pleasantly remember what you showed them and how you showed it to them when they were merely looking, you will have mastered one very important branch of retail salesmanship.

JUST LOOKING

The other night on a suburban train I sat behind two women who either misjudged the acoustic properties of the car or were indifferent to the fact that they might be overhead. At least I heard their conversation plainly, without conscious intent to become an eavesdropper. They mentioned the name of a certain New York department store. It is a really wonderful store. Yet these two women in front of me were registering an indignant and heartfelt vow that so long as they might live they would never visit the fur department of this store again. They had been in search of some kind of fur garment. By this time my ears were alert enough, but my sluggish brain and unfamiliarity with the nomenclature of the retail fur trade caused me to miss the exact character of the fur garment. However, I heard them reconstruct in indignant terms the inattentiveness (they called it insolence) of the sales-person who "waited" on them. Evidently they were lookers, but if I am any judge, at least one of them was shortly to become a buyer. The saleswoman, with the intu-

ition of her craft, evidently divined that they had not yet progressed to the buying stage. Handling furs on a warm day in October is rather disheartening work, and I suppose this saleswoman said to herself: "These dames aren't ready to buy. What's the use of showing them goods? Let 'em come back when they're ready." She may have been quite justified. Who am I to say that she wasn't? But I'm pretty sure that her house and she lost a good chance to file a lien on a future fur sale.

Speaking of this store, I myself had an experience of the same sort in the very same store just about a year ago. The advertising man was responsible for it. I was thinking of getting an everyday overcoat — the kind of overcoat that gives you no special concern when you get it wet or fall down on the pavement in stepping off a street car. The advertising man took an eighth of a newspaper page to tell about a certain consignment of London ready-made overcoats. The advertisement had the flavor of Conduit Street — of Conduit

Street at the very least. It made one think of honest British yeomen shearing honest British sheep; of incomparable British weaving and — perhaps — of incredibly stupid British tailoring, if one were not wholly robbed of one's discretion by the infinite charm of the advertisement.

I, as a looker, but a looker with the purchasing point of view not over a fortnight away, accepted the invitation of the advertisement and entered this store to examine these wonderful English overcoats and weigh their qualities of fabric, cut, and finish against the tailored products of the amiable but rather high-charging Fifth Avenue gentleman who makes most of my outer garments. The first coat I tried on developed an unseemly open seam on the shoulder; the next crouched on my back in a most singular fashion. There was something wrong with this and something else wrong with that, but finally there was one that seemed almost, if not quite, all right. I was tempted to say, "I'll take it," but after all, why should I say that when I

really did n't need the coat for a couple of weeks and meanwhile might see something better at the same price or something equal at a lower price? I do not know what lack of sincerity or seriousness I exhibited to the salesman, but I do know that he finally said: "That's a beautiful overcoat and fits you perfectly. *If you really want an overcoat,* you could n't get anything better. Of course, *if you don't want an overcoat,* I can't sell you one." Viewed as a question of salesmanship I thought this rather an interesting situation and asked him to send for the head of the department. "What for?" the salesman inquired. "In order that he may decide whether I really want an overcoat." There ensued apologies and explanations on the salesman's part and assurances of appreciation and esteem for each other on the part of both of us. It was all very charming, but I left without buying an overcoat, and I think it would take something like a requisition on this store from a charitable association to induce me to go there again in quest of an overcoat.

There is but one department of this particular store that I now patronize. In this department they have a certain article at a particularly attractive price. When I need that article I go there and buy it. On such occasions I represent natural demand and an open purse. I measure up to the retail salesman's estimate of what a shopper should be, and I am treated accordingly. I shun all of the other departments. In the past I have visited several of them and usually encountered either indifference to or hostility for lookers. Perhaps no one else has had similar experiences in this store. I do not know about that, but I do know that it is never on the list of accounts presented by the official buyer of my household at the month end. Questioned once as to the reason for this, she replied, "There's no occasion to have an account with them because I never buy anything there except a few things that they handle exclusively, and I might as well pay cash because I never go there without knowing in advance just what I want." Her method of shopping in this

store must be a delight to the sales-people, although probably not quite so satisfying to the proprietors.

The unwillingness of retail salesmen and saleswomen to devote much time to lookers rests on several reasons, but not all sales-people have the same reasons nor is there a universal method of manifesting their intolerance of lookers. Let us consider the case of the gentleman who tried to sell me an overcoat. Except for the fact that he was a bad loser and lacked a convincing line of argument in behalf of his goods, this man was a good salesman. Perhaps you smile and say, "Except for that, he was all right, was he?" You misunderstand me, for I really mean that this salesman had a lot of salesmanlike qualities. Most salesmen can tell a looker at a glance, and he probably knew that I was one as soon as he gave me the "once over." He knew the dice were loaded, but he was willing to play. He knew I was merely a looker, but he was willing to pull out as many overcoats from his stock as I would try on. He had no complaint

to make against the loaded dice until after the last throw. Then, to use the language of the gambling fraternity, he "squealed" or "made a holler." He was a man who believed in his ability as a salesman and he was willing to bet his time and labor that his selling skill could convert me from a looker into a buyer, but when he lost his bet he "squealed." Now his skill was not as great as he imagined and he was not in proper synchronism with the advertising department of his store. To him these London overcoats were just overcoats — nothing else. To the advertising man and to those who had been influenced by his advertisement they were something more than that. The advertising man in an eighth of a page of newspaper space had enveloped them with an alluring British atmosphere, but the salesman was too thoroughly patriotic to say anything about an English-made coat that he would n't say about a Rochester-made garment. When I called attention to a gaping shoulder seam, he remarked, "I can't understand it," in a tone which faintly implied the

suspicion that I had possibly ripped the seam open with a knife when he was n't looking. He threw the ripped coat on a chair and said, "Try this one." When his attention was called to the eccentric needlework in the lining and buttonholes of the next garment, "It's an elegant coat, though," was his only response.

What might he have said? Suppose he had said: "Of course you understand about British tailoring. I dare say you have had clothes made over in London and know that English workmanship even in the most exclusive tailoring establishments is not quite up to American workmanship. That ripped seam is an illustration. It might happen to a garment from any tailor shop in London. We insist on the best workmanship that London can produce and we get it, but, notwithstanding that, we sometimes are obliged to have our own tailors go over an imported English garment, as we shall have them do with that coat there. This is the idea, you know; we stand back of the workmanship, and London stands back

of the material and the smartness of the fashion. There are two great sources of satisfaction in wearing one of these coats. First, you know that the cloth is the finest that any loom can weave. Second, you know that the style has just come oversea from London where the really correct fashions in men's garments originate."

Suppose he had said something like that, would n't it have been better than what he did say? Even if I had gone away without buying, would n't I have gone away with a greater hankering for an English coat and would n't I have said to myself, "If you buy an English overcoat, there's the place to buy it and that young fellow is the chap to buy it from"? Would n't I? What do you think?

And when I started to leave without taking the coat, suppose the salesman had said, "I'll be looking for you back again before the first big football game. I know you'll want one of these coats then." If he had said something like that and handed me his card, would n't he have been a good bit surer of getting my

overcoat money on to his sales-book? What do you think about it?

You may say: "Well, a salesman must make a closing talk, must n't he? A salesman who isn't a closer isn't a salesman. He simply tried to make you fall for the rush act and failed. It might have gone over with the next customer. You can't tell." Yes, that's right. He did simply try to make me "fall for the rush act" — very simply. I don't know of anything that's simpler in a "simp" sense in salesmanship than for a salesman to be impatient, or a bad loser, and give a customer the rush act at the wrong time. A jockey who resorts to the whip and steels before he has reached the final half-furlong of the race is usually condemned by experts on racing technique. To have the mount on a "slow beginner" or occasion "to hook with a front-runner and make her quit" are about the only excuses recognized in racing for the early application of whip and spur. They are also practically the only excuses for using the rush act in salesmanship before your customer is

palpably on the brink of buying. In shoppers the equivalent of a slow beginner is the customer who gives you no indication of his preference in respect to the goods you show him. The proper "rush act" for this kind of customer is to center your selling effort on one of the various styles you have exhibited and say to him in effect, "There's the thing you want — right there," and then tell him why. You can start a slow beginner by giving him the same "work" as you would use in closing an ordinary customer.

A "front-runner" shopper is one who is so voluble and self-centered that you can't get a chance to impress upon her mind the good qualities of the merchandise you are showing her. I say "her" advisedly, for a majority of the front-runner shoppers are females, just as a majority of the front-runners at the race-track are mares and fillies. There are two ways to beat a front-runner at the race-track; either "wait for her to come back," which means wait until she gets tired, or "hook with her and make her quit," which means outrun

her with your own mount in order to discourage her from further running on her own account. In salesmanship the better method is to "wait for her to come back"; but a very good rush act for a front-runner customer, if you feel that you must use the "rush work," is to say in a slightly louder tone and with slightly more rapidity of speech than she herself has been using: "Listen, please! Here is something I think you want. Just forget everything else for an instant. Examine this carefully and tell me if I am not right." The proper rush work in salesmanship is pretty much the same no matter when it is applied, just as the whip and steel always feel pretty much the same to a race-horse. But, nevertheless, it makes a lot of difference when you use the rush work — just as it makes a lot of difference when a jockey uses his whip and spurs. Many a sale has been lost by giving a customer the rush act at the wrong time, just as many a race has been lost by going to the whip at the wrong time. My overcoat salesman apparently understood something about the

rush act, for he confined his remarks to the one particular coat that suited me best. But, because he was a bad loser, he gave me the rush work at the wrong time, and I went away and never intend to go back.

We have taken a long time to talk about this English overcoat and the very English method by which an American salesman tried to sell it to me, but I think the incident is worth the space because this particular salesman was willing to spend more time and thought on a looker than many sales-people are.

A reason why some sales-people haven't any time for lookers is because they think they have other more important work than trying to hold the store's patronage. This applies to small stores to a greater extent than to department stores. In the town where I live there is a drug store which announces to the public that it makes a specialty of catering to commuters' morning-cigar trade. I don't know how they handle that trade now because I have transferred my morning patron-

age. But before I realized that getting to the office at a seasonable hour was more important to me than my patronage appeared to be to the drug store, I made a serious and, I think, fairly intelligent effort to become a regular morning customer of this drug store. Somehow, it nearly always happened that the place was empty of customers when I entered it. The clerks were invariably out of sight. Significant sounds from the stock-room and the prescription laboratory indicated their whereabouts and the fact that they were performing various manual duties preparatory to the day's business. The noise of my entrance and the purposeful shuffling of my feet on the floor rarely brought them forth. A half-dollar pounded vigorously on the top of a show-case would produce results, but not immediate ones. First there would be an interval of silence, while each of the two clerks listened to hear whether the other was coming out of his lair to attend to my wants. Neither hearing the other, both would emerge from their respective places of concealment glowering at

each other and exhibiting toward me the same combination of distraction and impatience that a housewife manifests when she comes to the front door with biscuit dough on her hands and flour in her hair. Each seeing the other apparently prepared to enter upon the hateful task of selling me something, both would start back to the places whence they came. A vehement "Who's going to wait on me?" would cause them to turn around again and stare blankly at me and accusingly at each other. Then, after an exchange of instructions about filling this and emptying that, one of them would detach himself from the really important duties of his position and more or less grudgingly hand out the article which I desired to purchase. I really haven't exaggerated.

That sort of thing happened not only once, but several times. Suppose that I hadn't known exactly what I wanted or had merely desired to look at something that I wasn't quite ready to buy. Do you believe that either of those salesmen could have concealed his sense of disgust and indignity?

Having something more important to do is the reason why a good many salesmen have no time for lookers. It is a curious thing that a clerk who is hired to sell goods and keep the store swept out always dislikes to have a customer interrupt the sweeping of the store; the same of arranging stock or the doing of any of the other manual acts that salesmen may be required to perform. There seems to exist a widespread and singularly distorted sense of proportion which places relatively unimportant manual duties above all else. This is not confined to retail salesmen alone. I know a department head to whom the signing of his mail at five o'clock is more important than the deliberations of an executive conference in which the entire policy of his department is at stake. The letters are a tangible thing and the signing of them represents a definite accomplishment, while a question of policy — well, it's just a question of policy, that's all.

Two other causes that prompt some salespeople to dislike lookers are laziness on the part of the sales-people and rebellion against

their lot. It is next to useless to discuss laziness, either physical or mental, so why should we attempt to do it here? Nor is there any reason why we should try to intervene between an unjust fate and its oppression of a discontented or unambitious sales-person. If a salesman wants to quarrel with his bread and butter, let him do so. It would be like interfering in a family feud for us to attempt to dissuade him.

To retail clerks who are not salesmen, lookers will always be abhorrent. To retail clerks who are salesmen, a looker is an important selling problem and provokes neither impatience, discourtesy, nor a sense of injury. As is true of most problems of retail salesmanship, the best way to prepare yourself to handle lookers is to learn your merchandise so thoroughly that you can always talk interestingly and convincingly about it.

If I were a retail merchant I should encourage my sales-people to encourage looking not only in their own departments, but also in other departments of the store. I

would establish reciprocal relations between various departments. For example, I would ask the salesmen in the woman's shoe department to do a little promotion work for the glove department, and *vice versa*. When a woman shopper has completed her purchases in the shoe department, is there any reason why the salesman should not mention some particularly alluring value or style in the glove department, and if madame shows the slightest sign of interest, is there any reason why the shoe salesman should n't say, "If you have five minutes to spare, I think it's quite worth your while to see those gloves. Here, I'll write it on this slip. If you'll give that to any of the sales-people in the glove department, you'll get prompt service." How would madame feel about it? Regard it as an impertinence? No, not if it was properly done, for a courteous act gracefully done is never counted an impertinence, and would n't this, as a matter of fact, be a most effective way of expressing appreciation of madame's patronage? What would the shoe salesman think about it? If he

knew that the number of the slips turned in at the glove department with his initials on them might have something to do with the "old man's" estimate of his value to the store, I'm sure he'd feel at least a little interest in sending lookers to the glove department and such other departments as were put on his list from time to time.

Yes, sir, if I were a retail merchant or a retail salesman, I'd pay a lot of attention to lookers.

V

BUYING

THE easiest way to define buying is to say that buying is the exact opposite of selling. That's the easiest and most obvious definition, but I think it's a long way from the right one. It would be closer to the truth to say that buying is just a form of selling. Why not? When you buy, are n't you selling your dollars for the other fellow's goods? Are n't you trying to sell your dollars at the highest possible price and to the greatest possible advantage? Perhaps you don't always do it, but, if not, you can comfort yourself with the reflection that for every bad buyer there's a rotten salesman, too.

A buyer ought to be a mighty happy fellow, for he is a salesman whose customers insist on buying from him. He can tell them he does n't want to sell—refuse to sell, in fact. He can be as churlish as he chooses, and within cer-

tain limitations he can be downright insulting. He can be snippier than the snippiest salesgirl ever dared to be. He can act as important and independent as the conductor of a passenger local. Any of you who have ever ridden on one of those solid day-coach, sunlighted "Congressional District Limiteds" that stop for ventilation at every station, know that a conductor on a local is a pretty important and independent person. Yes, sir, a buyer can pull all of that stuff — and more — without driving away the people who want to buy his dollars. He can do it if he wants to, and even if he does n't, it surely must be a great satisfaction to him to know that he could if he would.

Before the days of automobiles, 'way back in those good old days when you used to own a "buggy horse," did you ever rise up in revolt against the exactions of the feed-man and drive out on Sunday — or some other day — to get in touch with the actual producer of equine foodstuffs? In those days, if you lived in the right kind of a town, it's almost a cinch

that one afternoon in the eighties or nineties you took the cushion off the back seat of the surrey, put a couple of the feed-store's sacks under the seat, and started off with old Dobbin to rustle up his supper on the direct-from-producer-to-consumer plan.

How did you come out? Tell the truth. Did n't you almost have to beg to get two bushels of corn, although you could see where the corncrib was propped up with green saplings to keep it from bursting out at the waistline, and you knew the farmer had a mortgage on his farm, and was a whole lot more welcome at the grocery store when he had butter, eggs, or cash than when he said, "Just put that in with the rest I owe you"? And what did you have to pay? It's been a long time now and you don't need to be afraid to tell. Don't tell me what you told the feed-man when he came to your stable for his sacks and found them full of corn — full of corn untainted by the middleman's loathsome touch. What did that corn actually cost? Well, never mind what it cost. I won't press you on that point. But

was n't the old farmer a salesman? You probably called him an old skinflint at that time, but in reality he was just a good salesman — a salesman who held on to his corn the same way that a good buyer hangs on to his dollars.

I don't know much about buying. There are people who do, but they know so much about it that they can't explain it to me so I can explain it to you. My friend Harry Leeming is a buyer. He knows pretty nearly everything there is to know about buying. He is the president or something of the Purchasing Agents' Protective Association, or whatever they call it. I bought him a luncheon the other day, expecting to get at least a thousand words out of him. I got ten thousand, but I can't use many of them. You see I don't give you credit for having any more intelligence than I have, and buying as explained by a buyer is entirely too scientific for me.

What I tell you about buying will mostly have to be ideas that I have doped out all by myself. I'm a pretty poor buyer, so you must n't pay much attention to what I say.

One of my troubles as a buyer is that I'm too sympathetic, imaginative, and susceptible. The one thing that helps my batting average as a buyer is the fact that I am of Scotch descent and have a friendly feeling for a dollar. I like dollars so well that I hate to part company with them. That's a great thing in buying. Love for a dollar helps to make a good buyer.

Out in Denver there is, or used to be, a saloon with a lot of silver dollars embedded in the floor. I think every buyer should have a silver dollar embedded in his desk-top, and before he signs an order (unless his concern is insolvent), he should say to that dollar, "Dear Dollar, I am about to separate our bank account from a lot of dollars just like you. I wonder if the thing I'm going to get is worth the price I'm going to pay?" When a buyer propounds that question to his enshrined dollar and fails to get the oracle to answer, "Go ahead, old chap," I think it would be a mighty good plan for the buyer to say to the salesman, "I'm going to take a little time to think this over."

Firstly, I believe that a buyer must acquire the proper respect and affection for a dollar. Of course, that isn't the only qualification of a buyer, for if it were, all the buyers would be Scots or Jews, which, by the way, a good many of them are. And say, would n't you salesmen rather tackle almost any other kind of buyer than a "Mac" or a "stein"?

Secondly, when a buyer buys, it ought to be something that he knows he needs and is sure he won't have to keep unless he wants to keep it. Maybe the buyer does n't know he needs it nor how easily his house can get rid of it at a profit, until the salesman tells him; but if that is the case, he ought to make sure that the salesman is right. Salesmen are occasionally wrong in their estimates of a buyer's need and the public's demand for the goods the salesmen are trying to sell to the buyer. Of course, no real salesman is a liar, but his enthusiasm sometimes proves to be a potent substitute for falsehood. A buyer should never forget that he is ultimately a salesman. He should remember that he is not only selling

dollars, but is also buying something that must be sold again in some form or other. The thing he buys may be a line of tennis blazers for his haberdashery, or a trainload of wheat flour for his cracker factory. Whatever it is, the buyer must consider its salability. How many tennis blazers will his trade absorb and how will the flour taste when made into crackers. Somebody else has probably decided how many crackers should be sold during the next three months, but it's up to the buyer to decide whether this buyable flour will make salable crackers. A good buy will *sometimes* help to make a good sell, but a poor sell *always* makes a poor buy.

I have already said a good bit about buying without giving any one the slightest idea of how to be a buyer. Frankly, I don't know how, and apparently the fellows who do know can't tell. If all the buyers in the world were brought together in a great big musical *ensemble*, they could, without any rehearsals, tear the roof off with that beautiful old folk-song of the purchasing agents' guild, "I don't know

how I do it, but I do." Encore, "I get by when I buy for the sweet bye and bye." Second encore, "Time cures heartaches and buyers' mistakes." (Notice to K. & E., Messrs. Shubert, and other producing managers; also to all publishers of sheet-music and every person lyrically inclined: All rights are reserved in the above titles. I take this precaution because I have always intended to write the book and lyrics for a musical show that would really interest the "tired business men" of Albany and points west, who clog up Broadway and crowd native New Yorkers into the gutter and away from the bars in Times Square.)

I had planned to divide the subject of buying into several texts and preach a little from each. You can see for yourself that I have gone as far as "secondly." But my "secondly" has n't brought us any closer to the point than my "firstly," so I am going to abandon texts altogether. Notwithstanding the fact that people who know all about buying can't reduce the subject to fundamental

texts, I, knowing so little, had thought I might be able to sum up my knowledge neatly and concisely. But I find that I can't, and I am going to wade right into the subject like a hungry negro into a "battle royal."

Excepting women only, buyers stand at the top of the hunted class. The long-continued oppression of any race of people inevitably produces racial characteristics of craft and guile. Likewise the ages through which women have been pursued by men have produced in them certain instinctive tactics of defense. Let it be said, either to the credit of buyers' intelligence or the ardor of salesmen, that a buyer will ordinarily learn in ten years nearly all that women have learned since the day of Mother Eve about the art of mental self-defense.

In some respects buyers and women employ similar methods. I can think of one illustration of this which may have come within the experience of you salesmen. When a woman, without anger or other marked emotion, asks you a question and looks straight into your

eyes while you answer her, you can ordinarily rest assured that your answer — no matter what it is — will not materially affect her heart-beats. But if she cloaks with their lids or turns away her eyes, meanwhile manifesting absorbed interest in her fan, it's a pretty safe bet that her question has a well-defined purpose and that she awaits your answer with some degree of eagerness and suspense. There is a substantial equivalent for this in the conduct of the average buyer. If a buyer looks searchingly at you and asks a pertinent question, such as the lowest price you can make him, the chances are that he is merely accumulating statistics for his card file. But if he toys with a paper-knife and looks out of the window when he asks his question, the probabilities are that you have succeeded in getting pretty close to the last lap of a sale. It is difficult for me to consider buying from any except the selling standpoint, but if I am to become temporarily a renegade and ensconce myself on the buyer's side of the wicket, I feel duty bound to advise

buyers to go counter to their instincts in this and a good many of the other cute little tricks that buyers instinctively pick up. Remember that the hunter naturally studies the habits and stratagems of his quarry. Quite as naturally, salesmen become familiar with most of the "stalls" that buyers use. A buyer who "stalls" is in greater danger of "tipping his hand" to a salesman than he would be if he did n't stall. As a general proposition it does n't pay a buyer to stall.

No, not at all; the foregoing statement is not inconsistent with my admiration for the methods pursued by the old farmer who sold you those two sacks of corn. The farmer did n't stall. He was sincere. He had planted and ploughed that corn; gambled with spring floods, summer droughts, and autumn frosts; stood off his creditors when they wanted him to sell the corn as soon as it was husked; and skimped through the winter without selling a bushel. When you drove out to his place the new crop did n't look promising and those fellows up in Chicago were starting a bull

movement. There was no telling where "corn would go." That old farmer had been through enough to make him place a proper value on his corn and he was reluctant to part with even two bushels of it. If a buyer knows the value of a dollar and is reluctant to part with his firm's dollars, that ingrained reluctance, frankly and unreservedly expressed, is more effective than almost any stall he can use.

If a buyer has a bad liver or an unreliable digestive equipment, or is a natural-born grouch and can't conceal those facts, I suppose he can't be blamed. But if he is able to conceal them from the president of his company, he ought to conceal them from the salesmen who call on him. I am sure there is nothing to be gained by being nasty with a salesman. If you are a sure-enough buyer and love a dollar well enough, the salesman can't make you buy his goods unless they are something that you really should buy. When you are insolent to a salesman it is more than likely to make the salesman think you are afraid of him — afraid he will be able to sell you some-

thing you don't want. The salesman may very possibly say to himself, "Here's another 'bush-league' buyer." You know what he means. Bush-league ball-players do a lot of umpire baiting to cover up "bonehead" plays, just as a good many buyers bluster at salesmen because they have n't worked out the fine points of the buying game and don't know of anything else to do. I don't think you should let the salesmen get you tabbed for a bush-leaguer. If you do, most of them will hand you their bush-league propositions. A buyer may be buying for a bush-league store, but he wants major-league propositions.

I'll admit that it's a lot of fun to offer to fight a Quaker — almost as much fun as telling a *risqué* story to a clean-minded man. It's also a lot of fun to bulldoze a waiter or profanely send an overdone steak back to the kitchen. It's easy to be what Broadway's initiated call a waiter-fighter, but I don't know whether it pays. A friend of mine, who is a retired waiter, says it does n't. Says he,

"Never cuss a waiter and never send anything back to a cook. If you can't eat what the cook sends you, it's better to refuse to pay for it than to send it back. — Thanks, I'll take a glass of Pilsner. — You see you can't ever tell what a waiter or a cook will do to you if you get 'em sore."

Salesmen are almost as dangerous as waiters and cooks. You never can tell when a salesman will be able to do something to you or what it will be. It is well for a buyer to consider that the salesman's house sees the buyer's house through the salesman's eyes, and that the salesman is frequently the arbiter of many of the disputes that arise between the buyer and the salesman's employers. Furthermore, a buyer does n't always succeed in extracting a large amount of immediate satisfaction from bullying a salesman, for there are some salesmen who make a practice of matching insolence with insolence, on the theory that a bullying buyer is a "bluffer" and needs to have "his bluff called." Is that good salesmanship? We are n't talking about

the selling end of salesmanship, but about the buying end of salesmanship, so I shan't attempt to answer the question. However, as a matter of fact, you never saw a salesman being thrown out of a buyer's office or carried out on a stretcher, did you?

Getting right down to brass tacks, a buyer should n't stall, or pose, or try to gratify his vanity, or indulge his domineering spirit, but he should endeavor to impress the salesman as quickly and as fully as possible with the following idea: "We have dollars to sell for merchandise that will make more dollars. Our dollars are the best dollars and are worth more to you than any other dollars in this town because we are the biggest, or the best, or the most aggressive, or the most intelligent, or the most fashionable," — or whatever it is that makes the buyer's dollars the best dollars. In other words, a buyer ought to try to sell his dollars to the salesman just as the salesman tries to sell his merchandise to the buyer. Anybody can huddle up like a moulting canary and listen dejectedly to a sales-

man's talk, but it takes a real, genuine buyer to sell his firm's dollars to a salesman to the best possible advantage.

An order placed with a salesman at the extreme discount and dating, with every concession included, is frequently not a purchase until the salesman's house says, "We accept." In other words, you may put it over on the salesman without putting it over on the house. The best way to draw forth the last drop of discount, dating, and concession from both the salesman and the salesman's house is to make the salesman believe that your dollars are the best dollars in your town — or territory. A buyer should try to put a salesman in a position where the latter believes and writes the following to his house, "Inclosed find order from So-and-So. You will note that I have gone the limit with these people. The reason I did so is because they are the best people in town," etc., etc. Remember, "they all look good, when they're far away," and if you make it strong enough with the salesman, he will probably be able

to make it strong enough with his house.

Of course, there are concerns which have only one discount. You could hypnotize one of their salesmen and get him to play dead or let you stick pins in him without getting better than the "regular discount." There is "possytively nothing doing" on an "extra five," or anything like that, but at the same time I think that the buyer who convinces one of these salesmen that the buyer's house has the best dollars in town may get a little better service for those dollars, even if he can't get a better price. And certainly the best way for a buyer to make sure that the "regular discount" is the "extreme discount" is to make his firm's dollars look big to the salesman. After all, our first text was n't so bad, for we reach an ultimate conclusion which is very nearly "on all fours" with the first text, because we have to admit that a buyer who loves his dollars well enough can describe them to a salesman in such a way that the salesman will go the limit to get some of them. That is enough for the first text, although I have a

suspicion that we shall work back to it again before we are through.

Now to get back to bullying salesmen: while I don't think a buyer should be a bully, neither do I think a buyer should let a salesman get the bit in his teeth. A first-class salesman works up his selling methods and selling talk with a view to their psychological effect, if you want to call it that. Maybe you're not afraid of psychological effects. I am. Any one should be who will pay a premium to Tyson's for theater tickets, sit next to a bad breath, and get worked up to a point where he sincerely hopes the leading man will win the heart and hand of the star, although he knows that in real life the star is the leading man's grandmother. If dramatists and actors can get me going on that kind of proposition, why can't a good salesman get me going on his proposition? He can — if I am not careful. Mr. Belasco can work up to a dramatic situation that will carry you off your feet if you remain silent and attentive, but he can't create a situation that won't fall flat

if you should shoot out an irreverent question in the midst of it. The same method works pretty well with salesmen.

Some time ago a salesman came to us with a proposition of such proportions and so much out of the ordinary that the people downstairs would n't touch it. They sent it right up to the top floor. The salesman who had this proposition in charge was "some" salesman. We had heard of him and we made an appointment with him in the same spirit as a man who was going to fight a duel would assent to the time, place, and weapons. The day and hour arrived. The salesman had so much to show us that it could n't be spread out on an ordinary desk, so we took him to the directors' room and let him set the stage to suit himself. He got us to sit down and then maneuvered himself into a position where he would have the light on us, just as an experienced duelist should. There were two of us and only one of him, but notwithstanding that, we were pretty evenly matched. This salesman spoke with a soft drawl that was

difficult to identify with any particular locality. My associate said afterwards he thought the man was a Southerner. I was of the opinion that he got his accent along the north shore of the Ohio at some place like Shawneetown, Illinois; but it isn't material whether he was Southerner or Northerner, for he was surely a corking good salesman. He did not speak fluently, although it was probably an effort for him not to do so. He interpolated his arguments with quaint colloquialisms, and after he had driven home a point with impressive emphasis, he would sugar-coat it with an engaging smile and some self-depreciative and ungrammatical remark, such as, "'Course, I may be wrong, but it looks thataway to me. You gentlemen know better than me."

To make a long story short, this man had a perfectly impossible proposition from our standpoint. It would have taken thousands of our dollars and it was n't even a good gamble — at least, I did n't think it was before I went into the directors' room that morning nor after I came out. But when I was in there,

inhaling the opium distilled by this human poppy, the proposition looked pretty good. I felt myself slipping. My associate was already stretched out on a cloud. We came very near spilling the beans. Just one thing saved us. I was on the point of being wafted out of my chair and out of my mind like a thistledown, when I noticed that great beads of perspiration were breaking out on this salesman's forehead. It was a chilly morning and the steam was n't on in the directors' room. In spite of his easy and ingenuous manner this salesman was using the last ounce in him. After all, he was only a salesman — a very good salesman, but a very human and commencing to be a very sweaty one. The spell was broken and we commenced to ask him questions. When he seemed to be approaching a climax in his argument, we interrupted him with a question and made him answer it before he proceeded. At the first question, he looked annoyed, at the second he stammered, and at the fifth he commenced to gather up his papers.

There you have it. Don't let a salesman pull off his sales talk in exactly the way he has it planned; spoil his climaxes just as a piping voice from the gallery sometimes spoils an intense and convincing dramatic situation on the stage. But don't ask obvious questions, because a good salesman is usually ready for them. He generally has a version of his selling talk that will turn any such question to his own advantage. When you ask a salesman a question and he says he's glad you asked it, but nevertheless goes ahead with his regular line of talk without answering the question, don't let him get away with it; stop him and make him answer the question at the point where you asked it.

When a buyer is up against a good salesman, he should break up the salesman's attack at frequent intervals. Interrupting the salesman by asking non-committal questions is one way; another is to check him on any line of talk that does not interest you. If a buyer, like a judge in speaking to a lawyer, will say, "Mr. Salesman, pass on from that

point to any other you care to present," it will ordinarily throw the salesman out of his stride and strip off the artifices of salesmanship. Don't let a salesman feel that he has got you going. You can't prevent him from feeling that way by looking out of the window or yawning. He is familiar with that sort of thing, and if you let him get in all of his talk just as he has it rehearsed, the average salesman has enough confidence in himself to believe that you can't help being impressed. If you want the best a salesman has to give, you must not let him think he has made an impression on you, and the surest way to prevent it is politely to obstruct his efforts to marshal his arguments in the order and manner which experience has taught him to be almost unfailingly effective. Remember, it is n't so much what you think as what the salesman thinks you think that precipitates the bargain which you seek.

Suppose we now try to work around to our second text. A number of years ago, I was in Kansas City and ran out of clean shirts. I

visited the shirt department of a large clothing store. They had a large quantity of shirts in my size, but not a single pattern that I could wear. Honestly, you never saw such a bunch of shirts in your life. Finally, I asked the salesman if he had anything to do with the buying. In heartfelt tones he answered that he had not. Pressed a little further, he explained that the buying was done by a member of the firm. "He's the closest buyer in Kansas City," the salesman proudly asserted; "but he's so busy that after he gets the price where he wants it, he doesn't have much time to pick out the patterns." I'm sure that most of the stickers are bought by buyers who spend so much time getting the price where they want it that they don't have much time or energy left to "pick out the patterns." If a buyer does not keep constantly in mind that he is buying to sell again, and that the ready salability of the article bought is as important as the price paid, he is pretty certain to buy a good many stickers. A buyer should be something more than a skillful swapper of dollars

for yards or pounds or dozens of merchandise. Many a retail store with a good location and a top rating in the credit guides is held back by its buyers. A buyer ought to think of merchandise in terms of style and salability as well as in figures of dollars and cents. If a buyer has n't good taste, if he does n't know the styles of to-day and is n't a pretty accurate guesser of the styles of to-morrow, he is n't a good buyer — provided, of course, that style counts in the things he buys.

It is natural for buyers to place price and delivery above all else. They are important things, of course, but a buyer can make some dreadful mistakes if he becomes too much absorbed in these two points. That this is true of the buyer who purchases goods for a retail store or a jobbing house is so obvious that it requires no discussion here. It is also true of the purchasing agent of a manufacturing concern. I know a buyer who every day visits every sales department and every manufacturing department of the concern for which he buys. With his ear to the ground in every de-

partment he is able to plan his purchases with a full knowledge of what is happening and a pretty fair conception of what is going to happen. He does n't depend on his shop order files alone, and I think he has saved many a dollar by his method. Not every purchasing agent finds time to do this. I know of one who devoted all of his time to studying materials, prices, and deliveries. No one could buy more cheaply and no one could get the material into the factory on a more satisfactory schedule than he. Yet he caused his company to be mulcted to the extent of one hundred thousand dollars in a single damage suit against it. The way of it was this: His company was using a certain material in large quantities; he had maneuvered the price down as low as he could get it. According to his conception of his duties nothing remained for him to do except to get better deliveries. In his characteristic way he went after the manufacturers of the material on the question of delivery, with the result that they greatly increased their manufacturing capacity. It was a fine

piece of work on his part, but unfortunately he had failed to inform himself that the engineers of his own factory were developing a new material which would render useless to his factory the material about which he was so much concerned. Perhaps it was n't entirely his fault, but the fact remains that the damage suit would not have been brought if he had kept a trifle more closely in touch with the other departments of his own company.

No, it is n't easy to be a good buyer, and I don't think any one can tell a man how to be a buyer. Certainly I cannot. Disputing a salesman's statement that he has made you a low quotation, excusing yourself to a salesman who has nothing to interest you, getting rid of a salesman when he is done and does n't know it, are questions of etiquette rather than of buying. You know as much about etiquette as I, and very probably you know a good bit more about buying than I do. There are only a few things about buying that I know. One of them is that if you love a dollar you are cautious in your buying, and cau-

tion is a quality that every good buyer must have. Not long ago a salesman came into a factory to sell some files. He did n't ask for a large order until his files had been thoroughly tried. He merely suggested that the buyer place an order for a "sample lot" of the files. The buyer was willing to do that, but he wanted to know just what the samples were going to cost. A hasty calculation showed that the "sample lot" of files which the salesman wanted him to order would cost over a thousand dollars. He did n't buy. I am informed, however, that several buyers did order "sample lots" of these files. You would n't believe it possible in these days of signed and countersigned buying orders, but I suppose the unwary buyer authorized the purchase of the "sample lot of files" and subordinates filled in and footed the prices. A buyer who really loves a dollar would not buy a "sample lot of files" without knowing their exact cost. True affection for his firm's dollars has checked many a buyer on the brink of a disastrous purchase.

We are back to our first text again, and I think we shall always find that in one form or other the love for a dollar enters into every phase of buying. Even when a buyer forces himself to remember that salability is as important as price, he does so because he thinks too much of his dollars to part with them for goods of doubtful selling quality. Yes, sir, the advice, and about the only advice I can give a buyer, is to learn truly to love his firm's dollars.

VI

GETTING YOUR MONEY

Most of the adventure was squeezed out of the collection business in 1898. I am pretty sure of the date, for my youthful zeal as a collector brought me several croppers before I got accustomed to the Federal Bankruptcy Law. It was in 1898 — I am fairly certain of that.

The Bankruptcy Act works against a collector a good deal as ground rules operate against a batter. It is discouraging to walk up to the plate and bat out a home run and then be anchored at second base by ground rules. It is equally discouraging to travel all night on a local train, snatch a hasty breakfast at a country hotel, rush over to your debtor's house before he has started down to the "store," threaten and cajole him into a security settlement — and then, one hundred and nineteen days later, have to surrender your security to the trustee in bankruptcy

because three kid-gloved creditors, who never missed a single luncheon at their club, got together over a cocktail one day and decided to have your man thrown into bankruptcy.

The Bankruptcy Law is a terribly unjust law if you happen to be the most alert creditor. On the other hand, if you chance to be one of the creditors who were asleep at the switch, the Bankruptcy Act is a beneficent feature of modern commercial law. However, it presents a sort of difficulty now, because this is intended to be an instructive article, and I hesitate to introduce any of those picturesque and semi-lawless achievements that stud the careers of most of the old-time collectors. I am afraid that you would not regard as instructive a discussion of how an insolvent debtor can be choked into giving a collateral pledge or a chattel mortgage. The incident might be interesting but it would not be instructive, since your debtor, when he had recovered his breath and instructed his lawyer to cause your arrest for assault and battery, would probably be advised to go into bank-

ruptcy and have your pledge or mortgage set aside. Lawyers know that the deepest revenge an insolvent debtor can visit upon a diligent creditor is to rob him of the fruits of his diligence by going into bankruptcy.

Nowadays collection diligence in respect of a wholesale account is likely to prove largely unavailing unless a considerable degree of credit diligence has been constantly exercised from the inception of the account throughout each succeeding transaction. The collections of a manufacturer or jobber are for the most part mere incidents in the daily routine of an alert and well-organized credit department. It is only when a cog slips in such a credit department that a wholesale collection detaches itself from its credit mooring and floats out as a derelict, to be salvaged by the collector or adjuster. With retail collections it is quite different. The retail credit man ordinarily has fewer authoritative sources of information about a prospective customer, less time in which to avail himself of them and — most important of all — practically no means of

keeping so intimately informed about a customer's pecuniary affairs that a failing financial condition can be detected before the customer has become notoriously delinquent. In a sense, a retail credit may be said to become a collection the instant it is made. That is the greatest distinction between the two; good wholesale collections depend chiefly on good credits, while in most retail stores good retail credits depend principally on good collections.

This brings us to what I am trying to write about, namely, collections — irrespective of whether they are wholesale credits gone wrong or retail collections that prevent retail credits from going wrong.

Naturally a definite due date is an important factor in collection work. One of the most dangerous things a credit man or merchant can do when he extends credit is to say — or intimate — that the time of payment will be permitted to coincide with the customer's convenience or any other event that is the least uncertain in point of time. In extending credit

to a mechanic, I should much rather have his agreement to pay me a dollar per week for fifty-two weeks than his promise to pay as quickly as he can — even though a literal performance of the latter undertaking would probably result in an earlier settlement of the debt. In opening an account with a Mississippi merchant, I should much rather have his definite promise to pay on December 1 than an agreement to pay as soon as "cotton commences to move," although cotton usually commences to move before December 1. In collection-making, as well as in credit-making, it is important that the time of agreed payment shall always be determinable by the calendar. Next to an absolute refusal to pay at any time, an insolvent debtor's promise to pay when he is "able" and the collector's impotent acceptance of that promise mark about the most hopeless form a collection can assume. I should rather take from an insolvent debtor an unsecured note due on a definite future date than his promise to pay when he is "able," even though neither of us had any

good reason to believe that the note could or would be paid on its due date.

When a note or account becomes past due and has entered the precarious state, a creditor should make up his mind very promptly whether he wants to bring suit or whether he does n't. If he does n't, he should keep the obligation as crisp and fresh as possible. If he takes a note, the creditor, of course, wants security, but a future-due note without security is better than a past-due obligation on which the creditor is unwilling to sue.

I do not have in mind alone the acknowledgment of a debt that ordinarily results from the giving of a note. Greater than that are the benefits to a creditor that frequently follow the execution of a promissory note or other negotiable instrument by a delinquent debtor. Although scarcely a typical illustration of what I have in mind, I am moved to relate the very remarkable result that was once produced by a St. Paul tailor's determination to change the status of a certain delinquent account. The debtor in question was

a sort of promoter who had become indebted for a suit of clothing. The repeated presentation of the account by the tailor had brought no payments of any sort. Finally he decided, as distracted creditors frequently do, that "something must be done." He so informed the promoter and concluded this emphatic declaration with the heartfelt question, "Can't you do anything?" The promoter was not impressed. In fact, he was rather amused, and, to show both his amusement and unconcern, replied, "I might give you a sight draft on the Czar of Russia." The tailor, through a politic desire to show his appreciation of his debtor's humor or else because he was too much discouraged and exasperated to care what he said, replied that he would accept a draft on the Czar rather than let the account remain in its present condition. The promoter, although he had no claims upon nor credit or acquaintance with the Czar, proceeded to prepare a draft upon the "Little Father." The tailor, feeling perhaps that the debtor's fantastic act constituted at least an

acknowledgment of the debt, took the draft and went on his way. A series of circumstances not necessary to relate here resulted in the draft being deposited in the tailor's bank, whence in due course it arrived in Russia. The promoter had entirely forgotten the incident, when a couple of months later he received a communication from a bureau head at St. Petersburg, containing the information that while his draft had in that instance been paid, he must in the future refrain from making drafts upon the Czar personally, and must instead make requisition on the writer of the letter, such requisition to be accompanied by a full explanation of the services covered. This story is vouched for by a prominent and, I believe, truthful member of the Minnesota Bar, who had an intimate acquaintance with the drawer of the draft.

Perhaps it does n't much matter whether the story is true. If it is true, it does n't prove anything, unless we want to accept the theory that Providence is on the side of the creditor who refuses to let his accounts grow stale.

However, I believe that one of the most important things in the collection business is to get your debtor to "do something" — for, if nothing else can be done, it is important to keep him alive to the moral obligation that rests upon him. This phrase, "do something," appears quite frequently in dunning letters, and is often used by collectors in their oral interviews with debtors. It is a good underlying motive for a collector to have, but it should not be defined in such general terms. The something a collector wants a debtor to do should be definitely in the collector's mind and approached with all of the adroitness at the collector's command.

A creditor always knows what he most desires a debtor to do. He wants the debtor to pay in full. If he can't have his first wish, he should know definitely what his second wish is and work definitely toward its accomplishment. A substantial part payment is usually the creditor's second choice. Then comes security for the entire debt. And finally, if nothing better can be obtained, and the credi-

tor does not care to invoke the aid of the courts, an unsecured note is probably the creditor's best remaining alternative — and last, but not entirely to be despised, just a plain, ordinary, honest-to-goodness promise to pay on a certain date.

A plain appeal for a plain but definite promise occasionally has gratifying results. I remember that one December, about ten years ago, I decided to send a New Year's greeting to a lot of debtors whose indebtedness we intended to wipe off the books as uncollectible at the then fast approaching close of our fiscal year. The letter which we sent was pronounced by my superior officer, "About the silliest thing I ever saw." It started out with a more or less poetic reference to the dawn of the new year. We proceeded on the assumption that delinquent debtors are particularly conscious of their indebtedness on January 1, although I do not believe they are, nor that the emphasis laid on this point had anything to do with the success of our letter, except as it afforded a slightly different and

decidedly less peremptory introduction than is found in most dunning letters. The important money-getting paragraph in this letter proved to be the following: —

"From what we believe to be true of you as a man, the fact that you have not paid us can mean but one thing, namely, that circumstances over which you have had no control have prevented you from paying. It would be an impertinence for us to inquire into those circumstances. They are a part of your own private affairs. All that we ask of you now is that you tell us when you will pay. If you name a date when you will pay, we know you will do it. Your statement of the exact date upon which we may expect payment will be helpful to us because we have the same problems of raising money that you have. We are a large concern, to be sure, but for the same reason that a farmer keeps no more horses in his stable than he needs to plough his corn, we keep no more money in our business than we actually need. Therefore when you write us when you will pay, a little cash

will also be appreciated if you can spare it now, etc."

You can't blame the man who called this a silly letter, yet it brought several hundred dollars in cash and promises that ultimately netted several thousand dollars. One of the latter was from a gentleman who had been discharged in bankruptcy. He said: "I guess you don't know I'm an adjudicated bankrupt and don't owe you a cent under the law. If you did, you would n't write me that way. I don't have to pay you, but I will on May 1." He did. Another gentleman from the "Blue Grass," who had impoverished himself through his fondness for race-horses, wrote: "I've never welshed yet. I'll send you the money by July 1." He sent part of it then and the rest later. Yes, sir, I'm a great believer in a promise that names a definite date of payment, no matter who gives the promise.

If I could announce a method that would unfailingly extract cash or security from debtors, — good, bad, or indifferent, — this

would be a very valuable article. In fact, if I had any such method, I doubt if I should be generous enough to disclose it here. But I can give you some of my theories about the technique of collection-making. You must take them for what they seem to you to be worth. The most that I can say in support of them is that I have practiced these theories with some success.

When a collector tackles a delinquent debtor — either by correspondence or in person — I believe he should proceed on the theory that he has something to sell to the debtor. If you have read the preceding chapters you already know that I regard *buying* as the *selling* of dollars. I am equally convinced that *collecting*, when truly defined, is simply another form of *salesmanship*.

What is it a collector can sell to a delinquent debtor? Perhaps the answer depends to some extent on the kind of debtor. I don't mean by this the debtor's character or temperament. I have encountered a good many different debtors and I have n't the faintest concep-

tion of the characters of any of them — not even the worst deadbeat among them. When I say the answer depends on the kind of debtor, I mean that it depends on some such thing, for example, as this: whether the debtor is execution- and garnishment-proof; or is a solvent farmer who has stood off the grocers and implement dealers through so many crop failures that he has become habitually slow in paying his debts; or is a person who imagines himself so rich and powerful that a tradesman's unpaid bill has no significance except that the debtor has n't time to check the bill and sign a check. Those are a few of the several types with which a collector may have to deal.

Let us consider the execution- and garnishment-proof man. "Bullet-proof" and "bomb-proof" are phrases that are frequently applied to him. What can the collector sell to such a debtor? There are several things, but all of them are specialties, and the collector has to work up their sale as carefully as the specialty salesman develops a purchaser's interest in

his goods. Some of the things that can be sold to a bullet-proof debtor in exchange for his reluctant dollars are self-respect and vanity. I have encountered a good many debtors who were not commonly regarded as possessing much self-respect, but in most cases it proved that some semblance of self-respect could be aroused within them. A collector has the considerable advantage over a salesman that he need not be entirely sincere, while a salesman should be entirely so. If a collector's approach to a debtor is marked by a distinctly cordial and friendly manner, the debtor is usually disposed to accept the collector's deportment as truly indicative of his state of mind. On the other hand, a buyer is inclined to suspect that excessive courtesy, or more than ordinary geniality, on the part of a salesman is assumed for the occasion, and he is more likely to be annoyed than impressed favorably.

Personally, I am a great believer in giving a debtor a hearty handshake when I introduce myself to him. If a male and not one whose age or station would make such a familiarity

in bad taste, I like to use the old-time exhorter's method and put my left hand on the debtor's right forearm when I shake hands with him. I have had that sort of thing done to me, and I positively loathe it, but with the average debtor it seems to be one of the most conciliatory and confidence-inspiring things a collector can do.

It is a mistake for a collector to hem and haw about his mission. When he is shaking hands is the time to declare it. If he does n't, the handshaking is n't much good. When I was actively engaged in collection work, my favorite — and most successful — opening speech was this: "I'm Maxwell of the So-and-So Company. I've got that little account of yours with me. Guess you overlooked it — or something. Anyway, I guess you don't generally let an account get in the past-due file this way."

That does n't sound like much, but it represents some experience and a good deal of study on my part. First of all, it is man-to-man talk without any frills — and, by the

way, "reckon" should replace "guess" when one gets south of the Ohio River. In the second place, this greeting contains no implication of reproach or lack of confidence, but does imply that you have a good opinion of the debtor which you confidently expect he will fully justify. In the third place, this kind of approach puts it up to the debtor to explain everything to you. In my days as a collector, no debtor whom I had approached in this manner ever came back immediately with a flat refusal to pay; this despite the fact that I have worked on a good many collections where breach of warranty was claimed or some other disclaimer of indebtedness was made.

In my judgment it is important that a collector should encourage a debtor to talk, and that the debtor should divulge his entire list of excuses — or grievances — before the collector commences to do his talking. A good collector is always genuinely sympathetic when a hard-luck story is told. He can be that without being any less resolute in his deter-

mination to get an immediate cash settlement. Likewise, if the debtor disclaims indebtedness, the collector should be capable of listening patiently and attentively to the debtor's attempted justification.

I remember that a good many years ago I was in a little town in southern Illinois, collecting for a harvester company. For several days I had been driving out among the farmers. Finally I cleaned up the county except for one dilapidated old note which had reposed for several years in the collection files of the local attorney. One rainy Saturday afternoon I asked for the note. The lawyer laughed at me. "Nobody can collect that note. I've tried it, and three or four collectors before you have tried. As a matter of fact, the fellow does n't owe it. You people took the binder away from him over in Indiana without due process of law, sold it for $12, and now you're trying to collect the balance. This fellow is a jackleg carpenter around town here. He just makes enough to live on, and he could n't pay if he wanted to — which you

can rest assured he does n't want to do. Furthermore his wife is a virago and is liable to throw boiling water on you if you go down there."

While this was not an alluring collection, it was in the line of duty. I found the man in his henhouse, where he was repairing the roosts. He was not anxious to talk about his indebtedness, but appeared quite ready to quit work. The silencing of his hammer strokes soon brought his wife upon the scene. She proved to be all the lawyer had said about her. She called my company and me all of the names that a chaste woman could well include within the limits of her vocabulary. I am not certain that she did not exceed such limitations. With hat in hand I listened fearfully but, fortunately, with a most respectful manner. At the conclusion of her tirade, withdrawing a threatening and formidable fist from the near proximity of my nose, she remarked with a sigh of relief: "You are the only one who would listen to me until I got through. Now you know what I think of you.

We've got eighty dollars in the house. If you want that, you can have it, just because you're the first one that's ever come around here and treated us like we was white folks." Thus, practically without saying a word, I made a comparatively good-sized collection on a tolerably worthless claim — so worthless, in fact, that the local lawyer disbelieved my assertion that I had collected eighty dollars on it, and neglected to claim his commission.

When a debtor has had his say is time enough for the collector to start in. A pretty good way for a collector to commence when he has heard the debtor's story is to say: "I knew there was something like that or you would n't have let this thing run the way it has." This satisfies the debtor that his statements have been taken at their face value. He has had his say and relieved his mind. He is hardly in a position to turn an unheeding ear to the collector's remarks.

Suppose a debtor claims he does n't owe the debt. After the collector has heard the debtor's statement, it is up to him to say in effect:

"I know exactly how you feel about this. You want to be fair and square, and so do we. The trouble with both of us is that neither of us can look at this proposition the way a third party would, and the trouble with third parties is that when you get twelve of them in the jury box and another up on the judge's bench, it costs both sides a lot of money to find out what disinterested third parties are going to think after all of the facts and law are brought out by a gang of high-priced lawyers. Then, if the fellow who loses the suit is dissatisfied and wants the higher courts to pass on the case, there is a lot more expense, not counting the time and worry and bother. You can get plenty of good lawyers who will advise you that you can beat us in a suit. We can probably get just as many who will advise us that we can beat you. They will all be honest about it, too, but in the wind-up you and my house will have some good big bills to pay, no matter which way the case goes. If there was n't anything involved but dollars and cents, my house would a good deal rather com-

promise with you than bring a suit. They know there's no money in lawsuits. So do you and so do I; but here's the point: My house can't afford to lie down on a proposition like this. If they did, it would be talked about all over the country in no time, and, as you can readily appreciate, it is better for them to carry a case to the Supreme Court — even if they finally lose it — than for them to lie down. You know what I mean. Now, what do you say to this: Before either of us starts in to buy law, suppose you and I try to forget that we are interested in this case, and see if we can't look at it just as if we were a couple of jurymen. We won't argue with each other, but we'll take up each point and discuss it from both sides, and try to make up our minds how a jury or the Supreme Court would look at the case. What do you say?"

With variations I have used this line of argument in the attempted adjustment of a good many disputed claims. I have n't always succeeded in getting the desired adjustment, but I have never failed to get a disputatious

debtor to open his mind to an unheated and fairly intelligent consideration of my side of the case. What is it that the collector sells to the debtor in this instance? Partly self-respect, partly vanity, and partly something else. Self-respect, because no self-respecting debtor can preserve his dignity and decline a courteous and tactful challenge to put his cards on the table. Vanity, because you give him credit for being a fair-minded man and ascribe to him all of the knowledge of the courts and litigation that you yourself possess. To justify your opinion of him he is virtually obliged to join you in your proposed judicial consideration of the disputed debt. As to the other things you try to sell him, one is the conviction that he is in for a lawsuit if an amicable settlement cannot be effected. You don't threaten a suit; you merely treat it as an inevitable, regrettable, and unprofitable necessity unless you and he can avert it by making a friendly adjustment. Few men enjoy lawsuits, and if you deprive the average man of all excuse for a heated discussion of his

case or emphatic prophecy as to its result, his enthusiasm for litigation is likely to depart as rapidly as the joyousness of a belated reveler when overtaken by a chill November dawn.

Now let us come back to the man who alleges no defense, but has a great many excuses — the hard-luck man. You tell him you know he wants to pay and intends to pay. You did n't understand why he had n't paid until he told you why. Now you know; his excuses are perfectly good; no apologies are necessary; you will explain it to the house so they will understand it as well as you do. Everything is all right up to date, but now a time has come when the house is asking for money and is depending on you to get it for them. What excuse can you offer for not collecting this account? None whatever. If you can't collect this account, you've got to admit that you're a mighty poor collector. Here's an account that is absolutely good. Anybody would be glad to have it in their books. How can you go back to your house and admit that you couldn 't collect it? That the man has n't

got the money won't go as an excuse — not unless he is the kind of man who does n't stand well enough among moneyed people to raise a few dollars when he runs a little short. "Listen, Mr. Debtor, you know there is no excuse I can give them for not collecting from you."

It is probably unnecessary to continue this hypothetical conversation. It is enough if I have made clear what I mean when I express the opinion that a collector should try to sell self-respect and vanity to a debtor.

Once I had a traveling collector down South who could n't collect from negroes. I had written him how to do it. Finally he wrote me, "Maybe you can, but I can't." That "maybe" got under my skin, and I got on the train. When I joined out with him, as they say in the circus business, he had a case ready for me. It was a debt against a black man, named Sam Jackson, described by local authorities as "the most no-'count nigger in this State. He married a yellow gal that used to work for the Carters. They got a little place

worth about eight hundred dollars, but she won't sign a mortgage."

We went out to see Sam and found him working for wages — far below the wage exemption. "Yessuh, I'd pay if I could, but I just naturally kaint. Security? How I gwine give security? My wife? Yessuh, I'm just the kind of a man you-all gemmen says I is. Yessuh, I aims to pay, and if you kin git Lucella to sign a mortgage, I'se perfectly willin', yessuh."

We returned to town and hired a handsome surrey and two handsome gray horses. We did not take a negro driver. Alone we drove to see Lucella. Flattered she undoubtedly was, although scarcely enthusiastic about giving a mortgage on their little farm. The pleasurable experience of driving back to town on the rear seat of a surrey with two "white gemmen" in the front seat finally overcame her reluctance to come face to face with the mortgage question. We picked up her husband and started back to the courthouse, meanwhile asserting and reasserting our con-

viction that within her heart dwelt that fine sense of the obligation of a debt which distinguishes the high-class colored person from the ordinary negro. Unhappily, however, our ignorance of local geography permitted us to drive past the Carter mansion, and Lucella insisted upon alighting and consulting Miss Hallie. With heavy hearts we continued with Sam. We prepared the mortgage and awaited Lucella's arrival. At length she came, distinctly defiant. "Miss Hallie says I ain't got no call to sign no mortgage."

"Dats allus the way with a woman," Sam sagely remarked.

He thereby gave us our cue. "Lucella, have you less pride than Sam? You've been raised as well as he has, have n't you?"

I placed a pen in her unwilling hands.

"No, suh, I just ain't going —"

"I knew you would, *Mrs. Jackson.* You sign right on that line there."

She signed, and the court official cynically took her acknowledgment of her act and subsequently remarked, "I'm mighty glad some-

body can make those two niggers do something."

Instead of inspiring my collector, I caused him to resign, for he said that he would never call a negro woman "Mrs." Personally I don't think it was the "Mrs." alone that induced Lucella to sign the mortgage, although the use of that word no doubt had a part in the final result. I tell the story because I think it illustrates how vanity can be sold to a debtor. Perhaps it will interest you to know that we permitted Sam to pay the debt as he found it convenient and that Lucella probably still lives in the same little mud-chinked log cabin.

Farmers frequently present a great collection problem; not because farmers don't pay their debts, but because they don't always pay as promptly as manufacturers and jobbers expect a country merchant to pay for the goods he has sold to the farmers. If I were a country merchant, had a lot of good but slow farmers on my books, and needed money to pay the jobbers and manufacturers with whom I dealt, I should state the case to my farmer cus-

tomers very frankly. As a starter I think I should tell them or write them something like this: —

"The manufacturers and jobbers from whom I buy goods like to have me pay them promptly, and I generally manage to do so. You know that I handle first-class goods and that I try to keep my selling prices as low as possible. The values and the service that the merchants in this town can give to their customers depend to some extent on their standing with their jobbers and factories. Prompt pay is the best standing a merchant can have, and that is the standing I try to maintain.

"You are my customer. I value your patronage. I want to keep it, and I know that I can keep it as long as I give you the right goods and the right service at the right prices. I have written this letter because I am sending you a statement of your account. I want you to understand, however, that this is not a dunning letter. On the other hand, if you feel like helping me out, I can assure you that the money will come in handy."

I know a good many farmers and I know a good deal about them. They are pretty good fellows, and while they frequently seem a trifle indifferent in regard to their notes and accounts payable, I have never known them to refuse to help a neighbor when he needed help, nor have I ever known them to refuse to help a good merchant when he needed help — provided he asked for it in the right way.

If I had a lot of fashionable millionaire delinquents, as many city merchants do, I should handle the collection of their accounts a good deal as if they were farmers. In both cases I should try to sell the sense of gratification that any one, whether farmer or millionaire, is likely to feel in bestowing a favor and at the same time discharging a debt that in any case would have to be paid some time.

Collection-making is probably the most human phase of business and the simplest and the easiest. Deadbeats there are and always will be, but it is surprising how many deadbeats will pay if their indebtedness can be presented to them in the right light. I know a

man who rarely pays a legitimate bill, but is scrupulously prompt in paying bets. It should be possible to raise some of his legitimate obligations to the dignity and importance in his eyes of one of his gambling debts. The trouble is, however, that ordinary collection methods do not suffice in his case. The usual progression from the perfunctory mailing and presentation of an account to the ultimate threatening demand for its payment embraces no collection method that has the slightest effect upon him. Yet I believe he would not be a difficult man to collect from if properly handled.

The collector should assume, or at least pretend to assume, that every debtor wants to pay and intends to pay. The debtor's past delinquencies should not be held against him; he should rarely be reproached with them, for, however satisfying this may be to the collector, it gives the debtor a chance to say, "If I have the name, I might as well have the game."

When a cash settlement can't be obtained, a secured note is usually the next best thing. It

has been my experience that the easiest way to get security is to press for cash long after you have given up all hope of getting it, and then, as a possible alternative and in the guise of a concession to the debtor, bring up the question of security. Here again vanity can sometimes be sold, for the ability to get a solvent surety to sign one's note is a sort of proof of one's financial standing. Failing either cash or security, a definite calendar date promise of payment, partial or entire, is the least a collector should content himself with, for one of the most important things in the collection business is to keep a debtor doing something even if it is no more than promising.

VII

CREDIT-MAKING

"How droll!" the young matron remarked as she finished reading a printed form letter which her husband handed her one evening.

The form letter had been addressed to the husband at his place of business and ran as follows:

With reference to your application for credit with us, let us say that we have availed ourselves of your references and will accommodate you with credit up to $100 [the amount inserted in typewriting] in conformity with our usual terms, which are, that a statement will be rendered on the first of each month for all purchases of the previous month and settlement must be made before the tenth of the month following the month in which the purchases were made.

Trusting that this will be satisfactory, we are,

Yours truly.

The young matron explained: "You see it was like this. I had intended to have Measure and Cuttem make my spring suit, but I happened to be in Readymade's suit department the other day and they had a blue serge that nearly fitted me. I had no money in my purse and the saleswoman urged me to open an account with the store. I did n't suppose they thought they were 'accommodating' me or that they were going to write you about it. I thought I was 'accommodating' them by opening an account."

Credit departments of retail stores are not always quite so undiplomatic or ungracious, nor are young matrons always quite so ignorant of the functions and methods of a credit man, but credit-making is droll — very droll — just as the young woman said, and the average shopper has but a very vague idea of what a credit man is supposed to do.

Credit men can be divided into two principal classes: gamblers and grouches. Outside of these two general classifications are quite a number of other credit men, to be sure, but

it would take a long time to classify all of them, for nearly every one of them deserves a classification all by himself — such are the subtitles of credit-making when one decides to be neither a gambler nor a grouch credit man.

Gambling credit men are common. To be one is as simple as to be the *croupier* at a gaming-table. There is nearly always a percentage in favor of the house, whether it be gaming-house or merchandising establishment. The gambling credit man has his own estimate of the percentage against the buyer and makes his credits accordingly. Playing on a wide margin of profit and supported by a corps of efficient collectors, he will last a long time; I know some who have lasted for years and kick in under the table at every Credit Men's Association banquet and look as wise as anybody, while a Congressman from out West, who was formerly a notary public and attorney-at-law at Broken Bow or Wounded Knee, holds forth on the iniquity of Wall Street and the true inwardness of credits — the former represent-

ing a bucket-shop trade that went wrong and the latter a flier in second mortgages on western Kansas farm lands just before the last panic.

A gambling credit man, whether wholesale or retail, if true to type, is always ready to take a chance, but he does n't like to play with marked cards unless marked by himself. His investigations about a prospective customer call for about the same information that a prudent card-player would like to have about his opponents in a Pullman car poker game. An even break is all that a gambling credit man wants — an even break plus the percentage of profit that his house has included in the selling price. If an applicant for credit is a notorious deadbeat, the gambling credit man wants to know it, just as a poker-player would like to know whether his opponents are professional card sharps — but outside of that, almost anything goes.

The gambling credit man acquires a sort of sixth sense that is not so very different from the intuition of the gambler, commonly called

"wiseness." He turns down a credit risk occasionally for no better defined reason than sometimes prompts a gambler to "lay off" a poker game when both habit and inclination urge participation.

I don't know of any particular reason why we should talk very much about gambling credit men. If you are a deadbeat, there is always a chance that you can put one over on that kind of credit man. On the other hand, there is always the chance that he'll stab you with his little old C.O.D. stamp. You never can tell. And, oh, before I forget, let me warn you, dear Deadbeat, that a free-and-easy, take-a-chance credit man is usually a mighty tight collector. Usually he will take as many chances getting his money from you as he did in giving credit to you. Sometimes his confidence in his collection methods is what makes him so free and easy in his credit methods. Therefore, Mr. Deadbeat, unless you are bulletproof and shame-proof, be wary of the gambling credit man.

So much for the gambling credit manager.

Now about the grouch credit man — "grooly grouch" as the little boys and girls say. He can be one of two kinds. There are more than two kinds, but there are particularly two kinds. First, there is the frock-coated, white-waistcoated, clammy-handed credit man who has several building and loan books and a good pew at church, and at one time wrapped bundles in the "retail" or picked orders in the "wholesale." He'd rather save his company — "my employers" — a dollar than make them ten dollars. He is the sort of man who will stand in the cloak room at a credit men's dinner and tell the collection manager of an installment diamond house that *his* credit losses during the preceding year were only one nineteenth of one per cent. That's one kind of a grouch credit man. Really he is n't a grouch at all. He's never spent much money himself, — probably does n't even have a charge account at his own store, — and is naturally suspicious of any one who wants to buy anything on credit, but he's a pretty decent old fellow, at that. You know that kind

of man is always old, no matter what his age in years and months and days may be. He's old, that's all, but he's a pretty good chap and the world would be better if about ninety per cent of all of us were like him. He hates to make a credit, and, if he dared to express his own convictions, would probably advise everybody to pay cash for everything. However, he's the easiest collector in the world when sickness and misfortune overtake his debtors; but Mr. Deadbeat, your interest in him is purely academic, for such as you rarely put anything over on that sort of credit man.

The other kind of grouch credit man? He is a burly chap — burly of mind if not of build. Privately he may be a charming sort of fellow. Usually he is, for almost every man is charming when you really get to know him; nature has few moulds from which something worth while cannot be fashioned. The burly credit man does n't usually know very much about credits, but that is n't exactly a distinguishing mark, for scarcely any one knows much about credits. He likes to say to a sup-

plicating salesman or sales manager in a very gruff voice, "Nothing doing — absolutely nothing doing." There is a pleasure to him in saying that gruffly. The gruff part is particularly pleasurable. He is nearly always in the employ of a manufacturer or jobber, for his kind does n't thrive in the atmosphere of a retail store. This kind of credit man is usually the kind that can be placated, and therein lies his greatest weakness. He is particularly susceptible to acquaintance, for no one can be a grouch with everybody — the line has to be drawn somewhere. When he gets acquainted with a customer, he is inclined to extend credit on the strength of his acquaintance, and unfortunately his acquaintances are more likely to develop along social than financial lines. At creditors' meetings this kind of credit man is frequently to be seen chewing bitterly on the end of a cigar and confiding to all who will listen, "I can't understand it. I've known John for years — known him intimately. I can't understand it — no, sir, I can't understand it."

Acquaintance is a quicksand of credit. Real acquaintance would be an aid, but the kind of acquaintance with our customers that most of us acquire, when the customers visit New York or Boston or Chicago, or wherever it may be, is n't exactly the sort of acquaintance that helps us in making credits. We may become acquainted with the fact that a customer prefers thick soup to clear, filet mignon to fowl, and Eva Tanguay to Maude Adams, without really finding out very much about him. When we commence to count him our friend, we are more apt to inquire whether the September Morn cocktail and the Hesitation Waltz have struck his town yet than to try to check up his accounts and bills payable and receivable, stock on hand and cash in bank against his annual turnover, and compare the result with ditto of last year.

Being a "chilly proposition" or a grouch does n't help a credit man very much in the long run, for there is no ice so cold that it can't be melted and no grouch so deep that it can't be penetrated. Fear, however, is another

matter—quite. The credit man who is afraid of losing his employer's dollars, and grows irritable over it, acquires a grouch sometimes that is mighty hard to dissipate. That kind of grouch credit man will ordinarily watch a risky credit more consistently and constantly than the burly, bellowing kind of credit man. An ex-burglar acquaintance of mine says, "A bulldog is the biggest sucker in the world if you know how to handle him, but look out for them cowardly collies." There are bulldog credit men and collie credit men. Of the two, the latter are probably the more likely to nose out a customer's failing financial condition in time to prevent a loss, but neither is exactly the ideal type of credit-maker.

We have now considered three common kinds of credit men. Of course, no credit man is consciously anything like any of these three kinds and you could n't expect him to admit that he is; but who of us are able to see ourselves as others see us? Surely not I. Which brings me to my own personal ideas of credit-making. I have some of the best ideas about

credits, but at the same time am one of the worst credit men you ever saw. Just a moment ago I was comparing two bank statements. You know what I mean: those neatly printed statements of assets and liabilities that tell you everything — and nothing. By my rules of financial analysis one of these banks, according to its statement, figures about ten per cent stronger than the other, but my conviction is that the bank which figures the weaker of the two is in reality the stronger. Why? Chiefly because it is the older and larger and has a widespread reputation for stability. Although it has a greater proportion of wild-cat assets and has gone to greater lengths to boost the size of its surplus, I am willing to fall in line with the mob and say, "That's the bank for me."

This typifies a difficulty that so-called scientific credit men frequently experience. If you are a scientific credit man, your system may figure out one result while your natural inclination is to do the exact opposite, because every one else seems to be doing it.

Herein is a double-barreled credit truth. One barrel shoots forth this practical fact: the individual or business house that is old enough or big enough or throws a sufficient bluff to obtain a popular acclaim of credit worthiness, is not only likely to get a lot of credit, but is also almost sure to get a lot of assistance in troublous financial times. From the practical credit man's standpoint it is fairly safe "to string along with the bunch," for if the "bunch" happen to be wrong, they are going to be mighty slow to admit it and will ordinarily do almost anything to prevent the object of their misplaced confidence from blowing up and disclosing the full extent of their indiscretion. When the entire "bunch" is fooled, you seldom hear of a quick "blow off." There are sure to be a lot of creditors' meetings, reorganization plans, retrenchment schemes, and that sort of thing before any legal notices are pasted on the front door. And, ordinarily, the "bunch" are able to pull a popular debtor through.

The other barrel of this credit truth con-

tains a charge — or suggestion — to credit-seekers. If, in a majority of cases, the credit-giver, for the reasons aforesaid, feels a certain security in extending credit to the credit-seeker, who has already received credit in consequential amounts from a considerable number of other credit-givers, then, surely, considering future possibilities of financial stress, — as well as present facility in obtaining credit, — it profits the credit-seeker to establish an extended line of credit with several credit men in order that each may influence the others in the continuance of credit favors, and all combine to save the credit-seeker — and themselves — should financial difficulties threaten. Have I made myself clear? I hope not, for what I have said in this paragraph is solely to appease a sense of duty. In writing about credits, one should at least pretend to consider both the giver and the receiver of credit, but I am reluctant to offer any suggestions to the seeker of credit, for he — on the average — already has decidedly more effective and successful methods than the credit-giver.

Yes, there is a science of credit-making and it is practiced — up to a certain point — by a good many credit men. There are several books that teach the rudiments of this science. There are rules for estimating the liquidating value of various kinds of merchandise and accounts and bills receivable. There are rules for determining the proper ratio of debts owing by the credit risk to debts owing to him — and their proper relation to his stock on hand and cash in bank; then there are rules for determining the proper relation to all of this of his annual business — annual turnover is the neatest way to put it. These rules are good. They can't help being good, because they are mostly founded on statistics. Everybody knows that anything founded on statistics is good.

The only trouble with these scientific rules of credit-making is that when you commence to apply them you find that, outside of the Standard Oil Company and one or two of the larger railway systems, no corporation is really entitled to credit, and as for partner-

ships and individuals — well, I'd rather not say, for fear of hurting some one's feelings.

There you are. If you are consistently a scientific credit man, you can extend credit to scarcely any one; and when you abandon scientific methods there is an excuse for extending credit to almost every one.

As practiced, credit-making is n't much of a science. The science of the credit men who imagine they are scientific consists mostly in a collection of hobbies, prejudices, and superstitions. Some of my own, for example: In dealing with individuals, I am afraid of men with lobeless ears; of certain classes of professional men; of all owners of threshing-machines, sawmills, or race-horses; of all takers of tips; and of nearly all persons who speak with extreme emphasis — or naïveté — or unction. Absurd, you say? I know it. And since my prejudices against individuals in a credit sense are admittedly absurd, I shall not attempt to state my pet antipathies in respect of corporations and partnerships.

The scientific credit man may preserve a

few of his hobbies and theories and apply them now and then, but mostly he "strings along with the bunch" — and does what the bunch does when any of his credit risks come financial croppers. There can't be any real science of credit-making any more than there can be any real science of love-making. Credit is a personal thing. So is love. But success in either love-making or credit-making usually turns on extraneous circumstances. For example, the successful Romeo of a New England village might become a wall-flower in a Western mining-camp, just because of the difference in supply and demand. So it is with credit men. If your house is selling goods that every one must have, it is one thing to be credit man, while it is quite another if the goods that your house makes or sells have to be crammed down the throats of possible buyers before sales can be effected.

After reading this chapter, I don't expect you to know any more than you did before. I expect you to be like the gentleman who, after following the races for a year, stated that he

"came out even; I started with nothing and I've got nothing left." No one knows enough about credits to justify him in trying to explain what he knows. Nevertheless, it is perhaps wholesome for us to consider how little we really do know. That is good for us always, I am sure.

Credit came into existence because mankind reached a point where one man's needs for another man's goods outstripped his ability to make instant payment in things of value that the owner of the goods was willing to accept. Then came the adventures of commerce; the act of seeking the products of foreign countries in exchange for the overproduction of home-grown products. The men who had the hardihood to fare forth on this quest needed to receive credit — and they did. Upon their honesty and success — more particularly upon their success — depended the continuance of their credit. Death and disaster proved the need of evidence of these credit transactions, and bits of writing in a certain technical form came to play a useful

part in the mechanics of credit. From this beginning has been built up the credit system that partially answers our modern needs. At best it is a flimsy structure, built on faith and hope and perhaps on charity too. If the whole world were thrown into liquidation to-morrow, the whole world would be insolvent if its assets and liabilities were measured by the ruthless rules that guide a scientific estimate of credit worthiness. Hence, there are few good credit risks from a scientific point of view. And when you throw away the science of credits — as you must — what is left? Nothing but guessing.

Credit is a curious thing; sometimes as sensitive to attack as a woman's reputation; sometimes as steadfast as her virtue; sometimes, alas — but why say that? A man's credit — like a woman's virtue — is what it may turn out to be. Who can tell? But however doubtful and distrustful a credit man may be, and to some extent he must always be both, he ought to be unfailingly a good fellow — the best fellow, the most tactful, and the most

considerate in his company's whole organization. He should never send out form letters such as the young matron's husband received. He should never growl like a watch-dog. He should always remember that he is a salesman — a salesman of "charge accounts" or "lines of credit." And he should also realize that a bad "credit" is simply a bad sale of a "debit."

VIII

THE MANAGEMENT OF TRAVELING MEN

How easy it is to say, "I am managing the traveling force of So-and-So." Easy to say and sounds good, too, but it is n't an easy thing to do. In fact, I never saw any one really manage a force of traveling men.

One of the reasons why it is hard to manage traveling men can be found in a little red book called the "Official Hotel Guide." This book contains the names of most of the hotels in the United States, and a majority of them are unconscious foes to efficiency on the part of their guests as well as remarkable examples of inefficiency themselves. The bad cooking, untidy housekeeping, and general squalor of the average commercial hotel make it difficult for a commercial traveler to maintain constantly the fervid enthusiasm about his house, his goods, and his job that the man who is "managing" him counts on when figuring out the

"propositions" that are to be "put across" by the traveler.

A traveling man leaves the home office with fresh samples in his sample case, crisp new bank-notes in his pocket for expenses, and the instructions and admonitions of the sales manager at least partially remembered and understood. He is filled with determination to make this trip the biggest one on record. He will show everybody what he can do. Yes, sir, he feels just like tearing up the earth this time. He is brimming over with enthusiasm, energy, determination, self-confidence — and anything else you care to name that a traveling man should brim over with when he starts out on a trip.

"Tacks-ee-keb, sir?" Yes, why not ride down to the station in a taxi? It won't cost much more than that big imported cigar the boss gave him yesterday. So down to the station he goes in a taxi.

"Could n't get a lower for me, could n't you? Well I guess I'll have to take an upper, then." An upper berth and a nice bright light

right over his head until midnight; the junction at five in the morning with a zealous porter waking him at four-fifteen; connecting train due to leave the junction at six; saloons just opening up; cold gray morning; little drink would n't go so badly; bad habit to drink before breakfast — but then; say, that new cocktail the sales manager ordered at luncheon yesterday was a pretty tasty drink — wonder if the bartender over there could mix one; exit drummer; so much for the first leg of the trip.

The train proves to be late, but not late enough to permit breakfast uptown at the junction. It finally comes along. There is no dining-car, for this kind of a train does n't pamper its passengers. The candy butcher would think you were trying to "kid" him if you attempted to buy a twenty-five cent cigar. It's just a plain train without any frills on it. Our traveling man arrives at Brownsville in a drizzling rain. The bus bounces him up to the Central Hotel where breakfast has nearly run its course. The members of "Within the

Law, No. 13 Company" are the only guests left in the dining-room. The leading woman looks at him disdainfully and remarks to her companion: "These drummer dumps are fierce, ain't they? — Did you taste that coffee; and look at the toast, would you — and the butter — that surely must be goat-milk butter."

Our traveling man does n't hear the leading woman's comment. He only sees her — and, as he slides into his chair, murmurs to Maggie, the head waitress, "I see you've got some show people," to which Maggie replies, wrinkling her nose scornfully, "Yes, and thank Heaven they're goin' to leave on the eleven o'clock train. They're something fierce, them show people."

It's "fierce" all around. The leading woman was right when she said "drummer dumps" are fierce — at least she was right about some of them. On the other hand, Maggie was right about show people. They get pretty fierce when they go against a fierce drummer dump. People who have lived most of their

lives at actors' boarding-houses and hotels that print on the hotel stationery, "Steam heat in every room. Special rates to the profession," will go up in the air a mile when they get a week of fair-to-medium, pretty-much-on-the-average commercial hotels; but the poor old traveling man is expected to take fifty-two weeks of it, if need be, and never make a murmur. In fact, when he asks for a salary raise, the sales manager is mighty apt to say, "And you must not forget that we are paying your expenses. You're living on the fat of the land — at our expense." I know sales managers say that and believe it, for I've said it myself. It's queer how much better some towns look on the map than they do when you meet them face to face, and how much better some hotels look on the pages of the "Hotel Guide" than they do when you pull the pen out of the potato to write your name in the guest-book — no, I mean register your name under the vividly colored date slip furnished by the enterprising manufacturer who imagines that these slips are bringing his

product into prominence. I know he is enterprising, but I can't remember his name or his product. Can you?

Enough of this: Let us get back to our hero, by this time laboriously excavating with a cloudy spoon the interior of a spongy orange. He is feeling rather seedy. If any comparison can be drawn between a small orange full of large seeds and a traveling man who feels decidedly gone to seed, he is the seedier of the two. He feels, and rightly, that the Junction bartender did not make that cocktail exactly as it was made at the sales manager's club. Instead of whetting the appetite, as any well-concocted cocktail is supposed to do, this particular cocktail is exciting premonitions of an untimely headache. The lumpy oatmeal seems more lumpy; the leathery beefsteak, more leathery; and the muddy coffee, more muddy.

Out in the "office" after breakfast he moodily lights a cigar and momentarily pauses to examine with feigned interest an ammunition manufacturer's familiar litho-

graph of a sportsman shooting ducks, and a harvester company's equally familiar calendar illustrating a blonde broiler down stage in an Old Homestead costume against a back drop that depicts a wheat-field and a binder, with the company's name on the binder in letters of disproportionate size. He then moves over to a shoe manufacturer's map of the United States and discovers the interesting geographical fact that Brownsville is located on the right eyebrow of the shoe company's salesman for this particular State.

At nine-thirty he starts out to see Smith, his Brownsville customer. He does n't feel quite so brisk or confident or enthusiastic as he did the day before, when he left the sales manager's office. Then, his territory was a map containing so many towns and so much possible business. To-day, it is merely a collection of places with bad hotels and worse railroad connections. Yesterday Brownsville was a dot on the map and a possible thousand-dollar order. To-day it is an ugly country town that he wants to leave behind him as

soon as possible. Maybe he can get through with Smith in time to get away on the eleven o'clock train. Smith never was a very live wire, and there's not much use of springing the sales manager's new scheme on him. Of course, it's all right to mention the scheme to Smith, but hardly worth while to take up much time with it. "I'll get his order for what he wants and get out at eleven o'clock, I guess."

Well, he made the eleven o'clock train and had a game of pitch with three other salesmen. Nice fellows they were and all four worked the next town in three hours and got out of it together on the four-fifteen train. Two of them had intended to spend a little more time with their customers and wait for the seven-thirty train, but it did seem a shame to break up the pitch game. That night they had a real sure-enough pitch game, and our man lost seven dollars, but he did n't care much about the loss until the next morning when he got up with a slight headache. His orders for the previous day had n't been sent in, so he sat down be-

fore breakfast and, instead of the comprehensive reports he had intended to send the sales manager, wrote briefly as follows: "Was too busy last night to send in my daily reports. Inclosed find orders from Smith of Brownsville and Jones of Newtown. Best I could do. They would n't consider your new scheme, but I will try it on everybody just as you said. Want to get over the territory as rapidly as possible so as to keep ahead of Blank & Co.'s man. Will be in Summit Sunday. Change route card accordingly. Have n't had time to make up those new reports on Brownsville and Newtown. As you know, a traveling man does n't have much time to fill out reports, but will do the best I can."

The sales manager reads the letter and says to himself, "That fellow's a hustler. He's not much on making reports, but I suppose he's right: a traveling man does n't have much time." It's rather funny how sales managers fall for that "too-busy-to-make-reports" idea, inasmuch as most of them have been traveling men themselves.

Getting back to our hero again: Ten days pass, during which, by sundry economies, most of the seven-dollar loss at pitch has been absorbed by the expense account. Scarcely anything else of great moment has occurred, unless the breaking-up of the pitch-playing quartette can be so regarded. In a couple of towns the trains ran in such a way as to give our traveling man a good deal of time in each place. In the first he caught up on his reports. In the second, having nothing better to do and having breakfasted uncommonly well (good hotel there), he tackled his customer on the sales manager's new scheme. It took all morning and then two hours more after luncheon to do it, but he finally put the scheme over — which only goes to show, you know, that some merchants will take hold of a sales manager's schemes and some won't.

The hotels got no better: same way about trains; rotten weather, too. Time passed. Cosmopolis for the third Sunday. Gee! a traveling man leads a pretty hard life. Well, anyway, there's always a good bunch Sun-

daying at Cosmopolis; wonder if that plump little brown-eyed waitress is still there; she certainly was a good fellow.

The sales manager's new scheme? "Oh, I put that over with one fellow, but most of 'em don't seem to take to it and I don't press 'em very hard. The fact is, for the last two or three days I have n't mentioned it to the trade at all. I'm trying to get over my territory, you know, and get what business there is in sight. Cosmopolis for Sunday? Betchyer life."

After a while the sales manager, back in the home office, takes stock of his pet scheme. He folds up the papers and tucks them away. "The boys have even quit referring to it in their reports," he says to himself. "I suppose they don't want to rub it in on me. That scheme apparently was a lemon. Of course, the new fellow out in Iowa is doing pretty well with it, but I guess his territory is different from the rest. I'll let him go along as he's doing now, but as far as the other boys are concerned, I guess I can count on them to get

all the business there is in sight without any new schemes."

No, I'm not trying to be funny and I don't care how many sales managers and traveling salesmen read the foregoing and say, "Not me" — or I. No, sir, I don't care what they say. I know that human nature, country hotels, and local trains have wrecked more good sales plans than you can shake a stick at.

Manage traveling men? Anybody can make a traveling man call his laundry by some other name in his expense account. Anybody can make a traveling man fill out route cards and send them in. Anybody can stick tacks in a map and do the other things that tradition ascribes to the management of traveling men, but who ever really managed a force of traveling men?

I have always liked to try to manage travelers — but then there are always men who like to play a hard game. I believe in all the modern frills, including maps and tacks and geographically arranged card files with significant

colors for the cards, for a sales manager needs to have before him a graphic picture of his territory just as a general needs campaign maps and the best obtainable information about the opposing forces. However, as they are generally used, the maps, cards, tacks, etc., of a modern sales department probably do not yield a direct return commensurate with the cost of their maintenance; but unless they are very sadly misused, I believe they have a considerable indirect value. For example, a map system properly kept up is a constant accusation of the sales manager. No sales manager or sales force ever works a territory the way it should be worked; that is impossible, for perfection is never attained in any sales department; but when business is good, sales managers are prone to become self-satisfied, and the worst thing a sales manager can do is to become satisfied with himself and his department. If the true conditions are kept constantly before him in graphic form, no sales manager can ever get in that state of mind. Furthermore, the geographical point

of view must be constantly maintained if a sales manager is really going to manage sales and not let sales manage him. A gratifying volume of business does not necessarily signify selling efficiency, but an accurate knowledge of the weak points in the territory, and an intelligent and persistent attack on those points is almost certain to bring about increased sales. Among other arguments in favor of the geographical form of attack is the fact that traveling salesmen are sometimes inclined to avoid the towns where their services are needed most and are much disposed to underestimate the importance of small towns, particularly small towns that have bad hotels or poor train service.

There was once a time when a certain reaper company had very decidedly the lion's share of the reaper trade. Their binders and mowers were popular with the farmers. They were lenient in their collection methods. They had the pick of the implement dealers for their agents. They seemed as strongly intrenched as a manufacturer of a competitive article

could be. Their branch managers were the overlords of the implement business. Their traveling salesmen were envied by the travelers of all the other reaper concerns. Perhaps a part of this envy was occasioned by the fact that most of this particular reaper company's dealers were located in fair-sized towns — "electric-light towns" as they were known twenty years ago. A man who traveled for this reaper concern could on the average stop at better hotels and ride on better trains than the men who worked for the other reaper companies. Since this company had in most cases the best dealer in each of the best towns, the other companies had to take second choice in those towns. One of the other companies finally decided that it would rather have the best dealer in a poor town than the worst dealer in a good town. So the other company commenced to specialize on the small towns, and ultimately it had the electric-light towns hedged about with crossroads dealers. In a good many ways these crossroads dealers did not compare favorably with the dealers in the

electric-light towns, but they covered the territory so thoroughly that their efforts gradually brought results, and when both companies merged some ten or twelve years ago, each company was doing about the same amount of business.

The sales problems of a reaper manufacturer are, of course, very different from those of a manufacturer of high-priced confectionery or expensive corsets, but the geographical attack has a suitable adaptation for every selling problem.

The geographical attack requires the routing of traveling men — not necessarily prescribing in what order nor upon what days they shall visit certain towns, but at least instructing them as to what towns they are to visit. Some sales managers refrain from doing this and say, in effect, "Our traveling men know more about their respective territories than we do." This is a damaging admission for a sales manager to make. While a traveling man may know more about some things in his territory than the sales manager can

know or needs to know, no sales manager should permit himself to know less than his traveling men about the important territorial facts. One reason why a manufacturer who operates through branch offices is usually able to show a higher degree of sales efficiency than the manufacturer who does not, is because a branch manager, without conscious effort, acquires a knowledge of his territory that a general sales manager does not get without the most persistent effort, nor retain and make useful without the painstaking compilation and maintenance of convenient and graphic records.

But why, in an article about managing traveling men, should I talk about geographical attack and the mechanics of sales management, when the principal problem is a human problem — a very human problem? The average human mind is not very ready in its grasp of the thoughts that emanate from another mind. Even when I agree with your views and indorse your plans, I probably do not more than half comprehend the underlying rea-

sons that have influenced them. Accordingly, when I attempt to carry out your plans, I fall far short of doing and saying all that you had in mind. I may omit to do or say the very thing that would have made your scheme a great success.

I am quite sure that not more than one traveling man in ten fully understands what his house is trying to accomplish. This is partly the fault of the traveling man and partly the fault of the sales manager — mostly the sales manager's fault, I think. Of course, the traveling man knows that his house wants him "to go out and get the business"; but he rarely has that sympathetic understanding of the sales manager's selling schemes that would enable him to put in those finer touches of salesmanship that correspond — for example — with the suppleness of a champion billiardist's wrists or the delicate sensitiveness of a premier jockey's hands. Speaking of billiards in comparison with salesmanship, the attitude of the average traveling man toward salesmanship is a good deal like my own atti-

tude toward billiards. I know that three balls are used in the game and that if I make one hit each of the other two, I thereby score a point; but I have never taken the trouble to study either angle or stroke, and I play no better game to-day than I did ten years ago. The average traveling salesman takes the same pains to comprehend the true inwardness of his sales manager's plans as I have taken to master the true inwardness of billiards. This is partly because scarcely anybody can exactly understand the ideas of anybody else, but principally because scarcely anybody really cares very much about the ideas of anybody else.

When you explain your ideas to me, you must do one of three things to get me to make an intelligent and sincere effort to carry them out. You must either make me think they are my own ideas, or you must intimidate me, or you must be very, very convincing — more convincing than I have ever yet known any sales manager to be.

Now we have arrived at the kernel of the

matter, and if there is any value in this article, here it is: Sales managers issue instructions and counsel with the fatuous belief that such instructions and counsel are studied, pondered on, understood, and heartily indorsed by the traveling men who receive them. Not once in ten times is this the case. A traveling man may take any one of a dozen different views when he receives instructions from his manager. Here are some of them: (1) "I'm always willing to follow instructions from the house, but I know these won't work in my territory and I'll soon convince the house of that." (2) "What does this fellow know of conditions in my territory? This may be all right in other territories, but not in mine." (3) "I guess this guy thinks I don't know how to handle my trade — wants to tell me just how to do it." (4) "What do you know about that! — trying to tell me — me who was in this business before he was out of grammar school!" (5) "I'm going to quit — if I can get another job." (6) "That's what I've been doing right along — not just that way, but

the same thing; thinks he can tell me something, does he?"

These are some of the things traveling men say when they get your letters of instruction, Mr. Sales Manager. Now and then a new man or some chap who has taken a fancy to you will say, "That's a good idea," but you must figure that he probably doesn't more than half-understand what your idea is, and if he does, his enthusiasm and interest are not likely to survive a week of bad hotels and bad train service.

When I am managing traveling salesmen I try to remember that I am managing a bunch of the finest fellows in the world, who are up against a mighty tough game. I try to remember that they know a lot about the business — more about some phases of it than I do. I am willing to let them help me form the sales policies of the company. I like to get them all together and "choose up" sides like an old-fashioned "spell-down" contest. One side represents the customers' side — the buying side; the other side represents our side —

the selling side. Then we go to work and collaborate on a complete selling plan. The fellows on the buyers' side try to spike or blow up the guns of the fellows on the selling side. Sometimes we spend a whole day on a single point, and before we finally decide what it is best to do and say on that point, every one — both the buyers and sellers — must agree that the thing we have decided on is the very best thing to do and say. Point by point we work up a complete sales plan with the exact detail and dialogue of the approach and all of the subsequent steps of a sale. When it is finished, each of the traveling men solemnly subscribes to the fact that it is his plan — not mine — and fares forth to slay the trade with a weapon of his own fashioning. Even so, I have heard that some of the solemn subscribers later went back on their solemn oaths and said it was all — well, you know what kind of foolishness. However, that does n't matter, for I have used this method for several years and, on the whole, it has been successful; although, after an interval, country hotels and local trains will

reduce almost to zero the effectiveness of any selling plan that can be devised.

With reference to the second method of getting traveling men to embrace unreservedly a sales manager's schemes, namely, scaring them into it, I must confess that I have never tried that plan. When a traveling man doesn't do what you want him to do and persists in his obstinacy, he ought to be dismissed, and his dismissal probably has a good effect on his fellows, but I have never been able to bring myself to dismiss any one in a way to accomplish that effect in the fullest degree, which is probably one reason why I am not a very good sales manager.

As to being convincing with a traveling man — well, if you can be that, you don't need to read this or any other article on the management of traveling men, and probably haven't.

I am practically through. I could talk about expense accounts, I suppose, but that is a delicate subject. It is a noteworthy fact that most of the men who now sit at sales mana-

agers' desks are men whose expense accounts in their traveling days were extremely moderate. I don't know of any sales manager who was ever an expense-account grafter — or who even tried to "break even" when he was on the road. I know I was n't smart enough to do it, and when I was called into the home office to take a position there, I actually didn't know enough to charge up my railroad and sleeping-car fare. I thought my job ended while I was on the road, and that my new job did n't commence until I arrived at the home office. Can you beat it?

I have written quite a lot about the management of traveling men. There is a lot more I should like to write, but it scarcely has a place here. I believe in letters of a certain sort ahead of the travelers and letters of another sort — to which they contribute — behind them, but that again gets into the mechanics of the game, so I shall have to confess that the foregoing is all I know about the broad principles of the very difficult science of really and truly managing traveling men —

except one thing: go easy on the "bawl outs," and if possible, temper with some praise every letter of criticism; if that is n't possible, it's pretty nearly time for something stronger than criticism.

CHARLES A. SCOTT

PREFACE

THIS book gives you the hard and fast methods of *modern merchandising.*

It is so simple that however little you know about business you can understand it, and it is so practical you can use it at once and with telling effect.

What we have written is the result of long years of experience in the merchandising field, that is, the buying and selling of goods. To make this book make you money:

(1) Read it through to understand it as a whole, and then read it through again and memorize the vital points in it.

(2) Look around and about you and see just how every *fundamental principle of merchandising* is applied by your successful competitors in your line of business.

(3) If you are *failing* in business find out why and how to remedy the situation, and

this you can do by seeing just where your methods are different from the *broad highway of success* which we have laid in this book.

(4) But if you are *prospering* read the following pages anyway and you will learn the secrets of bigger business and of greater success.

This book will start you *right* in the field of merchandising where ninety out of every one hundred men are failures. And they fail simply because they do not know the basic rules of the selling and buying game. It behooves you, then, to read this book and heed its precepts.

Successful Selling

Putnam's Handbook of Buying and Selling

CHAPTER I

FIRST PRINCIPLES OF SELLING

Before Selling Was Invented—How Selling Came to be—What Salesmanship Is—The Natural Born Salesman—The Art of Salesmanship—The Science of Making a Sale—Getting Acquainted with your Customer—Attracting your Customer's Attention—Rousing your Customer's Interest—The Desire to Own—The Resolve to Buy—The Effect of Positive Suggestion—Knowing your Competitor's Goods—Various Kinds of Selling.

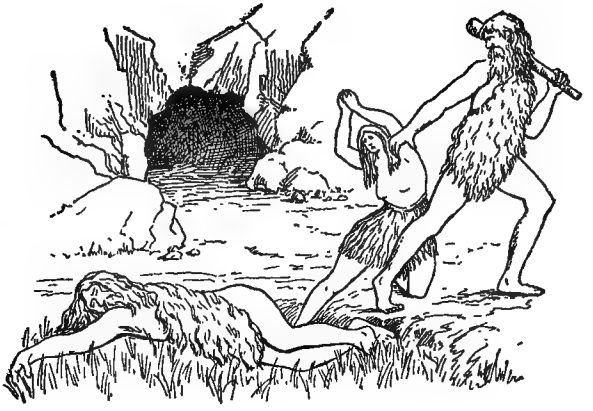
In the long ago when man made his *debut* on the face of the earth his first crude thoughts were of possessorship. As there was nothing his neighbor had that he wanted except his daughter, he set out with a club, and he either brought her back to his cave or gave up his ghost in the attempt. There was no exchange here, fair or otherwise, but robbery pure and simple, yet it was the only way he knew to get what he wanted.

A good many thousands of years after when he had learned to make a few things out of feathers, bone, and stone, and he had developed the art of expressing his thoughts a little by *speech*, as we call it, he found it an easier, safer, and better policy all round to give the old man something first and so induce the latter to give him the girl in turn. In this primitive way, then, began, not only the fashion of matrimony, but what is of far more importance, the exchange of values that came to be known as *bartering*. See Fig. 1.

How Selling Came to be. Now bartering, as you have just seen, means to exchange or trade objects whose value is supposed to be equal, as, for instance, horses, or a piece of goods for a dozen of eggs.

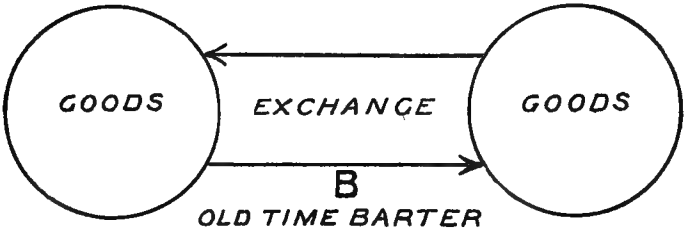
Selling, on the other hand, is generally understood to mean the transfer of some kind of goods for *money*, and, indeed, money was invented to make the transfer of merchandise a simpler, easier, and cleaner-cut proposition. In the final analysis, though, the same fundamental principles that underlie bartering also obtain in selling.

Not only this, but what is just as true is that



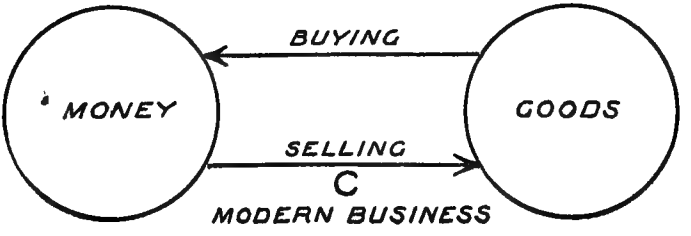
A

Prehistoric Robbery



B

OLD TIME BARTER



C

MODERN BUSINESS

FIG. 1

human nature is the same now as it was in the stone age, and where the early savage tribes bartered for things of imaginary value such as charms, amulets, and fetishes, we moderns are just as prone to buy art objects, antiques, and the like merely because we think we want them and not for their intrinsic, or actual worth. And thus like the untaught savages we are apt to deceive ourselves, or let some salesman do it for us.

After the invention of *money* the transfer of goods from the seller to the buyer was an easy matter, and especially so when the prices of certain staple things got to be about the same everywhere, that is, the prices at which commodities were sold became more or less fixed. This being true it was soon found necessary to use persuasion if a man was to successfully sell his goods where he had active competition, or to put it another way, he had to show to all intents that his goods were cheaper, or better, or both, than the other fellow's and this was the beginning of what we call *salesmanship*.

What Salesmanship Is. Of course a *salesman* is a man who sells goods in a store, on the street, or by canvassing, and while all men who

sell are called salesmen, very few of them indeed have the faintest idea of what real *salesmanship* is or how to apply the principles of it.

Now let's see first just what salesmanship is. To explain it fully is the purpose of the first part of this book and, as you will learn as you read along, there is considerably more to it than simply handing out something in an original package and taking money for it. But it can be boiled down into a concise and fitting statement which expresses its basic element thus: *Salesmanship is the power to convince and cause buying action.* The Eternal selling circle shown in Fig 2 illustrates this.

The first thing, then, that you must know and practice and employ if you want to become proficient in the art of salesmanship is to make use of your *power to convince.* By this we mean that you must group your thoughts in logical sequence and then clothe them in language that carries conviction with them. In other words know what you are going to say and then put a *punch* in it when you do say it.

Human nature is like electricity in that there is only one kind, but like electricity also there are several phases of it, and this accounts for

the various attitudes of different buyers. A stereotyped talk based on the right lines of salesmanship is bound to get a favorable re-

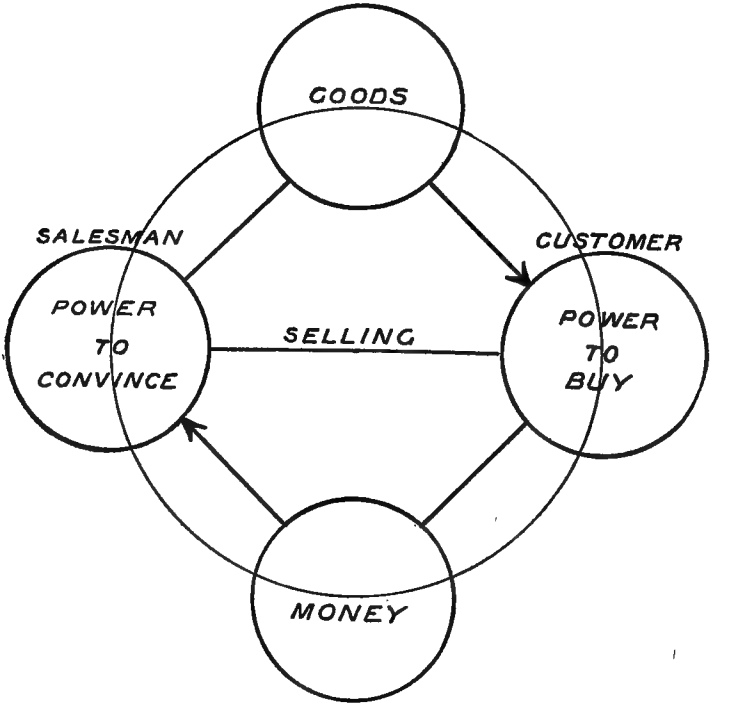


FIG. 2.—THE ETERNAL SELLING CIRCLE.

sponse from buyers as is evidenced by a patent medicine man who sells his wares from the tail end of a wagon. And he would sell them to all of his audience but for the fact that each

one has his own little peculiar phase of human nature.

This is the reason a selling talk that will convince one man may not be equally convincing to another man, but every man is susceptible from a selling point when you know his particular brand of human nature. To find out what his brand is, talk to him for awhile when it will crop out and you can then deliver the argument for which his case calls.

The Natural Born Salesman. Just as some men are natural born inventors, mathematicians, musicians, writers, etc., so many men, yes, most men, have a natural aptitude for selling—in fact, they are known as *natural born salesmen*. This is not at all strange when you consider that the human race has been bartering or selling the output of its hands, or brains, or both, ever since Adam.

A natural born salesman possesses innately the requirements of thought, speech, personality, shrewdness, and sticktoitiveness, to make him, for the time being at least, the superior of the buyer. It is when such a salesman begins to study the more or less scientific end of selling that he becomes a dominant factor in the

business world and his earning capacity runs up to five or six figures a year.

The Art of Salesmanship. If you are not a natural born salesman don't give up the ship because, as we said above, you have probably inherited your share of selling ability, and what you haven't inherited you can acquire through study and practice.

Now salesmanship in its fullest sense is a pretty complex thing but still it is scientific enough so that you can learn it just as you can learn physics, chemistry, or mathematics only it is easier and you get paid for it while you are learning.

Learning salesmanship, however, does not mean that you have to sell goods until you know how, though this is the usual way that salesmen are turned out, but very few of them rise above the level of mediocrity by this method.

To learn scientific salesmanship means that you take all the correlated facts that are known about the processes involved in selling and use them according to certain well-defined rules. Since these facts are largely founded on philosophy and psychology, salesmanship takes

on the aspect of a real science, if you please, and hence it can be treated as such.

The Science of Making a Sale. To put a selling proposition before a customer you must lead his mind through several successive stages, beginning with getting his attention, and ending with making him resolve to own that which you have to sell and finally, what is the really important part of the transaction, to part with his good money for it.

There are five vital steps through which your selling talk must pass if you are to make a sale. An ordinary salesman usually employs two or more of these steps, but a trained salesman uses all of them and in their logical order and unless he does so his chances are about as 1 is to 10 for making a sale.

These five stages are (1) the *introduction*, (2) *attention*, (3) *interest*, (4) *desire*, and (5) the *resolve to buy*, all of which are graphically shown in Fig. 3.

The Introduction. In this step you introduce yourself to your customer and you must take care to make a good impression on him for much depends on it.

If you create an unfavorable impression you

will have to fight the odds against it all through your next four steps, and since these depend on the unbiased attention of your customer you will find it mighty uphill work and in the majority of cases you will lose out.

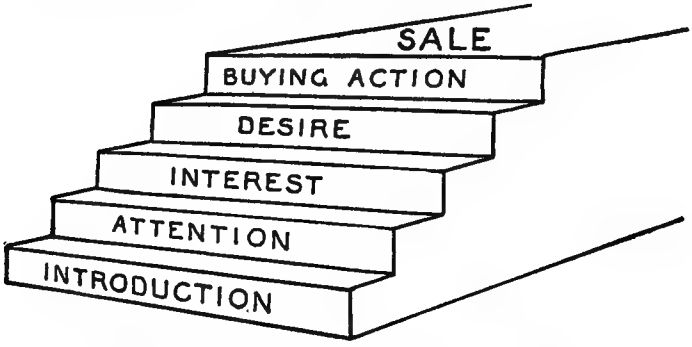

FIG. 3.—THE FIVE STEPS LEADING TO A SALE.

It is in this preliminary stage that you and your customer, if he is a new one, get acquainted with each other and in which he gets your mental number so to speak, that is, an impression of you; but it is not an altogether one-sided game for at the same time you size him up, conclude what nature and manner of man he is, and decide on the best method of attack. From this you will see that the better the impression you make on him the abler your deductions are concerning his idiosyncrasies.

Attracting your Customer's Attention. The quicker you can focus your customer's attention on the goods you are going to sell him, the better. There are two reasons for this, namely, (1) it takes his mind off of his own or someone else's goods, and (2) it starts a train of thought in him about your own goods.

It is your job to direct his thoughts into favorable channels which you do by literally jamming them into his head in the next three steps. To do this you must know two things and these are (1) what your customer wants and what he needs, and (2) what goods you have that meet his requirements and why they do.

A working knowledge of these points is absolutely essential for you to successfully carry on the next and fourth step; you will know part of the answer before you meet your customer and the next part of it you will decide by the evidence that you will be able to gather during the introduction step.

Rousing your Customer's Interest. To arouse and accelerate your customers' interest in the goods you are selling you must be interested in them yourself and know about their

manufacture and uses. From these facts you must pick those which you know will concern your customer and by your direct, elucidating, or ingenious manner, of describing your goods you soon grip your customer's interest as in a vise.

Some salesmen draw their customer's interest by a lot of palaver or irrelevant talk, and while this works in some cases the best policy is to stick to the goods at hand and make them the object of interest.

In the unsophisticated days of the horse-car, the kerosene lamp and the whatnot, a salesman, like the orator, always prefaced his subject by relating one of the seven original jokes or some modification of it, but in these times of airplanes, wireless, and player-pianos business men as a rule don't like things that are not to the point and to the purpose.

The Desire to Own. When you have thoroughly aroused your customer's interest in your goods his mind is in a highly receptive state for you to create a desire in him to own them. As we said before you must know what your customer wants and needs, also how and why your article suits his needs.

To make your customer want to own your goods you must show him the advantages that will accrue to him by owning them. When you see that you have fostered his desire to own them far enough you lead your customer without further parley into the fifth step which is

The Resolve to Buy. When you have led your customer's mind through the last four stages successfully it will be easy for you to bring this last and highly satisfying stage to pass, but you must in any event follow a definite procedure as in each of the other steps.

This you do by *positive suggestion*, that is, you skillfully inject into your customer's mind the suggestion that he buy the article; we say *skillfully* because any other method will make your customer, to put it figuratively, shy, rear up, and buck off of the saddle of your efforts.

The human animal we call *man* is just enough of an egoist not to want anyone to do his thinking for him and consequently the moment your customer realizes that you are doing his thinking for him it puts him in an aggressive state of mind instead of in a receptive mood.

The Effect of Positive Suggestion. While what we are about to say applies to the last step, that is *the resolve to buy*, still it holds good for all the other steps as well. By a *positive suggestion* we mean the art of influencing a customer by making statements which are always positive in value.

Never use a *negative suggestion* when you are making a selling talk. As an example, here is the way in which the sale of a car was lost by a negative suggestion. The salesman's line of talk had worked up a desire in his customer to own the car but when he reached step number five, that is where he was ready to close the deal, he offered a negative suggestion after this fashion: "Now, Mr. Brown, will you or will you not buy our car?" Mr. Brown having received the suggestion that he would not buy the car seized upon it and answered with an emphatic "No," and the sale was lost.

Now here is an illustration of positive suggestion: Another salesman selling Mr. Brown a different car the next day reached step number five and then he said gently but firmly: "Will you drive the car home yourself or shall I send it to your garage?" This suggestes to

the customer that he is already the owner of the car and as a rule he will choose one or the other of the alternatives, thus closing the sale.

You observe that the salesman's question does not leave any opening for the customer to say, "No, I don't want the car," if he answers the question direct. A magnifying glass is not necessary to see the big advantage of having every statement you make a positive one.

Knowing your Competitor's Goods. It is not enough for you to know your own goods but you must know your competitor's goods as well. Take particular pains to discover why your goods are *better* than your competitor's and not why your competitor's goods are *worse* than yours. A salesman who *knocks* a competitor's goods by showing how much worse they are than his own often arouses in a customer a sense of distrust of the salesman and a spirit of sympathy for the poor competitor.

The customer quite rightly considers that the salesman is taking an unfair advantage of a rival who is not there to defend himself and such a feeling is not conducive to making a sale. To point out how your goods are better

than any of your competitor's is, however, not only legitimate but it does not leave an unfavorable impression, for again you are making positive statements.

The best policy is never to bring up your competitor's goods at all unless they are mentioned by the customer. Then in making comparisons don't point out the superiority of your goods over those of any one competitor, but make the comparison with the goods of all your competitors as a whole and without mentioning any names. This has a much better effect than bluntly and crudely pointing out why your goods are so much better than those of the *Silko Company*.

Various Kinds of Selling. There are two kinds of salesmanship and these are (1) the legitimate selling of articles of merit and (2) the bunko-selling of wildcat stocks, gold-bricks, the Brooklyn Bridge, and other like kinds of blue sky.

The first kind of salesmanship is the only one that pays in the long run because there are no come-backs. A salesman who sells only good goods is always known as a man of integrity. He keeps the friends he makes and

always has a job. He is in very truth a prince among men.

A salesman of goods having an imaginary value and sometimes existence is generally in disrepute and soon loses his friends, if he ever had any, is often without a job, and to say that his reputation is shady expresses the situation mildly.

His ability as a salesman is just as great and sometimes a little greater than the salesman who sells legitimate goods but his energies are misdirected and sooner or later he will meet with ruin. The idea we are driving home is *never to sell goods that you haven't absolute confidence in, and you'll succeed.*

CHAPTER II

HOW TO GET A MASTER SELLING FORCE TOGETHER

The Traveling Salesman Back There—The Need of Organization—The Value of Organization—The Organization of a Modern Selling Force—What the Sales Manager Does—Getting your Selling Force Together—On Hiring Salesmen—A Useful Question Form—Mapping out Territory and Routes—About Handling Side Lines—What System Does for Selling—The Card Index System—Doctoring up Sick Sales—Keeping your Force Going Strong—The Balanced Force—The Understudy System—The Competitive Spirit.

AFTER the Franco-Prussian War was fought in 1870, France was forced to pay Germany an indemnity of thirty million dollars. A transaction involving an amount of money of this magnitude was in those days quite beyond the grasp of the minds of most people and even among financiers it seemed a gigantic sum for one nation to have to pay to another.

To-day there are any number of going concerns in the United States whose profits annually exceed the above named amount while the war indemnities that Germany and Austria

must pay the Allies will run up into billions of dollars. From this it is clear that the commercial world has learned to think in billions as easily as it formerly thought in millions and as a consequence business has assumed a correspondingly greater magnitude as shown in Fig. 4.

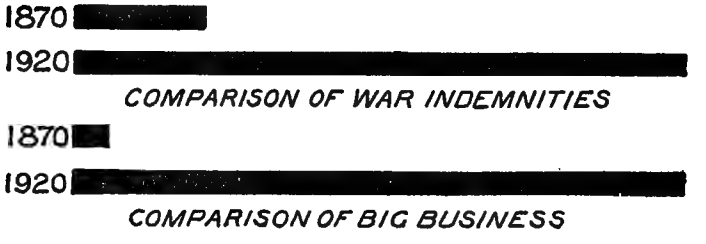

FIG. 4.—INCREASE IN MAGNITUDE OF BUSINESS IN PAST 50 YEARS

The Traveling Salesman Back There. In those *passé* days of loose ideas all kinds of businesses were run on a meager scale and an indefinite basis and hence there was scarcely any attempt made to organize a selling force nor was there any real effort made to systematize the selling of goods.

For instance a firm that employed traveling salesmen would send them out in a higglety-pigglety fashion with their ancient sample cases, and a very hazy idea of the territory

they were to cover. The rest was left to luck and the ability and honesty of the drummers, as they were called, themselves.

There was no way while the latter were on the road for a firm to ascertain even roughly the part each one of the above factors played in the results that he produced. Of course it was evident from the sales returns made by any one drummer when he had made good, but whether this was the result of genuine effort on his part or due to lucky chance, or to a combination of these elements, could not be determined with anything like a fair degree of accuracy.

Moreover most salesmen were prone to work their drawing accounts to the limit and, on top of this, their expense accounts often seemed, and were usually deemed, to be *padded* out of all proportion to the sales they made. If a drummer was honest, his accounts when checked against his sales would often put him in a bad light, while if he was dishonest he could more often *get away* with it.

These unjust conditions obtained because there was no means by which a firm could secure *bona-fide* information as to the actual state

of affairs under which a salesman was working and this prevented the members of it from doing anything more than making a guess at his real worth.

From all this you will readily see that there was much room and large opportunity for improvement, and firms which were pushing ahead and believed in a progressive policy began to inject the germ of organization into their various departments. The value of organization was so obvious it was soon realized that the selling force, which was the most important department of all, ought also to be organized, though this at first was a very difficult matter.

The Need of Organization. Clearly what was needed was some kind of an organization which would make it possible to weed out the chair users and account padders from the real workers of the selling force, for if this could be done it would, of course, greatly increase the efficiency of this departmental branch and, reciprocally, reduce the cost of selling.

Further such an organization would enable a firm to discover why sales sometimes dropped off unexpectedly in certain sections of the

country and why they picked up in other sections. And of even greater value it would enable the firm to predict beforehand the probable selling conditions that the salesmen would encounter and prepare them to meet the market, whether favorable or adverse, accordingly.

Naturally if an organization could be effected that would fulfill these conditions it would be of immense advantage to the firm having it, for it would permit it to keep a constant watch on and adjustment of the selling force and in this way it would prevent financial loss during slack times, and too, effectually and hence profitably meet booms in trade when they occurred.

The Value of Organization. Success in business as it is now carried on depends on organization, for without the latter there can be no placing of responsibility. The chief object of organization in business is that (1) there shall be no confusion in the performance of duties, (2) there shall be no overlapping of duties, and (3) that every department shall have a definite head upon whom the responsibility for its operation rests.

Such an organization is a valuable aid in any business, for it greatly facilitates transactions, however complicated they may be, and by means of it, flaws, faults, and mistakes can be discovered. Thus not only can the blame for their origin be fixed but, what is of more importance, they can be corrected or eliminated in time to prevent them from costing the firm money or, what amounts to the same thing, making the firm lose money.

The selling force, then, like any other department of a business, must be well organized in order that it can be made highly efficient—that is, so that it will do the most work and produce the greatest results in the shortest time, with the least trouble and at the smallest expense.

The Organization of a Modern Selling Force. Now there are two kinds of selling forces and these are (1) the traveling force and (2) the stationary force. The purpose of this particular chapter is to tell you about the former while detailed information on the stationary force is given in the chapter on *Selling Over the Counter*.

It is a comparatively easy matter to direct

sales operations when you have the men right under your eye, so to speak, but it is a much more difficult performance to look after a force when the men who form it are a thousand miles away from you and scattered to the four corners of the States.

To get back to the point in question there are two chief parts to every selling force and these are (1) its brains and nerve center, by which is meant the *sales manager*, and (2) its body, and this is, of course, made up of the salesmen. Fig. 5 shows the organization of a traveling sales force.

A point to be remembered is that no matter how clever are the individual traveling salesmen of the selling force, if the latter hasn't an expert sales manager at its head it is like unto a perfectly good human body actuated by a half-witted brain. From this you can see that as much, if not more, judgment must be exercised in the selection of a master salesman for your sales manager than in the selection of the salesmen themselves.

What the Sales Manager Does. The sales manager, as you will gather from his title, has complete charge and control of the selling force.

It is his job to map out the territory and the disposition of the salesmen over it; it is he who

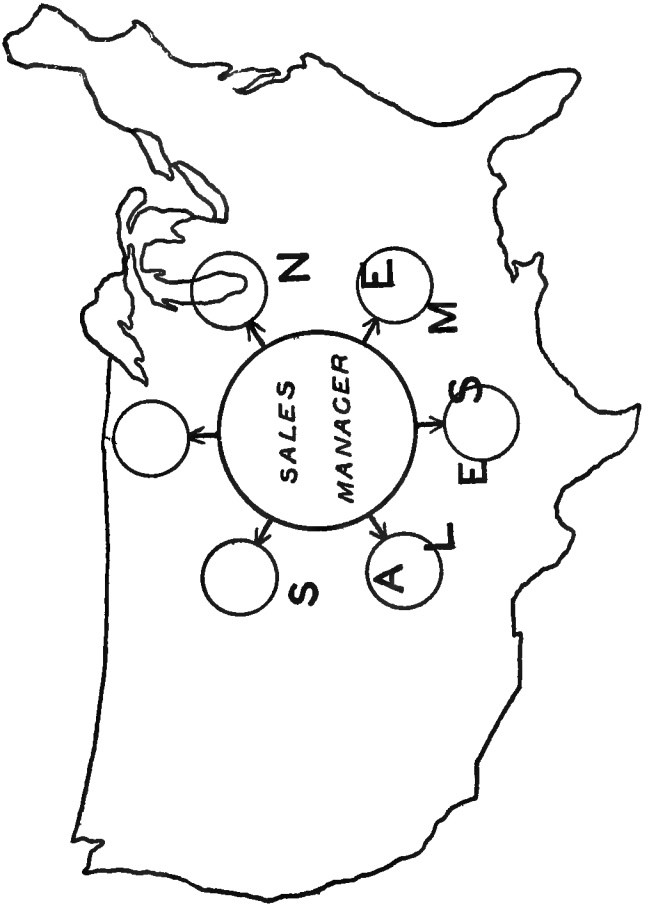

FIG. 5.—PLANETARY ORGANIZATION OF A SELLING FORCE.

creates the selling policy and builds up the selling schemes within his department. As a

matter of fact the sales manager does everything but go out and sell the merchandise himself, and sometimes he even does this.

To be able to do all of these things successfully the sales manager must, first of all, be a master salesman himself and second, since his success depends in a large measure upon how faithfully the salesmen who make up his force serve him, he must be a leader of men as well. This means that he must dominate the minds, command the respect, and have the confidence of his men at all times no matter where they are.

In the early days of sales organization the sales manager was usually looked upon by the selling force with disfavor, if not indeed with distrust, for to the old line drummer he seemed to be a meddlesome and wholly unnecessary adjunct. Gradually, however, it was found that the sales manager was not a stumbling-block in the salesman's path, but that his sole purpose was to work with and help him all he could.

Then as time went on the sales manager was looked upon by the salesmen under him with more and more favor, until now he is recognized

as an indispensable head of the organization for he is not only willing to solve the problems his men run up against, but assuming that he knows his job he knows just how to do this. In this and many other ways he takes a great responsibility from the shoulders of his force. Thus while the sales manager is first, last, and all the time a specialist in selling, he must also have a genius for organization.

Getting your Selling Force Together. When you are breaking into the field of merchandising and you want to get together a selling force the first thing to do is to secure a capable sales manager. Now while you might sometimes find it expedient to take on a more or less experienced salesmen, never engage a sales manager who is not experienced for no one can handle a selling force but an expert, and experience is the only school that turns out experts at the selling game.

In Chapter IV we have given a number of cardinal qualities that make for successful salesmanship and an efficient sales manager should have these qualities to a goodly degree plus an abundance of executive ability. He will then be able to direct salesmen under him

who are not so liberally endowed and under his guidance they may do nearly as well as he could do himself. So in selecting a sales manager satisfy yourself that you are getting the best you can afford and strain your exchequer to afford the best.

On Hiring Salesmen. As the head of the firm you will have personally to select the sales manager. If your judgment has served you well your troubles are over for he will be more competent to pick the rest of the selling force than you are.

Indeed this is a part of his job and you should by all means let him do it; further, since he is to be their director, and since they must recognize him as their supreme chief, it is only fitting and proper that he should not only choose but hire them. It is easy to see that if you take it upon yourself to hire them they will naturally consider you as the boss and while this may seem the logical thing to do, coöperation will fly out of the window and the future efforts of your sales manager will be less effectual.

The thing to do then is to give your sales manager full swing and let him hire the sales-

men, for then they will feel they are directly responsible to him and this desirable relation can be gained in no other way.

A Useful Question Form. A form embodying the following questions may prove of service in determining the merits of applicants, especially where you have to deal with a large number of them.

(1) State last position held and in what capacity.

(2) Give reason for leaving last position.

(3) The products you are familiar with and those you are capable of selling.

(4) Territories you are familiar with.

(5) References.

(6) Salary you expect.

Mapping out Territory and Routes. The next thing your sales manager does after he has hired the selling force is to map out the territory each man is to cover and to route it. In doing this he takes care that the allotments do not overlap each other and that the one given to each man is the one he is capable of covering the best.

Many a salesman has fallen down because he was given territory which he believed he could

not handle. The secret of successful selling depends to a very considerable extent upon the salesman's confidence in himself and the feeling that everything is right.

Being an old-timer at the game, the sales manager will assign each man to the territory for which he is best adapted, map out the routes, and figure out pretty closely what their expenses will be. After he has done all this he will submit his plan to you for your approval.

About Handling Side Lines. One thing both you and your sales manager must insist on, and that is your salesmen must not handle side lines, except a side line of joy. By this is meant that they must not carry other samples and try to sell other goods for other individuals or firms while they are working for you no matter how little of their time it takes.

The reason for this is that a salesman who handles a side line simply cannot give your business his whole-souled and undivided attention, and as a result your business will suffer.

Very often a salesman who handles a side

line will work for less money than one who does not, but in the long run you will find that he is not only expensive but actually detrimental to you. Your sales manager will make his men understand from the start that he will not tolerate side-liners and he will enforce this rule by discharging from the force any salesman, however good, who is found disobeying this order.

In more than one instance a salesman has started out for a firm who gave him a drawing account. In due time he took it upon himself to carry a side line simply to buy shoes for the baby. The next time we meet him his side line has become his main line and the latter has dropped into second place and the firm who financed him is getting a cold deal.

What System Does for Selling. System is a vitally necessary adjunct of organization. Where organization facilitates the transaction of business through the distribution of duties, system facilitates the transaction of business in virtue of reducing these duties and lightening them as far as possible.

Every sales manager has his own ideas as to the installation of a selling system and we can

safely say that there are at least a hundred different kinds in use. In general though they are all based on the same definite fundamental principle, and hence they are simply modifications, variations, and ramifications of the original principle. When your sales manager has put up his system to you and you have found it to be sound, let him go ahead and install it and use it in his own way.

The basic principle of selling systems is simply a means of keeping in touch with each salesman day by day. There is only one way to do this and that is by correspondence, or as it is called, *paperwork*. Now paperwork of any kind, however needful, is always a bugbear to everyone who has anything to do with it, and the larger an organization becomes the more paperwork is necessary to take care of it.

Not infrequently what would otherwise be a smooth-running piece of machinery becomes so clogged by its paperwork, which the system necessitates, that it stops the wheels of progress, as for instance is often the case in the army.

The more complicated the system that is used in selling, the more of the traveling sales-

man's time it takes from his work, the more time and space it takes up in the sales manager's office, and the harder it is to get at it when it is needed. Consequently an efficient system is one in which the paperwork is minimized to the greatest possible extent, and it is the concensus of opinion of sales managers that an *abridged card index* system provides this in the simplest and best way.

The Card Index System. There are three important items of information that a card index system must contain, and these are (1) a report of the sales made by the individual salesman; (2) a report on the prospective customers visited and in line for sales; and (3) a report of the expenses incurred by the salesman.

With this data received every day the sales manager can keep a close grip on the selling situation in the various territories his force covers and also on the individual work of each salesman.

A good form for this information is a card of such size that it can be conveniently filed as shown at the left in Fig. 6 which is the obverse side and at the right which is the reverse side. One of these cards is filled out every day by

the salesman at the hotel, on the train, or any other place where he may have the time and inclination. He can do it in a few minutes and

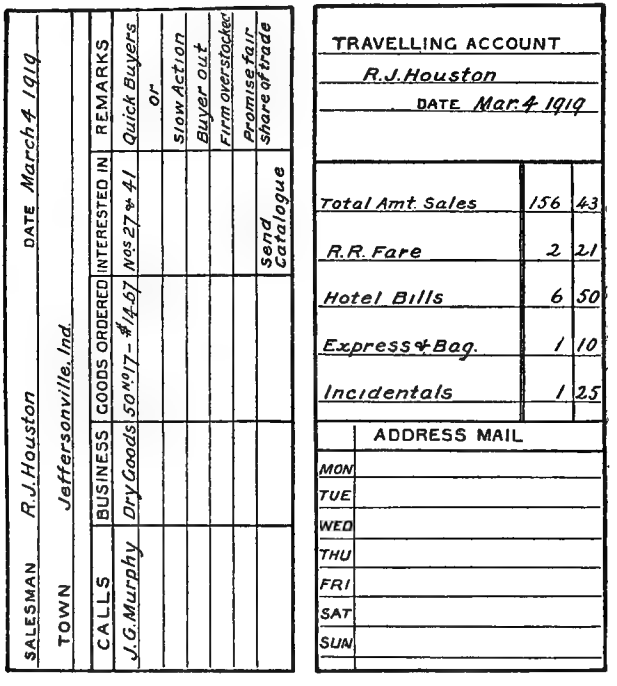

FIG. 6.—SALESMAN'S REPORT CARD.

without inconvenience, and when done he has only to enclose it in a stamped and addressed envelope and post it.

These index cards get away from the former tiresome long-winded letters in which the

salesman either boosted his abilities when things were middling fair, or knocked the conditions, and everything else but himself, when sales fell off.

Doctoring up Sick Sales. The sales manager's work does not end with the card report system. Besides keeping tab on his salesmen with it there are other means by which he keeps in touch with the various conditions as they actually are and this enables him in a measure to verify his report cards.

There are two things that he receives from every business center around which his salesmen are working and these are (1) newspaper clippings of financial conditions and bank clearings and (2) weekly weather reports.[1] Here is a concrete example of how this information is made use of.

Suppose that Jones, a salesman, is covering a rural route. From his card reports Brown, the sales manager, discovers that Jones's sales are steadily dropping off. To offset this, Jones has written in and explained that it is due to a local financial depression owing to the failure

[1] These can be obtained from the U. S. Weather Bureau at Washington.

of the crops in that section caused by a late spring frost.

Comparing these statements with his financial clippings and weather reports of that locality, Brown observes that there has been no decrease in the bank clearings, that the weather has been favorable for crops, and that everything is as rosy as could be. The sales manager knows that Jones's hard-luck story is false and that for some reason or other he is laying down on the job. Consequently Brown writes Jones a letter, containing a few facts and much good advice, with the result that when the latter reads it he is more or less surprised and sees that the only thing for him to do is to buckle down to business and he usually does it.

Keeping your Force Going Strong. There are many things that could be said about how to keep your selling force *going strong*, that is up to its highest efficiency, but the three following points are the most important, namely: (1) the *balanced force*, (2) the *understudy system*, and (3) the *competitive spirit*.

As an illustration of the balanced force, suppose Brown, the sales manager, has three salesmen, Jones, Wilson, and Williams, covering a

certain territory in the fruit belt. Through the bank and weather reports Brown finds that the clearings are falling short of the normal and that a cold wave is expected.

It does not take much analytical power on his part to know that although the sales have not yet dropped off they will soon for the cold wave will kill off the early fruit and then money will get tight.

What does the sales manager do? Why, he withdraws Jones and Wilson from the doomed territory at once and puts them on another assignment where there is every indication of coming prosperity. In this way he keeps his force *balanced* with the financial depressions and rises as they occur, and he is thus able to cope with the former and meet the latter successfully.

The knowing sales manager will have for every one of his important salesmen an *understudy* who can take his place on short notice. Then in case of sickness, desertion, or the death of a salesman, the situation can be saved without loss of time.

One of the things that tend largely toward the maintenance of an efficient selling force

is the promotion of a competitive spirit between the salesmen themselves and between his force and the forces of rival concerns by the sales manager. In virtue of his personality a clever sales manager can instill this spirit in his salesmen, for, since they are only human, they will often appreciate his praise as much, nearly, as a more substantial reward, and especially is this true where the commissions are liberal. The competitive spirit will never flourish where starvation wages rule, on the other hand the profit-sharing system of rewards is a mighty fine plan to foster and maintain it.

But whatever the scheme used for this purpose is, care must be taken that it does not discourage any salesman and so cause him to lose interest in his work.

CHAPTER III

HOW TO PICK LIVE WIRE SALESMEN

The Need of Live Wire Salesmen—Live Wire *versus* Jim Crow Salesmen—Varieties of Salesmen—The Qualities of High Grade Salesmen—On Personal Appearance—About Wearing Apparel—*Re* Facial Characteristics—A Vigorous Personality—The Physical Body—The Mental Self—Conversation—Using Tact—Good Memory—His Moral Fiber—Picking Live Wire Salesmen.

IF you are a *live wire* salesman yourself, you will have small trouble in knowing another live wire when you see one, and none at all in picking him out from among his less gifted brethren.

On the other hand if you are starting a business which requires a selling force, as nearly all of them do, and you are new at the selling game yourself, you will be at a loss to pick out from among the large number of applicants who present themselves as first-class salesmen those who are really aggressive and those who only think they are.

The Need of Live Wire Salesmen. There are two chief ways of selling goods and these

are (1) by direct sales made by salesmen and (2) by reaching the customer through the mails. The first is the way we shall take up here for the second is a separate and distinct branch of selling which we will consider later, but in any event practically every business must employ salesmen in some capacity or other.

It goes without saying that it is not nearly as hard to keep up an efficient selling force in an established business, as it is to organize such a force for a business that has just been started, and it stands to reason that anything less than an A1 force of salesmen at the beginning spells failure, if not utter ruin. Hence when you start a business of any magnitude you must have live wire salesmen and to get them you must know how to pick them.

Live Wire versus Jim Crow Salesmen. That you may not become sulphated in the bath of your own inexperience, let's see before we go any further just why an aggressive selling force is absolutely necessary to any kind of a business organization, but most of all to a new firm, especially if it is trying to market an untried product.

An experienced salesman for a new firm will not only succeed in selling its product to the best advantage and fullest measure but he will do even more, and that is to keep friends with his old customers and to make friends of his new customers. It takes only half-an-eye to see that the cordial relations he establishes with his customers is of the greatest value to you, for as long as he stays with your firm his customers will always be buyers of your products.

So strong is the tie that binds the salesman and his customers that the heads of a firm bank on it that when a salesman goes over to a rival concern his customers will stick to him and, of course, this means that they will buy of the firm he represents. This is simply because they like and believe in the salesman—not altogether good business logic perhaps but just another manifestation of human nature

Diametrically opposed, an *nth* rate salesman will not be able to hold your trade, even if he manages to transact some small business for you, and this may be due to any one of a number of reasons.

Thus he may understand the importance of

establishing friendly relations with his customers but he hasn't the happy faculty for doing so, and what is worse, he is quite as likely as not to make his customers dislike him. When this reaches a certain critical point they are apt to conceive a dislike for your goods.

From this you will gather that unless you employ the right kind of salesmen in the beginning of your endeavors you might as well close up shop, for this kind of denatured salesmanship will cause you untold worry and more financial loss than you can stand.

Varieties of Salesmen. Generically speaking there are only two kinds of salesmen and these are (1) the *fixed* salesmen and (2) the *traveling* salesmen. All salesmen who sell goods of whatever kind in shops and stores, at retail or wholesale, come under the first classification. The second class includes those salesmen who travel from place to place whether they are house to house canvassers, or salesmen who cover a certain prescribed territory of the country in the interest of big business.

Now what we are going to tell you about

salesmen holds equally good for either of the above kinds and in judging and selecting them it will be to your eternal profit to heed the advice of a couple of old timers who have gone through the mill and know the ropes.

The Qualities of a High-Grade Salesman. There are two things that you must look after in taking on salesmen and these are (1) his *personal appearance* and (2) his *personality;* naturally the first has to do with his physical aspect and the second is chiefly a matter of his mental attributes. Without these two prime factors expanded to a proper degree a man is not likely to be the salesman he thinks he is and you wish he was.

On Personal Appearance. Much depends on the personal appearance of a salesman and on other outward signs that loom up which seem to indicate the solidarity of the house he represents. Here again must the peculiarities of human nature be taken into consideration.

When a customer has before him the visual evidence that all is right, and at its best, it puts him in a favorable frame of mind and conversely, when things do not have the right look he jumps at conclusions as before and he has an

uncomfortable feeling. The personal appearance of the salesman, then, goes to make a good impression on or else it grates on the nerves of the customer, and so small a matter as this may either make or break a sale.

The personal appearance of a salesman can be divided into two parts and these are (1) his *wearing apparel* and (2) his *physical characteristics*.

About Wearing Apparel. To lay down a hard and fast set of clothing specifications for a salesman would certainly be a man's job but in any event his dress must be in good form. By this we mean that a salesman for a maker of men's clothes or a suit and cloak house can afford to look like a fashion plate, if he wants to, for this style of dress would be in keeping with his business at least. In this case his clothes would impress some of his customers with the idea that the goods he sold them would likewise be up to date.

But you can see that such an outfit for a salesman of farm tractors would be entirely out of place and a farmer would quite naturally conclude that a "gol dern dude" like him couldn't know anything about machinery. If

a salesman feels that he wants to dress the part he must use mighty good judgment or he will make a grand fiasco of his whole effort.

There are, however, some hard and fast rules about the way a salesman should dress. First, his clothes must always be good, neat, and well-fitting and his linen immaculately clean. Second, he ought to look prosperous but never flashy because trick clothes carry with them the suggestion that he is a lightweight. Some salesmen try to cover up mediocrity with loud clothes and hence this style is also tabooed.

But don't lose sight of the fact that the salesman himself must be entirely satisfied with his own personal appearance, for no man can sell goods if there lurks within him the idea that he is not dressed right.

Now about salesmen who wear jewelry. Many sales managers do not advocate the wearing of jewelry, but here again a little common sense will clear up the issue. As long as jewelry is worn that does not offend good taste it will not stand in the way of a sale, and if it inspires self-confidence in the salesman it will prove an aid to him. An ex-

cess of jewelry, however good, always creates a bad impression in the mind of the solid customer as it suggests the confidence man.

Facial Characteristics. There are some salesmen who have not a naturally pleasing facial expression. If a man's face looks as if he was soured on the world he can't hope to compete with men who are always genial. The trouble with a lot of salesmen is that they take themselves too seriously and if they are fairly good they think that neither the firm nor their customers can get along without them. A cheerful expression can be acquired by anyone if he starts in early enough, so tell your salesmen to begin to look pleasant *now*. The physical and mental qualities are shown diagramatically in Fig 7.

A Vigorous Personality. There are three elements which when combined make up a potential personality and these are (1) *physical health*, (2) *mental vigor*, and (3) *moral fiber*. Of these the first two are the most important to the salesman although the third must be duly considered.

Your Physical Body. You have probably noticed that big men, that is men with beef-

on-their-bones, are usually good salesmen and this is especially true if they have anything like proportionately big minds.

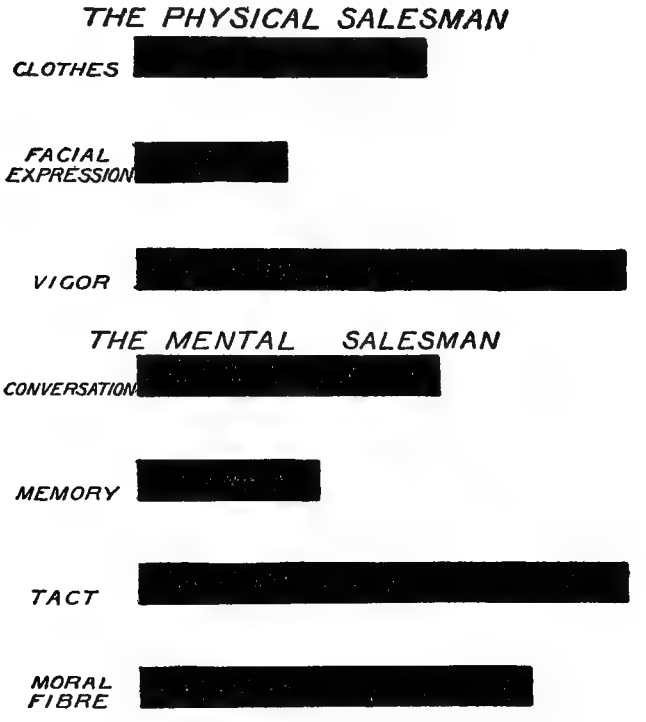

Fig. 7.—The Make-up of a Live Wire Salesman.

Men who are physically large have, as a rule, what is frequently called *personal magnetism*, that is they attract other men to them. As a matter of precise science there is no such thing

as personal magnetism, that is magnetic lines of force are not set up and radiated by the human body as they are by an iron or a steel magnet nor has it ever been shown that a magnetic field has the slightest effect on living matter.

Don't, then, as you value your time and money, waste either on literature that purports to teach you personal magnetism, animal magnetism, mesmerism, hypnotism, or anything else that is neither science nor business.

In physics, however, there is an attraction between all bodies, or *mass attraction* as it is called, that is a gravitational force which is exerted between bodies, and a large body has a greater attraction for a small body than the latter has for it, and so draws it to it; hence large men exert a mass attraction for small men.

As an example a well-known corset manufacturer of small stature discovered that although he built good corsets his customers did not like him, his personality was *nil*. He was shrewd enough to guess that sales were lost when he was merely present, and frequently because he met and talked with his customers.

He thought long and hard about his steadily

declining business and he decided to put a new policy into effect. First he got together an executive and selling force of large men and then he himself disappeared from the sight of his customers. Soon after his sales began to increase and he is still doing business at the old stand. This tale sounds like fiction but it is gospel truth and you will do well to take cognizance of the moral it carries.

Your Mental Self. What is of far more importance than mass attraction is an alert, quick, and vigorous mind and this in the final analysis is the essential feature in the making of a successful salesman. You can overcome bodily bulk by sheer mentality but you can't overcome the power of the mind by putting mere mass against it.

But if a salesman is handicapped physically by his small size he must counterbalance it by the force of his mental vigor. Now there are three chief things that have to do with a man's mind in so far as his ability to sell goods is concerned and these are (1) *conversation*, (2) *tact*, and (3) *memory*.

Conversation. To be a convincing talker a salesman must be a good thinker, grasp new

ideas quickly, and enlarge upon them, and he must have a fair vocabulary, that is a stock of words.

Flowery words are all right for a poet but they are of no value to a man who is trying to impress a customer with the worth of his goods. Good, snappy, vigorous words that indicate power, work, speed, sales, money, success, etc., are the kind that catch and hold the attention and interest of the customer—words that he can visualize, that is, get a mental picture of, and which look like dollars to him.

To be original is a very great asset for a salesman for it is that faculty which enables him to be aggressive. It consists of an inventive and executive ability by which he can overcome the difficulties that crop out in the course of a selling talk. A good talker not only has a strong selling vocabulary but his voice acts as a resonator and amplifies what he says. To have this quality a voice must be clear and strong, not necessarily musical, but good to listen to.

A salesman who will practice fifteen minutes a day—thirty is better—putting forth his selling talk either in his room or out in the

woods; taking care to pronounce his words distinctly and correctly and to use a pleasing tone, will soon be able to express his thoughts in smooth, vigorous language, and in an easy style which will go a long way toward selling your goods.

Using Tact. The matter of using tact is not so easy to learn but it can be done. There are two kinds of tact and these are (1) *near tact* and (2) *real tact*. Tact has been defined as *nice discernment* but when applied to salesmanship it means the art of saying what you want to say to a customer without aggravating him.

Near tact is the kind that most salesmen have; it consists of enough discernment on the part of the salesman to realize when his statements are being received unfavorably by the customer, and sufficient intelligence to switch over to a more pleasing line of talk.

Real tact consists of sufficient discernment never to say anything to which a customer can take exception, and it is a rare and valuable trait. We say *trait* but after all *habit* would be the better word, for tact is largely a matter of getting into the habit of saying the right thing

at the right time. Naturally the best salesmen are those who have the most tact.

Good Memory. Memory is another important factor in determining the efficiency of a salesman. Memory can be divided into two parts from a salesman's standpoint and these are (1) a memory for faces and names, and (2) a memory for words, phrases, and selling points.

To have a good memory for faces and names is an essential part of a salesman's mental equipment. It is obvious that he must be able to recall instantly at any time and place the name of a customer he has once met. There is nothing that a customer likes better than to be recognized instantly by a salesman and called by his right name. It pleases his vanity for it places him on an imaginary pedestal of near-greatness with the great.

Of course a salesman must remember all of the important data and selling points about his goods and the interesting processes in their manufacture. All this is easy enough for most salesmen but where lots of them get hard pressed is in not being able to keep the continuity of thought intact as they push along through the various selling stages.

The way to circumvent this kind of an erratic memory is to have a cut and dried outline of the selling talk and to get it down pat so that when a customer breaks in with a little talk of his own the salesman can reply and then go on and pick up the thread of his discourse at the exact point where he dropped it.

His Moral Fiber. To be a continuous successful seller a man's moral fiber must be as tough as they make 'em. He must be as straight as a die and must pursue an unswerving course of honesty in dealing with his customers. To do this he has got to come pretty nearly being what is commonly called a *white man* not only in his business life but in his social life as well.

Sticktoitiveness is another crowning quality that is included in the term moral fiber and many salesmen, who have little real selling ability, hold their own against those of more ability because they possess an overabundance of this sterling-qualification.

In football it is this force that keeps a man bucking the line when the game is lost and he is fagged out, only in football they call it *guts*, whereas its real name is moral tenacity.

Picking Live Wire Salesmen. All through this chapter we have been citing the qualities you must look for in live wire salesmen and if you are young in the business you can take a hint and embrace them yourself.

To pick a live one from a bunch of applicants, don't do it on first sight or on the strength of a letter a salesman writes you. On first sight it is possible to miss some of the sterling qualities for which his tribe is noted—that is if he has any. As for a letter he writes you, it may be that he can express himself far better on paper than he can by word of mouth, or he may get a stenographer to write it for him.

The best plan is to give each of the more promising applicants all of the literature and such selling data as you have on your product, tell him to take it home with him and to come back the next day. One by one they will present their different ideas for selling your goods and, knowing them so well yourself, you will have very little trouble in picking the live-wires from the dead ones. Your live-wire will have a smooth and easy bearing, a vigor of speech, and an abundance of selling points that

distinguish him at once from both the novice and the old-timer of mediocrity.

By using this method you can weed out the inefficient salesmen and secure those who will handle your product to the best possible advantage.

CHAPTER IV

SELLING OVER THE COUNTER

Selling over the Counter *versus* on the Road—How to Sell over the Counter—How to Arouse Curiosity—Why an Attractive Display Must be Used—Various Kinds of Display—Why Live-Wire Salesmen are Necessary—Kinds of Customers—The First Kind—The Second Kind—The Third Kind—Making a Sale over the Counter—The Counter Salesman and His Stock—Arranging and Systematizing Stock—How to Organize a Sales Force.

As you have seen, the foregoing chapters of this book cover basic principles that have to do with salesmanship in general, and consequently the principles put forth hold good equally for automobile, life insurance, or any other kind of salesmanship, and hence, they also apply to selling over the counter.

For instance in the first chapter we gave you the five simple elements needed to make a sale and these are also steps in counter selling, except that in the latter case some of them are greatly abridged and abetted because of the fact that it is the customer who approaches the salesman—and usually with the desire to

buy already in his mind—and not the salesman who approaches the customer as in most other kinds of selling transactions.

Also in the matter of dress and personality all that we have said in the chapter on *How to Pick Live Wire Salesmen* is just as true in the matter of choosing counter salesmen, and finally, in Chapter II, the fundamental principles for the organization of a master selling force are laid down.

From this you will see that by a careful study of the first three chapters you will have at your finger's ends the ground rules of success for any kind of selling and salesmanship in general, and, it follows, for selling over the counter. There is more, however, to successful counter selling than the cardinal principles involved and it is intended in this chapter to bring out many of the other big and little points.

Of course in the last analysis the salesman himself is of the most importance, but his importance is much less than that of the traveling salesman to his firm, as you will presently see.

Selling Over the Counter versus on the Road. The reason the counter salesman does

not measure up in importance to the traveling salesman is that it is much easier to sell over a counter than to sell on the road. Therefore it is unnecessary for retail stores to employ such high grade salesmen as those employed by firms who send them on the road.

Do not understand this to be an odious comparison or intended to depreciate the value of the counter salesman or, further, to insinuate that he can be any the less skilled in his branch of the art than the traveling salesman, but what we intend to imply is that his branch is one that does not require as much skill and tact as that branch his traveling brother is engaged in.

To make this point clearer, if you are a traveling salesman you often have to deal with men who at the start have no idea of buying and it is your part of the game to set up in the minds of such men the desire to buy your goods. In order to do this you must cleverly go through the five basic steps in making a sale and everything depends on your initiative and skill.

How to Sell over the Counter. But when a customer goes into the store and up to the

counter the great need for initiative is much less on your part, assuming now that you are the counter salesman.

Two reasons can be cited for this and these are: (1) the customer approaches the salesman, thereby taking upon his own shoulders the burden of initiative and so causing the introduction to be gone through with quickly and more or less mechanically, and (2) in the majority of cases the customer has a definite idea of making a purchase before he enters the store. In other words the customer's attention, interest, and desire are aroused beforehand, often through the medium of advertising matter, store display, or hearsay, and this, sometimes, to a very considerable degree.

Upon the extent to which these things exist in the customer's mind depends the amount of initiative and skill needed by the salesman to change the resolve to buy into action. Obviously if attention, interest, and desire are well advanced, then it requires but a mere superficial display of the goods by the salesman to make the customer buy, for the resolve to act is in reality subconsciously planted in his mind.

On the other hand if these steps are not so well developed, then his attention and interest are the result of idle curiosity and as yet there is no resolve to buy. Incidentally we may mention something which everybody knows, that, with women customers, curiosity plays a much greater part than with men.

To differentiate between these phases of the customer's mental states, a counter salesman must know the principles of selling if he is to sell to all comers; and unless curiosity can be nursed along into a well formed and definite resolve to buy, the sale is lost.

A cursory display of goods is not always enough to lead curiosity into desire and thence into buying action. Curiosity however is one of the most helpful aids to salesmanship and for a salesman to lose a sale where the customer already has it is nothing short of a crime.

How to Arouse Curiosity. There are several ways by which it is possible to arouse curiosity and its logical sequences, of desire and buying action. The first and foremost of these is by advertising. The second is by means of display and this, according to lexicographers, means to spread out, unfold, or exhibit. In

selling parlance, however, it means to show goods in an *attractive* and *favorable* manner to the public gaze.

Why an Attractive Display Must be Used. There are two chief kinds of display used in retail stores. These are (1) the window display and (2) the counter display.

Both kinds have dual purposes and these are (*a*) to augment the advertising the store does and (*b*) to awaken dormant curiosity and to arouse stagnant interest when advertising has failed for one reason or another.

Thus when you read in the morning paper about a suit, of its style, of its quality, or of its low price, or of all these things rolled into one, there is awakened in you a sufficient interest to cause you to go to the store and see it.

This interest consists chiefly of a desire to merely take a look at the suit and perhaps examine it at close range and so discover for yourself if it is as the advertisement claimed it to be or not. When you reach the store the window display satisfies your desire to see the suit but it does not satisfy your desire to examine it closely; but what it does do is to *intensify* your interest in it.

On reading the advertisement and looking at the picture accompanying it you visualized the suit in your mind's eye, and now the window display materializes it for you in the concrete. You have actually seen the suit and yet because the plate-glass window intervenes between you and it you have been baffled in your desire to examine it closely.

Your natural tenacity of purpose will next induce you to go into the store and to that part of it where you can examine the suit at first hand. There you are confronted by a suit on a tailor's dummy or perhaps a counter display. The purpose of this display is either to (1) further stimulate the interest created by the window display, or (2) to create interest in those who failed to see the window display.

In counter display the goods are exhibited in various pleasing and interesting ways, thus building up new ideas in the customer's mind and giving new cause for interest. Hence by the time the customer is shown the goods by the salesman these clever displays will have turned his curiosity and interest into the desire to own and it only remains for the salesman to induce the buying action.

The second purpose that displays serve is to interest the passer-by. You must have often observed that when you pass by a clever window display you are attracted by some article or piece of goods, and you were almost unconsciously led inside the store. Once there, a salesman took you under his wing and carried you through all the selling steps until you finally bought—and all because of the initial interest awakened in you by the display. The diagram in Fig. 8 shows the idea.

Various Kinds of Display. To properly display goods is an art in itself and one which requires both genius and experience. Now there are four chief things that a display must do and these are (1) to please the prospective customer's sense of the artistic; (2) to arouse his interest; (3) to appeal to his discernment of quality or merit and utility; and (4) to challenge his judgment of values.

The successful window dresser usually combines all of these elements in his work, laying stress on the particular one which is in keeping with the class of customers the store has to deal with and which will be described later on.

If you are running a small retail store and

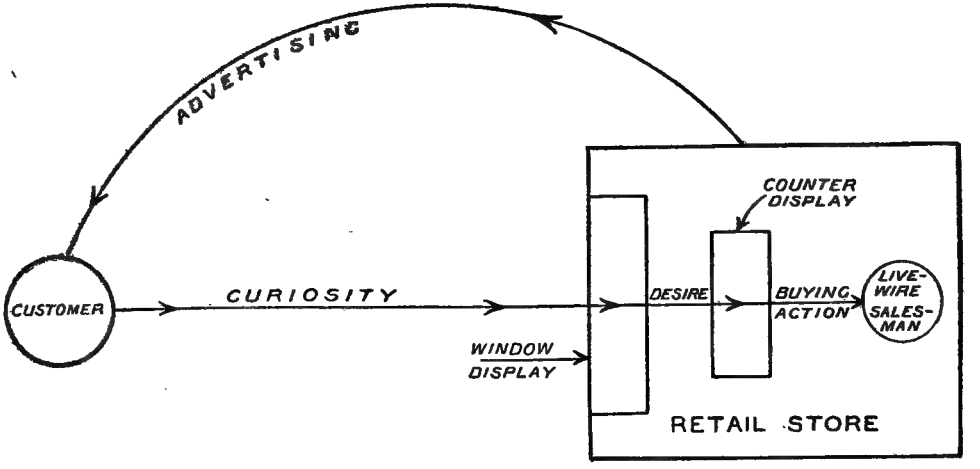

FIG. 8—THE MERCHANTS' SELLING AIDS

you will take the foregoing points into consideration you will be able to do your own display work, providing you have a little natural ability along this line. But if you find it to your advantage to employ a good display artist, he will get results that you would have difficulty in obtaining yourself, for this is the day of specialization.

Why Live Wire Salesmen Are Necessary. The counter salesman must be a *live wire* just as much as the traveling salesman. The appearance and personality of the salesman must measure up to the standards set in Chapter III. He must have a certain amount of initiative, tact, and sticktoitiveness if he is to make the maximum number of sales.

For now even though the customer's mind be bent on the purchase of a given commodity, if the salesman does not possess all the qualities of his traveling brother there will be, more than likely, a hitch somewhere between the time the customer meets the salesman and the time when he *should* resolve to buy and pay the purchase price.

Then again every customer must be handled a little differently for there are (*a*) some in

whom the resolve to buy is already fixed; (*b*) others in whom there is only the desire to own; and (*c*) still others in whom curiosity alone exists. The clever salesman determines almost the instant he comes in contact with a customer just which of these three cases he has to deal with and he acts accordingly, with the result that he sells to all of them.

On the other hand the poor salesman makes no distinction whatever between them but treats all comers and all cases exactly the same, and he loses two out of every three possible sales. As the matter of sales is a vital one let's take three different customers approaching a counter salesman and, further, let's take it for granted that each represents one of the cases above described.

Kinds of Customers. The First Kind. The customer who has resolved to buy goes to the counter without any hesitancy and asks to be shown the article he wants. He may ask a few questions as to its size, style, quality, or usefulness but because he has made up his mind to buy it he will not be likely to mention the price.

The Second Kind. Now let us consider the

second case, namely, that of the customer who desires to own the article but has not yet resolved to buy it. He walks up to the counter and his first questions will usually be based upon the points that are still doubtful in his mind, that is to say, if the price is the great object with him he will immediately begin to talk price, whereas if quality is his weak spot he will open fire on quality.

It is a little harder for the salesman to sell to this customer than to one of the first kind because he must create in him the resolve to buy. To do this he has only to meet the customer's questions as to price or quality in such a way as to satisfy him. From this time on the closing of the sale is the same as in the first case.

The Third Kind. Comes now the case of the merely curious customer who indifferently approaches the salesman. He is the hardest of all to sell to, for the salesman must lead the customer from mere curiosity to an intense interest, then the desire to own, and finally, the resolve to buy.

As before the salesman will take his cue from the nature of the questions asked and

having once found the point of the article on which the customer's interest centers he will bend all his energy to convince him that the article under discussion fulfills his requirements in every way. Fig. 9 shows diagrammatically the three kinds of customers to whom you have to sell over the counter.

With customers who are idly curious the hardest part of a salesman's task is to find a point in the article that will really interest the customer. The following story points out what we mean by the term *idly curious*.

A lady went into a large dry-goods store and asked the salesman to show her some silk dress patterns. He took down several bolts and expatiated on their numerous merits but could not get her interest, or *point of contact*, as it is sometimes called.

Believing that if he found the right pattern he could substitute interest in her mind for mere curiosity, he took down bolt after bolt until but a single one remained on the top shelf. Then the kind lady gently informed him that she didn't want to buy a silk dress pattern that morning anyway as she was only looking for her friend Mrs. Green.

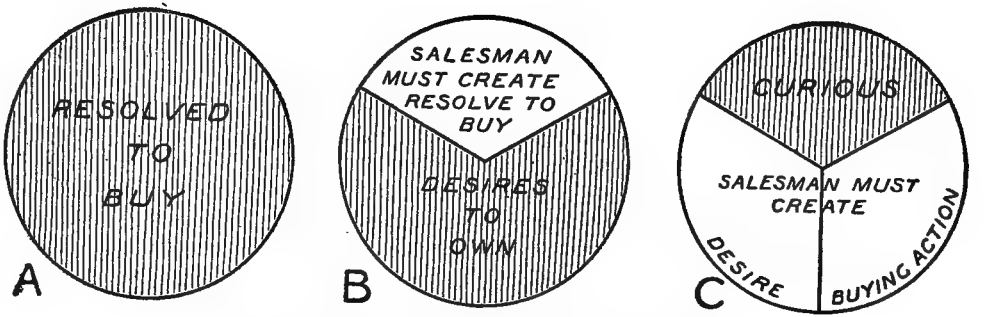

FIG. 9—THREE KINDS OF RETAIL CUSTOMERS

"Well, madam," replied the discouraged salesman, "if you think your friend is in that last bolt up there I'll willingly take it down for you." Obviously he had missed the point of contact.

Finding the point of contact is the keynote of success in selling not only to the merely curious but to the wholly disinterested customer, and often to the antagonistic person who has absolutely no intention of buying. In the next chapter you will find a fuller explanation of the point of contact and its relation to successful selling.

From what has gone before you can see the necessity of live-wire salesmen in your retail store. Of course, in a large department store where an army of salesmen are employed it is next to impossible to have every salesman a top-notcher. Inexperienced salesmen must be hired to keep the selling force up to the requisite number.

But even under these adverse circumstances the selling heads realizing the importance of having every salesman a live wire, will see that each one employed is given instruction in selling and in this way the whole force will in

time be selling according to the scientific principles of salesmanship.

Making a Sale over the Counter. As we have mentioned before, your customer is in one of three mental states when the salesman meets him. To the customer who has resolved to buy, the price of the article is of small interest as he has resolved to buy, and, hence, to pay the price. It is a waste of time for the salesman to enter into a discussion about the price, and if he does, it may even make him lose the sale.

If, however, the customer has only a desire to own the article then there are three things that will be of interest to him and these depend on what kind of a buyer he is. These are (1) those who examine the suitability of the article; (2) those who buy with the price alone in mind; and (3) those who combine both of these ideas in their buying.

The first class are usually those who have plenty of money and price does not concern them. The second class may or may not have money but either their dispositions make them close buyers, or necessity drives them to it. The third class, likewise, may or may not have

money but they form the larger part of those who buy logically, that is, with an eye to worth balanced against price. They are the sane buyers and it is easy to sell to them.

The salesman then must be able to tell to which class the buyer belongs, and to adjust his selling talk accordingly. For those in the first class he will base his talk upon the interesting points and the suitability of the article to his needs and leave out all mention of price or value.

With the second class he will work on their desire to get something really good for very little money. He points out why the cheap article is just as serviceable as the more expensive one.

With the third class the salesman will base his talk upon the fact that no better article can be bought at any price, in other words that the article he is selling them is worth the price he is asking for it. These are the three chief things a counter salesman must know and be able to use in order to be classed as a first-rate salesman.

The Counter Salesman and His Stock. It goes without saying that the counter sales-

man must know his stock thoroughly. Specifically he should know:

(1) Its purpose or what it is used for, as without this knowledge he cannot hope to converse intelligently about it.

(2) Its principal parts, that is, the things essential to its operation or manufacture, for these things are interesting to the customer of an analytical turn of mind.

(3) Its style or design, and how it is styled or designed to meet the needs of the customer.

(4) Its make and why it is better than any other make, if indeed it is.

(5) Its finish or effect, and this consists of knowing how the article as a whole is finished and how it looks.

(6) Its history or sentimental value; as a sample take the sale of antiques and oil paintings, in which line the whole of the salesman's talk must be based on the history, or sentimental value of the articles he is selling.

And finally (7), the price of the article in relation to its economic value and the effect of both of these on the customer.

Arranging and Systematizing Stock. In every line of business the stock must be ar-

ranged and systematized so that it can be handled quickly and safely. Especially in selling over the counter this is a very essential feature. Few customers indeed will wait for a salesman to hunt through his stock for an article, and many a sale has been lost simply for the want of a little system.

The initial cost of adequate shelving, drawers, counters, and showcases is a good deal, but such an equipment is amply paid for in the saving of time, room, and goods, and the sales it promotes.

Essentials of Stock Disposition. There are three essentials in the disposition of stock in a store and these are: (1) the ease and rapidity of handling it, and this, of course, includes accessibility; (2) safety, and this includes cleanliness; and (3) visibility, that is, it is arranged so the customer can see it.

Whether cleanliness is next to godliness or not depends largely on the personal viewpoint but in counter selling it must be had at all cost. No matter how fine the goods are, how strong the customer's desire to buy, or how good the salesman, if the articles are dusty, dirty, or faded he can get only shop-worn

prices for them, if indeed he can sell them at all.

How to Organize a Sales Force. To organize a sales force follow the instructions given in Chapter II. In the retail store the aisle managers are the sales managers of the aisle forces. You must have aisle managers not only because of their ability to oversee and direct the selling efforts of the force under them but because every aisle must have a responsible head who can be relied upon.

In large department stores the salesmen are under the supervision of the aisle managers, the aisle managers under the floor managers, the floor managers under the department heads, while the department heads are under the supervision of the sales manager.

CHAPTER V

SELLING TO THE RETAIL TRADE

How to Interest the Buyer—About the Point of Contact—What the Salesman Must Know—On Selling to the Retailer—The Art of Making Repeat Sales—On Making Hurry-Hurry Sales—Letting your Advertising Sell the Retailers' Goods.

WHATEVER kind of a merchandising business you may have there are four general outlets for your product. These are (1) to sell to the customer direct by means of house to house canvassers, or through stores or agencies of your own; (2) to sell to the retailer by means of traveling salesmen; (3) to sell to the wholesaler direct, by traveling salesmen or through a commission house; and (4) to sell to the general public, which consists chiefly of the consumer, through the mails. These schemes are pictured in Fig. 10.

It stands to reason that within certain limits, the larger the quantity of your product that you can sell at one time the lower the price you can sell it for. This is easy to see

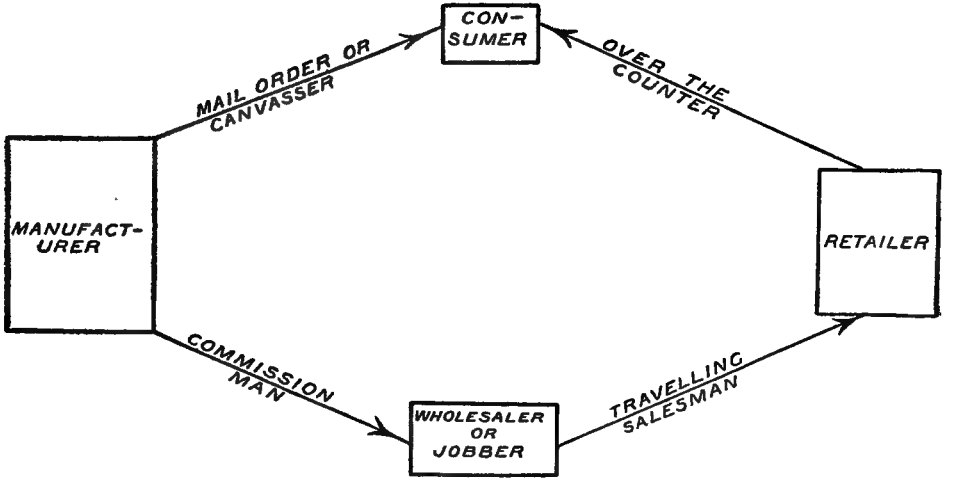

FIG. 10—THE BIG DIAMOND OF THE SELLING GAME

through for the larger the quantity of goods you manufacture the lower will be the cost of production on each lot.

Now since you can sell to the retailer a much larger quantity of your product than you can sell to a single consumer you can afford to quote him a lower pro rata price, for where you would have to pay twenty-five salesmen to sell one thousand articles to the consumer direct, you have to pay only one salesman to sell the same number to the retailer.

Nearly all large retailers employ what are known as *buyers* to do their buying for them and you will find the reason for this explained in Chapters IX and X. The proprietors of most of the small retail stores act in the capacity of buyers themselves.

Usually the buyer is a salaried man just as a counter salesman is and since it is his business to buy, your salesman should have no trouble in selling to him provided that he can interest the buyer in your product and convince him that his house can dispose of it easily, quickly, and profitably.

How to Interest the Buyer. The first move

to make then is to interest the buyer in what you have to sell and the way to do this is to establish friendly relations with him at your first meeting. When you have once done this you will have a clear track for selling him then and for all time thereafter.

Now there are three chief features that make for successful selling to a buyer and these are (1) a good article at a low price; (2) a strong selling talk; and (3) a winning and forceful personality. There is, however, one other feature, that, however foreign it may seem to selling and buying, still plays an important part in promoting sales and this is *entertainment.*

By *entertainment* we mean that part of it which has to do with the inner body, namely, good food and plenty of it. A man or woman buyer is never in so receptive a state of mind as immediately after a good meal. There is no psychology in this scheme of selling, but just vulgar physiology.

After a good meal the buyer will feel at peace with you, himself, and the world in general. Again you will find that dining with a buyer often puts you on a very friendly

footing with him which you could not obtain in months by ordinary business transactions, and moreover you yourself will be at your very best.

It is not so long ago that firms employed entertainers who were not salesmen at all but whose sole business it was to show an out-of-town buyer a good time. After taking the buyer to a rattling burlesque show and filling him up with liquids that are now *passé*, he would be turned over to a sane and sober salesman who would get him to sign up for anything at any price.

But all this sort of untoward thing has, fortunately, gone out of date. The buyer of to-day is apt to be wary of the salesman who entertains him lavishly, so don't overshoot the mark. The modern buyer is taking only two factors into consideration and these are price and quality. In fact he has got to do so in order to hold down his job.

About the Point of Contact. Dining with the buyer, however, provides one of the easiest and most plausible means for finding the point of contact. As we explained in the preceding chapter the point of contact is simply an in-

teresting point by which the salesman is able to catch the buyer's attention and keep his mind fixed upon it until he has made the sale. Usually a point of contact can be found in the goods you are selling but there are cases where it is only to be gained through an entirely different channel.

We also said in the first chapter that it is not a good scheme to direct attention to something else other than the article you are selling, but there are instances, especially when you meet your buyer under adverse conditions, when a little leeway from this hard and fast stick-to-business principle will, after everything else has failed, get you an order.

Nearly everyone appreciates a good joke and this has from time immemorial been one of the commonest points of contact. There was a time when a drummer who did not carry a full line of jokes in the back of his head was considered a failure. On the other hand the jocular point of contact has been worked to death and to-day it does not find nearly so unanimous a response in the buyer as it did in the days back there. Still it has a place and

may serve you well at times, if you do not impose upon it.

But there are other means of securing a point of contact and, indeed, these are so varied and numerous they are limited only by a salesman's ingenuity. The following illustrates the point at issue. The sales manager of the largest cash register concern in the United States discovered a prospect in a large and prosperous dry-goods firm at the head of which was a shrewd, hard-headed old Scotchman who did his own buying.

Being extremely desirous of placing his machines with this particular firm, the sales manager sent his best salesman to see the prospect with instructions to spare no time or expense in making the sale. The salesman wined and dined the canny old Scotchman who, although he good-naturedly accepted the entertainment, refused to be brought to the buying action. Then one morning a week later the salesman walked into the sales manager's office with a rueful countenance, a *mountaineous*—Kipling's word, not ours—expense account and the sad news that the prospect was impossible.

Having risen to his position as sales manager in virtue of his initiative he—the sales manager—so the story goes, determined to visit Old Ironsides himself. After a few minutes talk with his prospect he found him to be a second Gibraltar. The sales manager could not find a point of contact on which to hang a sale.

The sales manager was about to give it up as a bad job when a happy inspiration struck him. On the wall he saw a large salmon-trout mounted on a plaque. He approached it with all the awe, reverence, and enthusiasm of an old sportsman. For an hour and a half he talked fish, baits, equipment, and lakes with Angus McCollins. He had found the point of contact and the result was that the old gentleman invited him out to lunch and ended by placing a heavy order with him.

Later when telling some of his friends about it the sales manager admitted that he had never caught a fish—that is of the aquatic kind—in his life. But because of his discernment he had been able to find and to establish a point of contact where his salesmen had failed. He had penetrated through the hard-

shelled exterior of the man and sold him. Get the point?

What a Salesman Must Know. Before selling to the buyer there are several things that the salesman must find out and consider them fully if he hopes to have a permanent outlet for his product. Named these are (1) the size of the buyer's present stock, (2) his greatest possible outlet, (3) the terms that he will buy on, and (4) the terms that you can make him.

If it is possible for the salesman to determine these four things before he interviews the buyer it will give him a selling leverage of no mean power. By the size of the buyer's present stock we mean the quantity of like competitive articles he has on hand. Thus if the salesman is selling coal ranges he ought to know the number of coal ranges of other makes the buyer has on hand.

The retailer's maximum output is based on several things, chief of which is (1) the volume of trade he has, (2) the class of people he caters to, (3) the amount of advertising he does, and (4) the market for your line of goods. From this you will see that the retail dealer's output depends on (*a*) the amount of local advertising

he does and (*b*) the amount of national advertising your firm does, for it is these two things that popularize your goods with the public.

The terms on which the dealer will buy also depend on several factors the most important of which is (1) the price quoted to him by your competitors, (2) the class of trade he sells to, and (3) his present financial standing. And, finally, the terms on which you can afford to sell to him depend on (*a*) the cost of production of your goods, (*b*) the quantity that is taken by the retailer, and (*c*) your inside knowledge of his financial rating. How to get this line on him will be described in Part III Chapter X on *Inside Credit Information.*

Now let's see just how these factors affect the retail dealer's business and, consequently the sales you make him. In the matter of output regardless of the size of your retailer's trade there is a definite limit to the quantity of your product that he can sell in a given time.

Naturally a retailer with a large trade will be able to sell a larger quantity of your product than one with a small trade. If his trade is well-to-do or of the middle class the dealer

can handle higher-priced goods than a dealer can with a poor trade. In nearly all communities, however, the retail trade is made up of a mixture of both classes.

On Selling to the Retailer. Having taken all of the foregoing particulars into consideration you will have deduced the following facts about the retailer before you go to see him: (1) The approximate quantity of your product that you can sell him and that he can dispose of with certainty. (2) The terms that you must quote him in order to enable him to buy from you and still make his legitimate profit. This of course is determined from the quotations of your competitors and from the financial standing of the retailer. If money is tight your retailer will have to have time given to him in which to pay your firm and this may run from ten to ninety days. In any event it should be long enough to allow him to buy without involving him in pecuniary difficulties and especially is this true where you are opening a new account and where the retailer's credit is good.

(3) The terms that you can quote him and yet leave a safe working margin for your own

firm. This again depends on trade conditions and on his financial standing. When you have had him looked up by an accredited financial agency and you find he has an A 1 rating you can afford to extend liberal credit to him. On the contrary if he is on the ragged edge of bankruptcy you cannot, of course, afford to sell him on any other than a strictly cash basis.

So when you put up your selling talk to the buyer you will have determined all these things beforehand and settled them satisfactorily in your own mind. Then you will be able to lay before him a straight open and shut talk that will produce the results. Not to know these points is to buck the tiger blindly, and of course in such a game the odds are all against you.

The Art of Making Repeat Sales. To sell to a buyer once is not nearly as hard the first time as it is to repeat the sale and this is particularly true if there has been a hitch of any kind in the first transaction.

And it is self-evident that a salesman who can't sell twice to the same firm is a detriment to your business, for when enough customers

begin to feel dissatisfied the news will spread like wildfire through the medium of competing salesmen and shortly you will find yourself without a single good account.

The art of making repeat sales consists of but one thing and that is absolutely satisfying the buyer every time you sell him. If for any reason he thinks or feels that he has been deceived, you will find it pretty hard to sell to him the next time.

Agreed that it is a fine thing to make every sale a big one yet if you overstock your buyer, and this is often an easy thing to do, you will surely lose his confidence in your judgment, nay, even worse, he may doubt your integrity with the disastrous result that you will lose future sales.

The following fable carries its own moral. A young and exceedingly clever salesman—too clever in fact—went to the buyer of the Pottsville Hardware Company knowing full well that it would be impossible for the firm to sell more than fifty base-burners that season.

But because he was a clever salesman—too darned clever to tell the truth—he succeeded in unloading on the unsuspecting buyer 150

base-burners although even at the time the buyer was a trifle dubious as to their rapid turnover. In other words, he overstocked the buyer for all he was worth.

Six months later the salesman—he was wonderfully clever as we told you—called on the buyer again in his quest for a repeat order but the buyer had begun to realize that he was stuck. Another six months passed and the salesman—who, as we mentioned before, was too clever for utterance—returned only to be greeted with harsh words for the buyer knew that he had not only bought foolishly but he felt that the salesman—who was too clever to live (apologies to Kipling)—had made several kinds of a fool of him. And it follows, as the night the day, that the young salesman—who was not quite as clever as he thought he was—no longer calls on the buyer of the Pottsville Hardware Company.

That is why we say that the best policy is to find out first the largest reasonable output of your retailer and then sell him to that amount and no more. Overstocking him not only causes his embarrassment in the slow turn over of his capital but it takes up his space and

leaves him with shop-worn goods on his hands. It is far better to take smaller orders and make numerous repeat sales.

Another thing that frequently causes the loss of repeat sales is broken promises. The majority of these have to do with the delivery of the goods. Often a salesman of small caliber will perjure his soul to perdition if he can but close a sale. But when the goods fail to show up for ten or fifteen days, or perhaps longer, after the time scheduled, the buyer frequently and quite rightly decides that his orders in the future will go to another salesman and your house will be the loser.

Sometimes a salesman will promise the delivery of goods at a specified time and it will be delayed through no fault of his. When such a delay causes the buyer inconvenience it annoys him just the same but he will accept an explanation because he knows that neither the salesman nor the house he represents controls the transportation facilities. But never let him be able to charge you with anything worse.

On Making Hurry-Hurry Sales. Occasionally a salesman is able to and does make what is called a hurry-hurry sale. This is the way

it is done. He rushes madly into a buyer's office with his watch in his hand, tells him hoarsely he has to catch a train for Chicago in 8¾ minutes, puts his talk up to him in three minutes and gives him two minutes in which to buy.

Once in a while this subway scheme works out but as a rule the sale will turn out unsatisfactorily because buyers are not accustomed to making rapid-fire decisions and when they do they will not hold good on careful afterthought. Hence our advice is don't do it!

Letting Your Advertising Sell the Retailers' Goods. Nearly every manufacturer gets out circulars, booklets and other printed matter for advertising purposes. Where it is feasible to supply a retailer with such literature and when his name is either printed on it, or a blank space is left so that he can stamp his name on it, it is an invaluable aid to him in selling your product, and incidentally, to you in selling to him.

Literature of this character not only helps to localize the fame of your product but if it is done on a large enough scale it tends to nationalize it and this is of the greatest selling advantage.

CHAPTER VI

SELLING TO THE WHOLESALE TRADE

Salesmanship of a High Order—On Selling to the Jobber—Advantages of Selling to the Jobber—Quantity Production—Who Pays for the Cost of Production—The Lost Art of Making a Profit—How Sales are Made to the Jobber—How a Factor Works—The Value of Salesmanship in Selling to the Jobber—What Largeness of Vision Is—Selling Points that Appeal to the Jobber.

THERE is still one other phase of selling goods through the direct or personal efforts of salesmen that we have not touched on, and this is selling to the wholesale trade.

In the idiom of selling talk a jobber is considered as being one and the same as a wholesaler and these names are, therefore, very often used interchangeably for both jobbers and wholesalers buy in large quantities.

There is, however, this nice distinction between them, the wholesaler usually sells to the retailer while the jobber sometimes sells to the wholesaler and sometimes to the retailer. As far as what we have to say in this chapter

is conceived the difference is a mere technical detail and need not be considered.

Salesmanship of a High Order. The salesmanship involved in selling to the jobber is of the highest order and consequently it is more difficult than selling to the retail trade or over the counter to the consumer.

The chief reason for this is that larger sums of money are involved in the transaction. It is true in any business that the larger the quantity of goods that changes hands the larger the sum of money at stake and hence the greater is the vital interest of both the buyer and the seller.

On Selling to the Jobber. There are several things of especial concern in the selling of goods direct by the manufacturer to the wholesaler or jobber. First of all when the manufacturer sells to a jobber he must sell at a low enough price to enable the jobber, or wholesaler, and the retailer to make a legitimate profit and still not have to sell it at such a high price that the consumer will buy some competitive article.

The profits of the manufacturer must necessarily be less on each individual article sold when

he sells to the retailer or to the consumer direct through his selling force or through the mails.

But balanced against this is the fact that the jobber will take many more times the quantity of your product than you could possibly sell to the retailer who since his market is localized can only handle small lots. Selling in large quantities to the jobber is a great aid to a manufacturing business in any one of a number of ways, and among these are: (1) it enables you to go in for quantity production and (2) it relieves you of the expense and responsibility of maintaining a large selling force.

Advantages of Selling to the Jobber. Frequently a manufacturer is able to place his entire output up to the limit of his capacity with a jobber and when this is the fortunate state of affairs it relieves him of all the worry attendant upon the sale of his product. He is then able to devote all of his time, energy, and capital to the operation of his plant, he is able to buy the raw material he needs and manufacture the goods to a much better advantage than when he is bothered with the selling end of it too.

Because he can produce in large quantities, or quantity production as it is called, he can get the cost of production down to rock-bottom and this permits him to do one of two things, namely: (1) to make a larger profit

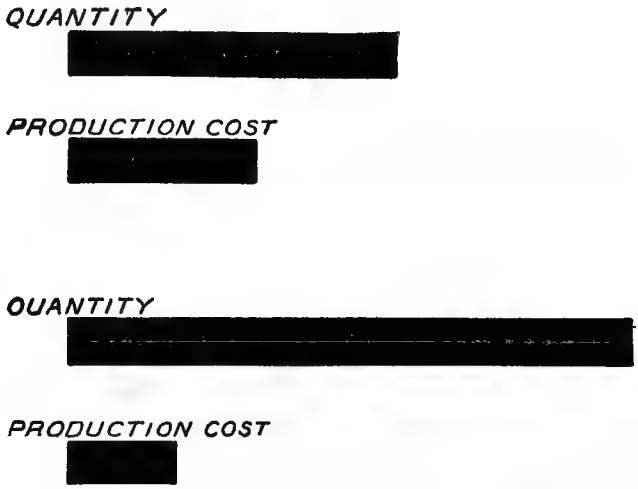

FIG. 11—HOW QUANTITY LOWERS THE PRODUCTION COST OF AN ARTICLE

when selling to the jobber than is made by his competitors, and this without raising the price of the article to the consumer, or (2) to sell a larger quantity in virtue of the price at which he can sell the jobber being lower, and this means that he can underbid his competitors. See Fig. 11.

Obviously these two gains are of the greatest value to the manufacturer, for while they are the logical outcome of quantity production they more than make up for the loss of a larger profit where the article is sold direct to the consumer, since the whole amount sold, and therefore the total profits made, are greater.

When the jobber has bought the product of a manufacturer in part or in whole he either (1) sends his salesmen on the road who sell it to the retailer, to the consumer, or to both, or (2), and what is more often done, he sells the goods to wholesalers who in turn sell to the retailer, who sells them to the consumer.

One of the selling schemes the jobber uses when he takes over the entire output of a manufacturer is to advertise the product and in this way he can secure a nation-wide sale for it. This, of course, helps the manufacturer for it nationalizes his product.

A further advantage the manufacturer has in selling to the jobber is that he can greatly reduce the size and hence the expense of maintaining an efficient selling force such as is needed by the jobber or wholesaler who sells to the retail trade.

Who Pays for the Cost of Production? One of the largest advertising agencies in the United States provides its employees with a series of educational and constructive lectures on merchandising. During one of these talks the question, "Who pays for advertising?" was asked. Simple as the question is, only one man was able to give the right answer, to wit, "The consumer, of course."

This answer is the keynote of all merchandising. The consumer must pay not only for the advertising but for all the costs of production and merchandising from the time the raw material is bought until the finished product is placed in his hands by the salesman. Fig. 12 shows what the consumer pays for when he buys.

It is the exceeding large force of highly trained men that is needed to sell the product from the time it is manufactured until the time the consumer gets it that boosts the price of it high-sky and makes the consumer breathe hard, and want to turn anarchist.

The fact that a manufacturer can eliminate the large and expensive selling force by disposing of his goods to the jobber, and that this

enables him to make the latter a much lower price than he could to individual retailers, does not in the least affect the price the consumer is called upon to pay. Thus it is that no

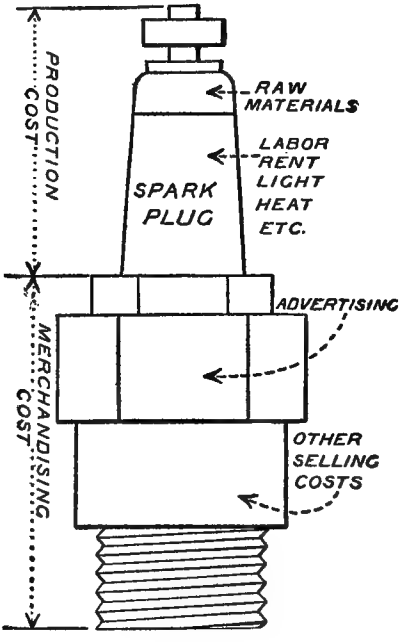

FIG. 12 —WHAT THE CONSUMER PAYS WHEN HE BUYS

matter what scheme or device is used by which a product is marketed there is a balance maintained in the selling expense so that the final price paid by the consumer does not vary greatly.

A still further reason why it is more profitable for a manufacturer to sell to the jobber or wholesaler than for him to sell to the retailer or to the consumer is because the former are specialists in selling. Their selling forces are as efficient as it is possible to make them and indeed they have to be if they are to sell at a profit.

It stands to reason then that they can handle your goods for you so that the final price made to the consumer will be lower than if you handled them yourself because your knowledge is restricted to manufacturing and does not therefore include selling. At least this is true of most manufacturers and there are mighty few men in the world who are universal geniuses.

The Lost Art of Making a Profit. Here is a word-cartoon that you'll appreciate. The firm of Jenkins Bros. and Company manufactured clothes-wringers for a long period of years. It kept no large selling force for it sold direct to big jobbers at low prices and what it lacked in profits on the sale of each wringer it made up in the quantity of wringers which it was able to manufacture and sell.

Working on this policy the firm prospered. A couple of years ago it changed hands and the new owners instituted a different policy. What they proposed to do was to sell direct to the consumer, cut out the profits made by the jobber and retailer, and secure larger profits for themselves.

After a year and a half of this sort of thing they woke up one morning facing a receivership, and not until then did they discover that they had lost the art of making a profit. Investigation proved that their selling force was a growing liability. The policy of the firm was forthwith changed back to selling to the jobber and once again the lost art of making a profit was rediscovered and the firm made money.

Don't think for a moment we mean to say that it is impossible for the manufacturer to sell direct to the consumer and still make a profit, but rather that it takes a lot of genius for a manufacturer to sell through the medium of direct and personal salesmanship because it involves a large and expensive selling force. The growing business of to-day is one that strives toward nationalization. The manu-

facturer-to-consumer through the personal salesmanship plan, *i.e.*, house to house canvassers, no longer lends itself to this scheme.

In the next chapter, on *Making Your Sales Through the Mails*, you will find the means that are now used by which the manufacturer can sell direct to the consumer and still make a profit, providing his product is adapted to the mail order business.

How Sales are Made to the Jobber. Now there are two ways by which a manufacturer usually sells his product to a jobber, and these are (1) by selling to him direct and (2) by selling to him through a commission man or house.

While we say that the manufacturer and the jobber get in touch with each other without the intermediary services of a third party, of course when it comes to the actual selling of the product to the jobber the manufacturer will have on his staff—often a member of the firm—a salesman of a high order who will carry on the negotiations, or the manufacturer himself can do the selling.

As we pointed out before there is a much larger sum of money involved in manufacturer-

to-jobber selling than in any other kind of sales transactions, and the salesman representing the former must be a top-notcher. His arguments must be backed up by statistics and he must have at his tongue's end all the varied data relating to his product.

The main and foremost things, then, that interest the jobber are (1) the quantity of the product that he can reasonably expect to dispose of in (2) a given time and (3) the profit he can make on the turn-over. It is up to the manufacturer's salesman to convince him that the article he is offering is a good and quick seller and that the profit he will realize is a fair one.

The second way open for the manufacturer to dispose of his products is through what is known as a commission man. This is the method most commonly used because it is the easiest. In this scheme the manufacturer and the commission man get together and the latter agrees to find a buyer for the former's product among the jobbing or wholesaling trade. In other words the commission man acts as the salesman and the only difference is he is a freelance, that is, he is not directly

affiliated with the manufacturer and he simply receives a certain percentage, or commission, on the sale when he makes it, instead of drawing a salary.

You will, as a rule, find that the commission man will render you better service than a salesman of your own, for it is his business to handle large transactions like yours and he is a specialist in selling to jobbers and wholesalers. His commissions are generally large but this is offset somewhat because he is able to dispose of your product more profitably than you can.

How a Factor Works. Another kind of commission man is called a *factor*, and the way he works is like this: He agrees to dispose of a certain output of the factory; his next step is to get a jobber who he is confident can sell the product but who lacks sufficient ready capital to enable him to buy the quantity of the product the manufacturer has to sell.

Or it may be the other way about and a jobber, having found a product he feels sure he can sell, will often call in a factor. In either case the factor will advance the jobber enough capital so that he can buy from the manufac-

turer. When the jobber has realized on the sale of the product he returns the factor's loan plus a commission. The latter depends on the risk the factor takes with his money in loaning it.

The Value of Salesmanship in Selling to the Jobber. No matter how the transaction between the manufacturer and the jobber is carried out salesmanship of a high order is needed. Even if the only parties concerned in the sale are the manufacturer and the jobber, the former must be or must have a No. 1 salesman in order to dispose of his goods to an advantage.

That he is selling huge quantities of his goods, and that large sums of money are involved, makes super-salesmanship a greater necessity than in any other kind of selling we have described. But the principles underlying manufacturing salesmanship are just the same as those which we have expounded before, though there is one thing which the manufacturer's salesman must possess in a degree far and above the counter salesman or even the traveling salesman, and this important essential is what is known as *largeness of vision*.

What Largeness of Vision Is. The manufacturer's salesman must be able to *think* big sales if he is to *make* big sales. Moreover since so much more is involved in deals of this kind than in ordinary everyday run of sales a slight error of ten means the loss of thousands of dollars. Hence the salesman's judgment must be next to infallible or he is liable to bankrupt his company and go broke himself—and this has happened too.

Once in a while even when he has a keen perception and full knowledge of market conditions some untoward circumstances may develop. Here is one firm's experience: The Gasco Carburetor Company secured a contract to supply the Addison Motor Car Company with carburetors—this was before we went to war—at rock-bottom prices. When the war broke out, brass, the alloy of which the metal parts of carburetors are made, came into great demand for munitions and as a result the price of brass soared skyward. Unfortunately the Gasco Company's supply of brass, which they had bought long before the outbreak of the war at a low price, ran out before the order was three quarters filled. The firm was forced

to buy the rest of the brass they needed at war prices and as a result the profits on the whole deal were eaten up on the last lap.

Selling Points that Appeal to the Jobber. Just as in selling to the consumer there are certain points which appeal to the jobber and which will sway him over to the buying side when they are presented to him properly.

In the first place you must consider that the jobber is a cold-blooded business man and therefore the elements we call human nature in the consumer are wanting in him and so you can't bank on them in your dealings with him. When the consumer buys he does so with the idea in mind that the article is to supply some need and this is a good substantial groundwork on which to base a selling talk.

With the jobber, however, this need of the product is eliminated in so far as it affects him personally. The sentimental value of the product does not concern him directly either. Summed up there are only three things that the jobber is interested in and to sell him your talk must satisfy him as to these hard and cold facts, namely; (1) that he can make a larger profit on your product; (2) that he can sell a

larger quantity; and (3) that he can sell your product faster than any other.

The first point means that you must sell him your product at a lower price than he can buy any other competitive article for and that your product will command as high a market price. The second point calls for a product of such quality that when sold at the same, or at even a little higher price, to the consumer, it will out-sell any competitive article.

Second, he must be convinced that the quality of your product is the best that his money can buy, otherwise he will not be able to compete with other jobbers who are selling a better article at the same or a lower price. Finally he wants to also be assured of the quantity which he can dispose of in a given time.

There are two sources for this information and these are (1) the market you have created by advertising and (2) the past performance shown by the sales of your product. You must be able to show him that there is as good, or a better, market created for your product as for any other of the same kind and that its sales in the past have been highly successful.

As to the third point this depends upon a combination of circumstances chief of which are a low price to the consumer in relation to other competitive articles, a better quality and a larger advertising appropriation by your manufacturing concern.

By bearing all of these points in mind as well as the points we have enumerated for good salesmanship in the first chapters of this book, you will be able to sell to the jobber or commission man. Also read with particular care what we have said in the chapters on *Expert Buying* for these will serve still further to throw light upon the varied turns of mind that you will find in the retailer and jobber and which you must be prepared to cope with in your selling talk.

Further, the chapters on *Credits* will prove of great value to you in deciding what terms you can best afford to sell your product on, and you should read these chapters on buying and credit with especial reference to the selling end of the game for, as you will presently see, buying is the reciprocal of selling.

CHAPTER VII

MAKING YOUR SALES THROUGH THE MAILS

Advantages of Selling through the Mails—On Securing Mailing Lists—Getting Prospects through Advertising—Getting Agents through the Mails—What Mail Order Correspondence Is—The Art of Sales Correspondence Writing—Kinds of Stationery and Printing—The Use of the Mimeograph—In Regard to Printing Letters—The Psychology of a Selling Letter—How to Put a Selling Punch in Your Letters—The Body of the Letter—About Follow-Up Letters—Enclosures with Letters—Long Letters *versus* Short Letters—Writing Collection Letters.

THERE is still another way of making sales that we have not described and this is by selling through the *mails*.

To recapitulate, you have seen that a manufacturer can sell by means of salesmen to the commission man, the jobber, the wholesaler, and the retailer and make a profit, but that selling direct to the consumer through salesmen is no longer highly profitable.

The mails, however, offer a loophole through which the manufacturer can sell to the general public direct without the intermediary of a selling force and still make a profit.

Advantages of Selling through the Mails. Now there are certain advantages to be gained in selling through the mails, chief of which is that it obviates the necessity of a large and expensive force of salesmen. Yet at the same time it permits the nationalization of an article or a product and this enables the manufacturer to reap the benefit of consumer prices, or if he does not want the benefits that thus accrue he can underbid his competitors who sell by a more expensive method.

Again the mail order method of selling finds great favor with the public, which realizes that its common enemy, the middleman, has been eliminated and therefore believes that by mail order buying it can secure good goods at bedrock prices.

In mail order selling, stamps, stationery, and well-written selling letters can be made to do the work of a dozen high-priced salesmen on the road. Not only this but the mails go everywhere and there is no limit to the territory you can cover by correspondence, whereas the territory that can profitably be covered by traveling salesmen is limited by (1) its population, and (2) its distance

from the nearest source of supply of the product.

We do not claim that correspondence selling is an adequate substitute for the traveling salesman but that in the matter of comparative costs it is an excellent substitute in some territories. For instance, territories that are only sparsely settled can be sold with far less expense through the mails while thickly settled territories can be sold with far more certainty by traveling salesmen.

Moreover the people of the large cities look with disfavor on mail order buying while in the smaller towns and in the country it is largely patronized. Hence the manufacturer or jobber who makes the most sales with the least selling expense is the one who combines a mail order force with his traveling force for in this way he is able to nationalize his product at a minimum expense.

Of course there are articles, like books of the correspondence school kind, that are adaptable to correspondence selling only. Likewise there are other products such as the motor car, that obviously are not adapted to the mail order business at all. One of the reasons for

this limitation is that the mail order articles are sometimes sold upon the *free trial* and *approval plan* and consequently small articles are much better adapted to this branch of selling than the larger ones are.

But in the majority of business lines personal and mail order salesmanship must be combined to the end that the largest sales can be achieved at the least possible expense. So even if you are running a business successfully it may pay you to read this chapter carefully and to install a mail order department, and so benefit by a gain of from ten to fifty per cent. in sales with a consequent pro rata reduction in your merchandising expense.

On Securing Mailing Lists. Your first need in starting a mail order business is a list of possible prospects whom you want to reach, and whom you believe can be interested in your product, or a *mailing list*, as it is called. Lists of this kind that give the names and addresses of people in every community, town, city and state in the Union can be bought.

Further these lists are classified into professions, occupations, and businesses and in this way you can get a list which contains the

names of people who are particularly interested in your product. Thus if you are manufacturing or handling a motor-car accessory you can get a list, or lists, giving the name of every motor-car and garage owner and of every motor-car and accessory supply house in the United States.

It is easy to see that if your main organization is in the East and your farthest western branch is in Chicago it will be to your advantage to sell in the far West and Southwest through the mail instead of sending traveling salesmen to these remote parts of the country.

For instance where you have a high-grade article of general interest and you want a mailing list of prominent wealthy and well-to-do buyers, you can get the names from *Who's Who*. Many thousand practical suggestions for getting mailing lists at the lowest possible cost are contained in a volume called *A Directory of Mailing Lists*, which is published and for sale by the publishers of this book. They will be glad to send a descriptive circular on request.

Getting Prospects through Advertising. Another way of conducting a mail order busi-

ness is to start an advertising campaign in the newspapers, periodicals, or trade journals. The amount of advertising you do will be limited by (1) your finances and (2) by the product you are marketing.

It is the usual procedure to have a printed coupon attached to the advertisement which the prospective buyer has only to clip from the paper, fill out, and send in to you. The replies you receive from these advertisements will give you a list of active prospects to the majority of whom you can reasonably expect to sell.

A list of names obtained in this way is very valuable because you have already secured the attention, interest, and in most cases the desire to own, of the prospects, before you send them your first letter which ought to and usually does induce the buying action. While this kind of a list costs more than the ordinary compiled list you will find it a *live* one and you should by all means use it for your mail order campaign.

Getting Agents through the Mails. In the plan above outlined it is customary to also make a bid for agents and dealers to handle

your product by adding this request to your advertisements.

Still another plan is to advertise for agents whom you offer to start in the mail order business. In this kind of a proposition you will sell direct, to those who reply, a certain quantity of your product for either cash down or on a credit basis—we prefer the former.

Together with the goods you also send circulars, follow-up letters, order blanks, etc. Then all that your agent has to do is to make up a list of prospective buyers in his home town or the surrounding country and mail out the literature with which you have supplied him. This is a very good scheme providing that you supply the agent with a series of follow-up letters that have a real selling punch in them for it enables you to sell in quantities with a comparatively small office force. All of these plans are shown in Fig. 13.

And right here let us add a word of caution against the evils of misrepresentation especially through the mails. Misrepresentation can be made in advertising, over the counter, on the road, in fact anywhere and everywhere and the salesman responsible for it can get

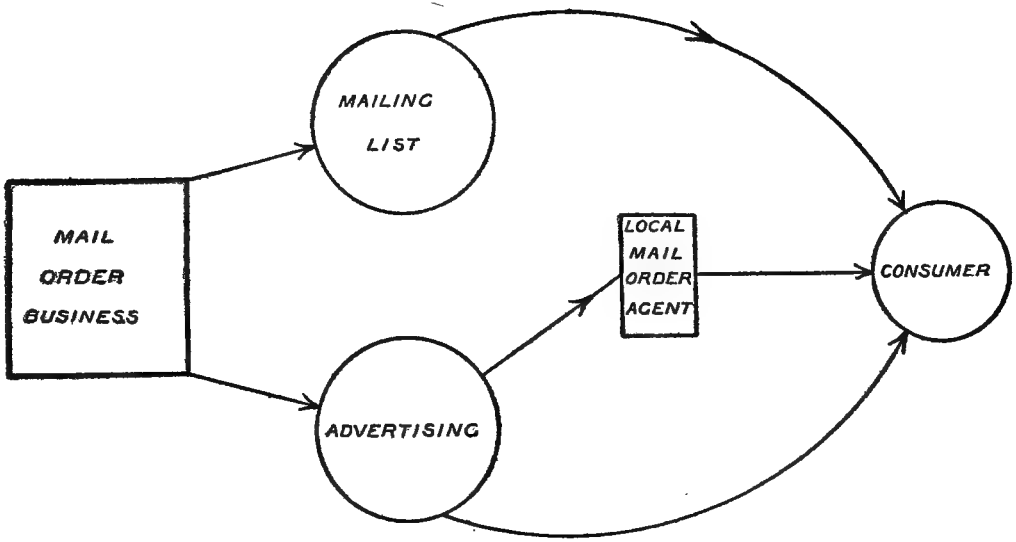

FIG. 13—HOW TO SELL THE CONSUMER THROUGH THE MAILS

away with a whole skin and a slightly damaged reputation.

But to play safe never try to misrepresent anything through the mails for your Uncle Sammy guards against this breach of business ethics very zealously, and he has made violations of it a Federal offense. Having relieved ourselves of this choice bit of advice by way of the prologue now let's go on with the story.

What Mail Order Correspondence Is. Mail order correspondence consists of a series of letters each of which is a selling talk and each of which must be a masterpiece of business literature if any one of them, or all together, are to make a sale for you.

These letters take the place of the personal salesman, greet the prospect in his morning mail, and put up to him a selling talk equal to that of your best salesman if he was there to handle it, and without giving the former a chance to ask a question. The letters must therefore possess all the tact, initiative, mastery, and convincing qualities of a top-notch salesman and they must have in them a point of contact that cannot be ignored.

In other words a successful selling letter

must have incorporated in it the same basic principles of salesmanship that are necessary to a successful selling talk made by a red-blooded salesman. You certainly wouldn't expect a poor salesman to be able to sell your goods to a hard prospect and you can't expect a haphazard selling letter in which none of the laws of selling are complied with to do it.

The Art of Sales Correspondence Writing. You will recall that back there in the chapter on *Selling Over the Counter* we gave you some information about display and we also imparted the advice that, since it is a specialized art, you would do well to employ a display artist to help you make your sales.

What we propose to do in this chapter is to give you the main principles of sales correspondence writing, but our advice is to hire a correspondence writer who can inject into your letters the selling punch. Many men have special aptitude for writing letters of this kind and perhaps you are one of them. If so, after you have read this chapter you will perhaps be competent to write your own sales correspondence.

And let us say right here that simply because

a man is a successful salesman it does not signify that he can write good sales correspondence, as the following episode shows. A large publishing firm was contemplating going into the mail order business. It was the most natural thing in the world for them to pick their best salesman to write their selling literature for them. After the first batch of letters were sent out it was found that the returns were practically *nil*.

Now at that time there happened to be in the new department a young man who was employed in a rather lowly capacity, but with all the confidence of youth he felt that he understood the art of writing letters that would sell books. He wrote and submitted samples and after much argument he was given a try out. His letters were business getters and he turned out so well that he is today the head of the mail order department while the salesman is still on the job in which he has been so singularly successful and that is selling books by word of mouth.

The fact that a man is an adventurer does not at all imply that he can write thrilling tales of adventure, neither does the fact that a

salesman is successful prove that he can write selling literature. Writing is an art and when you want literature the best way to get it and to get the best kind of it is to employ a pen artist who can draw word pictures.

Kinds of Stationery and Printing. In the make-up of a selling letter the stationery used and the method by which it is printed is of the greatest importance. Use a good bond paper and have the printing on it plain and neat and the type small. Avoid complicated designs and fancy type as they make a letter-head look gaudy, are in poor taste, and altogether they distract the mind of the prospective buyer from the significance of the message.

A simple letter head that contains only the essential information needed, and the thought of pleasure, or profit, or both, to be derived by the reader by the possession of the article you offer, sets up in his mind subconsciously a favorable impression that tends to bring him to buying action.

Use envelopes that are designed like and match up with your letter heads. When we say *good bond paper* we do not mean that the paper must be too high grade or costly—

except where you are selling to society women, or to those who think they belong—but at the same time it must not appear flimsy or cheap for stationery of this kind will have the effect of cheapening your selling talk.

The Use of the Mimeograph. Where you want to run off only a few letters at a time a *mimeograph* or some other kind of a duplicating machine can be used and the requisite number of copies can be easily and cheaply made. But where a large number of letters are needed then the printing press may have to be used.

In Regard to Printing Letters. Since you may want to send out anywhere from five thousand to fifty thousand letters at a time, depending on the volume of business you expect to handle you should have them printed.

To do this have your typist write a letter on the machine just as you want it; this done take it to your printer and have him set it up in typewriter type that exactly matches it, and then use an ink that is the same shade as your typewriter ribbon.

Of course you will have blank spaces left at the top for the date, and the name and address

of your prospect and this your typist must fill in with a machine. Also have a space left at the bottom of the letter for your signature.

The Psychology of a Selling Letter. Now the psychology of a selling letter is such that if it is apparent to the reader that the letter he has received is a *stereotyped* form, that is, a mere printed duplicate of an original letter, he may perhaps lose interest to such an extent that he will not even take the trouble to read it through but will throw it into the waste-basket. If, however, the letter appears to be written especially for his benefit, and to all intents and purposes is a direct appeal to him, he may at least read it through.

So in filling in the date, and name of the addressee, the greatest care must be taken to select a ribbon for the typewriter used that will match the color of the printed body closely enough so that it will escape casual detection. A very slight difference in the color of the inks, the style of the type, or the imprint of the latter on the paper will spoil the whole effect of the letter for these things will make the letter lose the personal touch that is so needful to the successful selling letter.

However where an inexpensive article is being sold through the mail you will find that you may get just as good results from your letters by leaving out the name of the prospect and putting in instead *Dear Sir*. With expensive products it has been found desirable to supply the name of the prospect if you are to get the best results.

Finally the signature on each filled-in letter must be written by hand for nothing gives a selling letter more force than the personal signature—supposedly so—of the head of the firm that puts it out. A letter prepared in this way appears to the average man, who is not versed in the art, as if the president of the firm himself had taken the time and the pains to dictate and sign a personal letter to him.

How to Put the Selling Punch in Your Letters. The two most important parts of a selling letter are the opening and the closing paragraphs of it. If these two parts are not handled exactly right no matter how good the rest of the letter may be it will prove a failure. This means that you must exercise the greatest care with these parts.

The opening of the letter must contain the

elements needed to arouse a deep interest in the reader and at the same time it must put you on a friendly footing with him—that is, it must close the point of contact. There is nothing that arouses a deeper interest in the average man than to tell him that you can help him to make money or to save money.

To gain a friendly footing nothing works better than giving the personal *you* and *I* tone to your letter. This is the way the salesman talks and this is the way to make your letter sell your goods. Suppose that you are selling an office appliance that saves time, money, and labor, as for instance a *dictaphone.* The opening paragraph of your selling letter would read like this:

> Let me show you how to save money! I can cut down your office expenses to half what they are now. Every week that you continue to use the old-fashioned tiresome and expensive personal dictation method you are paying for service you do not get.

Here you have touched the tender spot of every man's natural desire for gain and the personal element is brought in by the use of

you and *I* giving the letter a human sound that makes this silent agent supplant the voluble salesman.

In bygone days it was thought good practice to start a letter with such formal phrases as "We wish to call your attention to, etc., etc." Letters were ended with like dry-as-dust phrases such as "Trusting to hear from you favorably, etc., etc." A letter worded in this stiff and formal style today is simply so much paper and ink wasted. Imagine a salesman putting up a selling talk in such trite and stilted terms! He would be a failure, of course, and so will a letter in which they are used.

There is another thing that you must incorporate in the opening of your letter and that is a statement which establishes a successful point of contact between the prospect and yourself. As an example suppose you are selling a patent letter opener in which event you can start your letter off like this.

> After you have spent a couple of laborious and tiresome hours opening your morning mail by hand and you reach a breathing spell, I want to tell you about my quick and easy letter opener.

In this kind of an opening you at once establish a point of contact between the business man and yourself by showing him that you are cognizant of the tiresome routine he goes through with every day and that you are ready to hand him a means by which he can save his valuable time and get rid of the irksome task.

Just as a clever opening is needed to make your prospect read your letter, so must the close of it have the punch that will bring him into buying action. No matter how good the letter is if the close of it is weak the prospect will not buy. It is exactly on a par with a salesman who delivers a good strong selling talk to a man and then walks away without clinching the argument.

Instead what the salesman does is to get out his order blank, put his pen into the prospect's hand, and say, "Sign here." The successful selling letter must, hypothetically, do the same thing. The "trusting to receive your order at an early date" close is a failure because it lacks decision and hence buying action, that is to say, it is not the equivalent of getting out the order blank.

To get your prospect to send in his order by return mail you must say something in your close that pricks him into immediate action. The inertia of the human mind is just as strong as that of any material object when it comes to buying, *i.e.*, parting with money, and it requires selling force to overcome it. Fortunately there are ways to do it and one of the best is to offer a cut price for quick action.

Thus a selling letter for a set of books closes like this:

"You have just three days more to take advantage of our special offer. On October 14th, the same set will cost you $5.00 more. Send for your set *now* and save money."

Or again point out how the prospect is losing money every minute he is without your product and this will urge upon him the necessity for immediate action. Thus,

"Remember our mechano-adder saves you from five to fifty dollars every day. Get yours now and it will pay for itself twice every week."

The Body of the Letter. We have just shown you the importance of a correct opening

and closing form for a selling letter, so in writing a letter of this kind give your best thought to these parts and get them down where you know a man will steal a watch and chain in order to buy and then spend as little time on the body of your letter as you choose.

But when writing the body get right down to facts, tell in simple language and in a straightforward way why he must have your product and the terms upon which he can buy it. It is a noble scheme to have several different plans upon which the article can be bought, for your letters are going to all manner of prospects who are in varying degrees of affluence. Hence terms that are easy for one may be too hard for another. The layout of a successful selling letter is shown in Fig. 14.

About Follow-up Letters. In a few cases your first letter will sell to the prospect, but the majority will fail to buy on the strength of the first letter, due to the same inertia we mentioned a few pages back and it is for the benefit of these inactive prospects that you send out a series of *follow-up* letters.

Even as drops of water finally wear away the granite, so, also, will a series of well-written

follow-up letters overcome this inertia by the cumulative effect of their selling force and

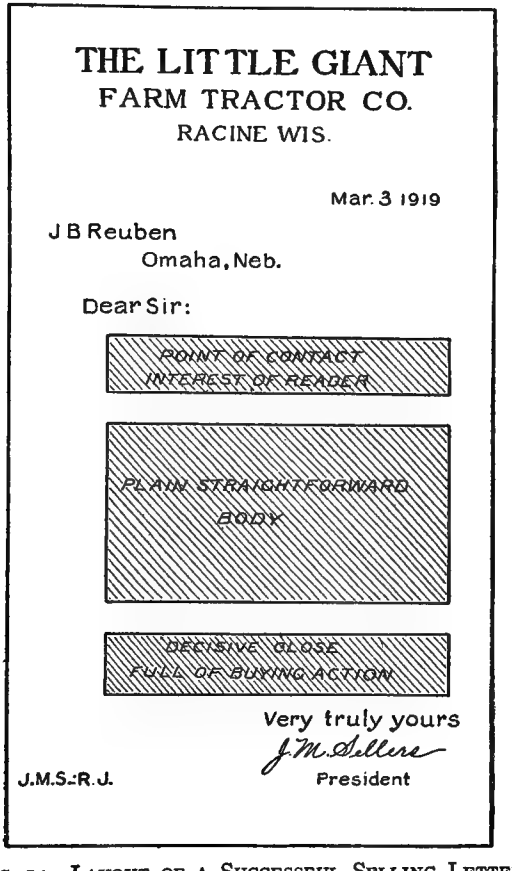

FIG. 14—LAYOUT OF A SUCCESSFUL SELLING LETTER

make the prospect a buyer. Follow-up letters are written on the same principle as the first

letter except that you will in each make the story a little stronger in describing the merits of your product and your offer will become a little easier and more liberal to meet, but withal insistent in demand, in each succeeding letter.

When, after the fourth letter of such a series your prospect fails to reply, you can then take him mildly to task for letting you waste your time and stamps on him and ask him for the courtesy of a reply. If this last attempt fails you can then conclude that it is not inertia on his part but absolute lack of desire for your product that is preventing you from making a sale and your best course then is to remove him from your list of prospects.

Enclosures with Letters. There is much to be said both for and against enclosing other matter with letters but if you do it right then nothing but good can come of it.

The proper enclosure for a letter is a small circular, cleverly worded, designed, and illustrated, that explains the merits of your wares and their uses. Such an enclosure not only heightens the effect of your selling letter but often carries the weight needed to make the

prospect buy where your letter alone would not.

A circular is at its best when it is printed in colors and illustrated, for man is still closely enough related to the savage so that colors please him, and yet he is civilized enough to want to know how everything works. A circular of this kind is a selling talk in itself.

Long Letters versus Short Ones. No business man will take the time to read a long-winded letter, so in writing letters to business men let them be short and full of *pep*. On the other hand people who live in the rural districts will read long letters through, not only once, but several times if your opening paragraph appeals to them.

But as a rule long letters are taboo, for with them just as with personal salesmanship there is such a thing as over-talking your subject, that is, after working the prospect up to the point where you have all but induced the buying action—instead of clinching it the resolve peters out in the reading.

Writing Collection Letters. In mail order selling the article is often sent *on approval*, that is, it is sent to a prospect who is given

the option of returning it if he is not satisfied, or paying for it if he keeps it. Further it is customary to allow him time in which to pay for it, that is, credit is extended to him.

As a consequence of this procedure in making sales through the mails you will very often run up against one of two propositions, and these are (1) the prospect after receiving the product on approval will deliberately fail to return either the cash or the product, and (2) he will make a few payments and then stop.

The first default is theft pure and simple. In handling a case of this kind it is the best procedure to assume that the prospect is still considering the matter of buying it but that he has not yet fully made up his mind. Write your first letter on this basis but if you do not get a reply then write a second letter with the request that the article be paid for or that it be returned at once.

You can, if this does not bring the price or the article, write a third letter stating that unless one or the other is immediately forthcoming you will have to take the matter up with the Federal authorities. If this letter fails to have the desired effect your only re-

course is to lay the matter before the post-office officials, for the man has obtained the article through the fraudulent use of the mails.

The second case must be treated a little differently and you work on the assumption that the customer's intentions are probably honest, but either through carelessness or lack of funds he has failed to keep up his payments. This breach of contract simply resolves itself into a case of *collection* and you will find detailed treatment of this disease in the chapter on *Making Collections* as well as directions for writing collection letters.

CHAPTER VIII

KEEPING A MAP AND TACK GRIP ON YOUR BUSINESS

What the Map and Tack System Is—Map and Tack Appliances You Need—The Map Cabinet—About the Maps You Need—The Thumb Tacks—The Colored String—The Map and Tack Card System—Mapping Out Your Business—Traveling Salesmen *versus* Resident Agents—How to Use the Card System with Maps—Keeping a Map and Tack Grip on Your Business—What the Maps Show You—Cross-Indexing Your Sales—To Determine the Value of Local Advertising.

THE successful business man is one who is able to *visualize* the operations and policies of his business, that is, he is able to project a clear-cut image on the screen of his mind and to mentally view these various activities as though he were looking at a moving picture.

Now in a large number of lines of trade where traveling salesmen are employed the business man finds himself up against the proposition of keeping tab on them, his customers, and on his prospects; and his success depends almost altogether upon the extent and means he employs to overcome these

obstacles by taking rational and speedy action on short notice.

This state of affairs has led the successful sales manager and buyer to develop a scheme for visualizing not only his firm's policies but the *actual selling campaign* as it is being carried on from day to day. This is known as the *map and tack system* and by means of it the efforts and results of any kind of a selling or buying force, no matter how far away they may be from you, are brought immediately under your personal supervision, that is, you *visualize* them.

This system is simply an extension of the card system described in Chapter II, Part I, and while we shall explain its uses in detail in this chapter in its relation to selling, it can also be used just as effectively for a buying force in connection with the tickler file.

When you come to the chapters on buying and especially Chapter II, Part III, you will find out all about the latter device. A combination of the tickler file and the map-and-tack systems will enable you to keep an eye-that-never-sleeps, and a handcuff-grip, on your selling forces and on their sales.

What the Map and Tack System Is. The name "map and tack" is self-explanatory of the system as a whole, but in detail it consists of one or more maps, that show the selling territories, on which are arranged vari-colored tacks and strings to represent the necessary selling data.

By the simple manipulation of these concrete and visible things the activities of a force in fields however distant are brought to a sharp focus and under the direct gaze of the sales manager. In point of value this system is next to placing the sales manager right on the actual selling ground. From this it is easy to see that the map and tack system is highly useful in any business where the majority of the activities are carried on in distant fields and must of necessity be controlled and directed from a central office.

It is a valuable part of the sales manager's scheme and system of organization for keeping a comprehensive grip on the selling force and its sales and it brings home to him the important events of the campaign by placing them directly before his eyes.

Map and Tack Appliances You Need. The

size of the map and tack system you need depends upon three things and these are: (1) the extent you rely on it to keep you informed; (2) the size of the selling force you employ; and (3) the expense you want to incur in the purchase and maintenance of the initial layout.

The best plan to build up a map and tack system is to map out a few of your territories and then expand your system gradually as the volume of business you are doing warrants. Whatever the size of the map and tack system you want to start with you will need the following appliances, namely: (1) a *map cabinet;* (2) the *maps;* (3) some *tacks;* and (4) balls of *varicolored string.*

The Map Cabinet. This cabinet is simply a case of shallow trays large enough to hold the maps so that they are handy for quick reference. Practically any kind of a case will do if the drawers are long and wide enough to hold the maps and are not too deep.

The proper kind of a cabinet has a number of drawers each of which is about one inch deep and, let's say, three feet on the sides to contain the maps of the various territories your salesmen are covering. You can have a

carpenter or cabinet maker make a cabinet for this purpose, or better you can buy one ready to use. There is only one map put in a drawer so that when you want to use it you have only to open the drawer.

The number of drawers in the cabinet depends entirely on the two following things, (1) the volume of business you are doing and (2) the scale of the maps you are using. The first point at issue, of course, depends to a considerable extent upon the kind of territory your salesmen cover, while the second point will be more fully explained presently.

Since the drawers are of the above mentioned size you can fit into each one a map of a territory, or part of it, depending on its size and, in passing, this must be large enough so that you can read it. Thus if you are operating in twelve territories you will need twelve drawers in the cabinet.

It is a good plan to have your cabinets built in sections, each of which contains twelve drawers, after the style of the sectional bookcase. In this way you can easily take care of the extra maps required as your business grows. The bottoms of the drawers are made

of soft pine about ¼ inch thick so that the tacks can be pushed into the wood easily.

About the Maps You Need. The maps should be good and large and plainly printed in colors showing the principal railroad lines, highways, and roads and having the cities, towns, and villages accurately placed upon them.[1]

Each map must be a full and complete one of a given territory or if you are operating in a small section of a territory intensively you must get a special *large scale map* of that particular part of the territory.

Now by the *scale of a map* we mean the size it is drawn to compared with the real size of the territory it represents. For the sake of convenience maps are drawn to various scales depending on what they are used for. In the lower left-hand corner of every map you will find a graduated line with numbers marked on it that shows what scale the map is drawn to, thus: 1 inch = 5 miles, which means that one inch on the map represents five miles of actual territory.

[1] These maps can be bought of C. S. Hammond & Co., 30 Church St., New York.

For the map and tack system scales of from five to twenty-five miles to the inch are good ones to use, the larger scale being used, of course, on maps where the territory is thickly settled and the centers of business interest and activities lie closely together. As the chief value of the map and tack system lies in your being able to comprehend the situation at a glance, the larger the scale the maps are drawn to the easier it will be to do this.

The Thumb Tacks. Tacks are used to represent the different centers of interest to the sales manager and chief among these are his salesman and agents, customers, and prospect. Since all of these cannot be represented by tacks having heads of the same color the following color code will be of service to you for it will enable you to distinguish one from another at a glance.

Green Tack - - -	Exclusive Agent
Red Tack - - - -	Traveling Salesman
Black Tack - - -	Customer
White or Plain Tack -	Prospect

Thumb tacks having heads of these various colors can be bought of stationers or dealers in

drawing materials; they have large flat, enameled heads with short, sharp-pointed steel shanks. All you need to do to put them into the board of the drawer is to press on them with your thumb.

The Colored String. You will only need three colors of string and these are green, red, and black. The green string is used to enclose the area held by an exclusive agent if it is larger than a city; in case it only covers a city of course a green tack is sufficient.

The red string marks out and indicates the territories taken by your traveling salesmen while the black string is used to show where the men are from day to day, just how much of the territory they have covered and just how much they have yet to cover.

The Map and Tack Card System. From what we have said above and the description of how to use the maps which follows shortly you will see that by means of this system you can, like an East Indian mahatma, project your mental self through space in the twinkling of an eye and camp on the actual ground your salesmen are covering.

In this way you can gain a wealth of infor-

mation and the only thing that is lacking is a scheme for recording the data thus obtained from your maps day by day, for as you alter the tacks and strings in accordance with the movements of your traveling salesmen the information they gave you yesterday and the day before is likely to be forgotten to-morrow and the day after.

To make the map and tack system a complete success a *card index system* is necessary and this consists of four separate and distinct sets of index cards, namely: (1) an index card having at its top the name of the city or town and having at its bottom the name of the salesman or agent handling that city or town; (2) an index card having at its top the name of the salesman or agent and having at the bottom the name of the city or town; (3) a *blue index card* having at the top the name of the customer and at the bottom the customer's purchases and needs together with the salesman or agent who sold him; and (4) a *yellow index card* having at the top the name of the prospect and bearing the same information. These cards are shown in Fig. 15.

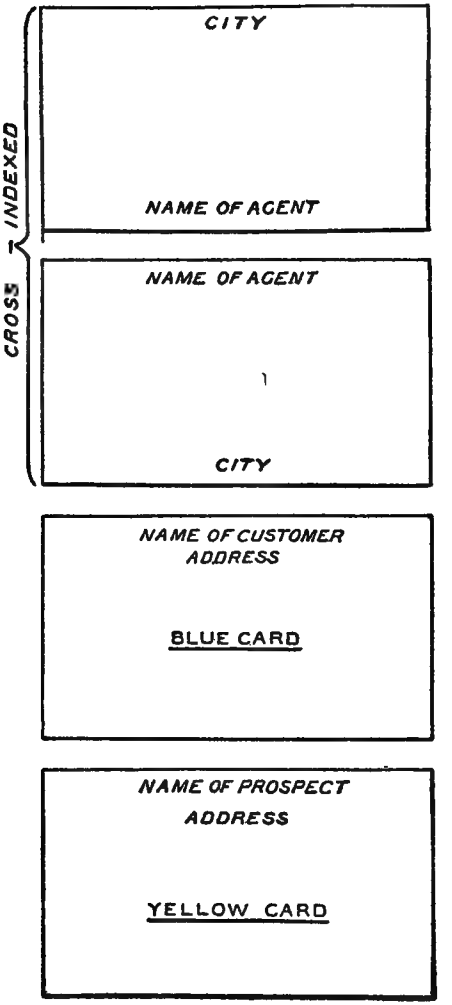

FIG. 15—MAP AND TACK CARDS

These last two cards are filed alphabetically by name under the different territories they fall in. The first two sets of cards while apparently the same are simply to enable you to cross-index towns and salesmen. By means of this method of filing you can instantly find out just who the agent is in a given town or just what towns a given agent is selling.

The card index system used in conjunction with your maps gives you a permanent record of what has been, is being, and is yet to be done that can be had and kept in no other way and, as you see now as well as later on, it is an admirable method and an invaluable aid for getting the right angle on your selling force.

Mapping out Your Business. Knowing now how the map and tack system works, the next thing to do is to apply it to your selling force. To begin with there are two things that you can easily do with it right at the start, both of which will save you time and trouble.

These are (1) laying out routes and mapping territories, and (2) following your salesmen day by day and watching them do their work. Now let's see just how the map and tack system works out in a specific case. Suppose

that you are handling sales for an automatic feeding device for poultry and that you are sending Brown out to cover northern New Jersey, and sell direct to the retail trade.

Take your map of northern New Jersey, lay it out on the bottom of one of the shallow drawers and with four ordinary thumb tacks secure it at the corners. Next take your red thumb tacks and red string and start anywhere on the perimeter, that is the outside boundary, of Brown's territory, insert a tack in each of the cities and towns on it until you return to the first tack, when you will have a tack outline of Brown's territory.

Then take your red string, tie the end to one of the tacks in the outline, carry it on, and give it a turn around each succeeding tack until you return to the tack you started from and tie it there. The area you have thus enclosed is Brown's territory. In the same way you can easily map out territory and allot it to your salesmen without any danger of its overlapping, that is, of assigning a portion of the same territory to two or more salesmen at one and the same time.

Having laid out the territory the next thing

is to outline to Brown the route he shall follow in covering it. This is done by starting on the perimeter, at a city or town nearest your home office, and inserting tacks in the cities and towns which in your judgment will prove profitable and to which you want Brown to sell.

In doing this you must use all due care in mapping out the cities and towns in sequence so that the route is as short and easy as possible and, what is even more important, that Brown will not at any time have to double back on his tracks and thus cover the same ground twice.

Now take your black string and tie the end to the tack in the last city or town on his route and go on to each preceding city or town that he will hit and give it a turn about each tack; continue in this manner until you reach the first city or town that Brown is to sell to and there tie the string to the tack in this city or town. The black string will then be wholly within the red stringed enclosure and will represent Brown's route.

Having given Brown his final instructions and sent him on his itinerant way rejoicing, you are then ready to follow him in his travels and tribulations. When you get Brown's first

report card you will know he has reached his town and you will then untie the black string from the tack in the first city or town and wrap the free end of it around the tack in the next city or town which Brown is scheduled to reach sometime in the near future. Keep on in this fashion as Brown progresses on his route and you will then be able to tell exactly where Brown is by simply glancing at the map. See Fig. 16.

Traveling Salesmen versus Resident Agents. You will find very often that in certain towns and territories you can get a jobber, wholesaler, or retailer to handle your line and do as much or more business for you at less expense than if you sent traveling salesmen into the same territory. Where such a condition obtains of course it is to your advantage to turn your line over to a resident agent as he is called and give him the exclusive right to sell in that city, town, or territory.

Where a resident agent sells to a city or town you simply push a green tack through the part of the map that represents it. But if he commands a territory put a number of green tacks around its perimeter and connect them

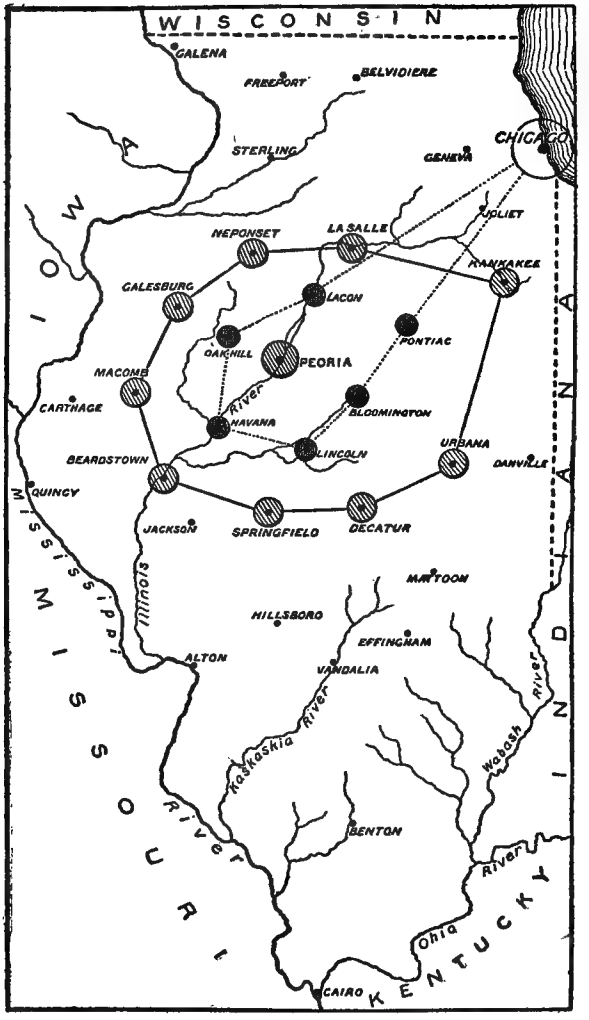

FIG. 16—MAP AND TACK SYSTEM APPLIED TO YOUR BUSINESS

with a green string, thus plainly marking out his agency. Also put a green tack in the city or town where the resident agent has his headquarters.

When mapping out territories for your traveling salesmen and for new resident agents who are going to handle your goods, you must take particular care not to encroach on the territory you have already allotted exclusively to some of your other selling force, for nothing makes a fellow so angry as to find someone poaching on his little preserve.

How to Use the Card System with the Maps. To get the full benefit of your maps you want to make use of the information they afford by taking advantage of your index cards at the same time. To do this file the cards containing the data away for future reference; the first two cards mentioned under the heading of the *Map and Tack Card System* can, of course, be filled out before your salesmen start on the road.

As the daily reports from your salesmen begin to come in you manipulate your maps accordingly, putting black tacks in the cities and towns where your salesmen have taken

orders and white tacks in the cities and towns where lively prospects are located. From this material you now fill in your blue and yellow cards which we mentioned before and file them alphabetically.

All of the mechanical work entailed in map manipulation and filing operations you can have done by low salaried employees and hence at small expense.

On the other hand a well operated map and tack system needs constant watching and every change must be made upon it the moment fresh information is received, for unless the cards are kept right up-to-the-minute it will not give you the service you need. As soon as prospects are sold and become customers the white tacks must be replaced by black ones, the yellow cards, removed, and new blue ones made out.

Keeping a Map and Tack Grip on Your Business. Now let's go a little deeper into the way a map and tack system is of use to you in keeping a firm grip on your selling force. There are three chief things that you can discover from your maps at a glance and these are: (1) undeveloped fields; (2) the results of

your salesmen; and (3) the results of your advertising.

Your maps will show you where there are territories which your salesmen have not yet covered and you will know in an instant where to direct an inquiry so that you can get a line on whether an undeveloped field is worthy of exploitation. In connection with this use of the maps it is an excellent plan, if your business warrants it, to use the following device which will serve to show not only undeveloped fields but the strength of competition in the fields you are already operating on.

A separate series of maps can be laid out showing the territories in which your competitors are operating and in which they are the strongest. Such a series of maps will be of great assistance to you in mapping out the territory for your own traveling salesmen. For this purpose you will find a large wall map better than a number of smaller maps.

From your maps and cards you can obtain the results of any individual salesman on the force and you will be able to tell at a glance the sum total of the selling power of the individual salesman. Thus a large collection of

black tacks in a territory means that the salesman is a *live wire.* Many white tacks and a few black ones indicate that a large number of prospects have been called upon though but few have been sold. If after a reasonable length of time the percentage of black tacks does not increase and multiply it is your cue to find out where the trouble is.

As a further aid to you in this line it is profitable also to cross-index your sales and prospect cards as to territory. You will then be able to gain the same information from your files, except, of course, that it will be more detailed and complete and, hence, of increased value to you.

From these sources of information and the financial, weather, and salesman's reports, you can arrive at a fairly definite conclusion as to whether the trouble is with your salesmen or whether the territory is dead, and ought to be buried.

The Value of Local Advertising. And finally the value of local advertising can be determined in the same fashion by the sale you are making. If you are advertising to an equal extent, that is commensurate with the popula-

tion, in all the sections you do business in, and you find that you are getting far better results in some territories than in others, find out first whether your selling force is at fault.

If it is doing its best then it is a pretty good sign that the field is inherently sterile and that you are throwing good money after bad in advertising heavily therein. When you once get into the habit of using this system you will be surprised how much routine it will lift from your shoulders and the extent to which you are able to feel the pulse of your business beating by means of it.

You will also find as you grow skilled in its manipulation and in interpreting the meaning of its varied phases that it is the only original cure-all for doctoring up all kinds of sick and declining sales.

Part II

Expert Buying

CHAPTER I

THE ESSENTIALS OF SHREWD BUYING

Tangible and Intangible Merchandise—Shrewd Buying Lowers the Cost of Production—The Applied Principles of Shrewd Buying—Training a Good Buyer must Have—What a Good Buyer must Know—What the Buyer must Know about his Goods—What the Buyer must Know about Demand—What the Buyer must Know about the Houses he Buys from—Two Kinds of Buying.

HAVING read now about the various phases of *selling* you are ready to learn something of the second great branch of merchandising and that is *buying*.

Now buying is the reciprocal of selling, for it is obvious whenever goods are bought or sold there is a mutual interchange between these two actions and, hence, these prime parts of merchandising are so closely allied that if you are proficient in one you must be efficient in the other. See Fig. 17.

Tangible and Intangible Merchandise. Every business, no matter what its nature, is based on the buying and selling of (1) tan-

gible effects, or *merchandise*, as goods, wares, or commodities are called, and (2) intangible effects, or *service*, as labor and professional assistance are known.

There is no such thing as a business where selling alone or buying alone is the sole and only operation. Manufacturers must buy raw materials and jobbers and retailers must buy finished products before they can sell, and having once bought they must in turn sell to keep on doing business.

From this, you can see that buying is just as important a part of merchandising as selling and this is due in a large measure to the highly competitive market that we are up against to-day.

As a shining mark lets take a firm that manufactures spark-plugs. There are approximately one hundred spark-plug manufacturers in this country, and strange as it may seem the plugs turned out by all of these companies are as like as a hundred peas laid in a row in their design, construction, and operative merits.

This being true not one of these hundred firms can lay claim to any distinct or real

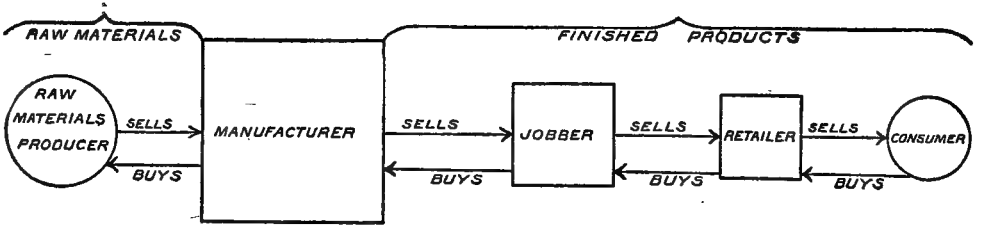

FIG. 17—BUYING IS THE RECIPROCAL OF SELLING

advantage over the others. To sell an article where there is such strenuous rivalry requires ability of a high order and the plug that is advertised the most widely, made of the best materials, and sold at the lowest price will naturally sell the easiest.

Shrewd Buying Lowers the Cost of Production. There are several things that make up the cost of production and these are (1) the quantity manufactured; (2) the cost of labor; (3) the cost of overhead; (4) the cost of selling; and (5) the cost of raw materials.

In not only the spark-plug business but many others as well the first four factors can be and are brought to practically one and the same standard by each and every company. The one outstanding factor, though, which is always more or less variable is the cost of raw materials; this is where qualitative buying comes in, and this can make or break a manufacturer's chances of competing in a close market as the case may be.

A manufacturer who can buy his raw materials at a lower cost than his competitor can make a plug of equal merit at a lower selling price and, consequently, he can come pretty

nearly owning the market. So upon the skill of the buyer largely depends the ability of the manufacturer to get his share of the trade in a highly competitive market.

Now while we have used the manufacturing business here as a type for the sake of exemplification and discussion, what we have said applies equally well to the jobbing, wholesaling, and retailing lines of trade and so we can add that shrewd buying is the thing that enables all lines of trade to keep afloat in the sea of big business to-day.

The Applied Principles of Shrewd Buying. The greatest degree of profit making in a business is attained only by a carefully balanced business machine where the two great levers of merchandising, buying and selling, operate at their maximum efficiency.

It makes not a bit of difference how good your selling force is, if your buying force is not up to the same high standard it acts just as though you had dropped a monkey wrench into the gears of your business machinery and will cause your ultimate downfall.

There are two great factors in buying cheaply and these are: (1) having the ready

money and (2) buying in large quantities. The larger the quantity of materials purchased the cheaper it can be bought and, where time must be had, the better the terms the buyer can make for its payment. Often the financial resources of a firm limit the quantity of goods that it can buy and, further, future market values and conditions limit the quantity of material that should be bought.

For instance, a clever buyer makes an opportunity for his firm to buy an extra large quantity of a certain staple commodity at an exceedingly low figure. The very fact that the commodity is a staple assures it of a steady and continuous sale. But lets assume that this particular commodity we are talking about is a slow seller and that it would take a couple of years for the firm to dispose of the entire lot.

Again lets say that the finances of this firm are limited and it is necessary that for every investment it makes there must be a quick turn-over in order to keep things going. Under such untoward conditions the buyer would be unwise to buy even though getting the commodity at a great reduction, for the turn-over

would be so slow it would be sure to cause his firm financial embarrassment.

Now let us take another example: A buyer is offered an exceptionally low price on a large quantity of novelty goods. Novelties as you may or may not know are freaks and hence their steady as well as their continuous sale is uncertain. Again it would be poor policy to buy a large stock of such goods for (1) there is no telling how rapid the turn-over will be, and (2) the market may go to pieces all of a sudden when of course a heavy loss will be sustained by the firm. This is exactly what happened to the manufacturers and dealers in pyrographic, *i.e.*, wood-burning, outfits a few years ago.

In both the preceding cases, though, the buyer will be severely tempted for on the face of things they are apparently good investments and since he must buy, it seems like folly to buy in smaller quantities, pay larger prices, and get poorer terms. But this is just where the shrewd buyer excels for he not only knows a good investment from a bad one, but he is able to buy in small quantities advantageously.

Shrewd buying, then, may be said to consist of two things (1) the ability to recognize and distinguish good investments from bad ones, and (2) the ability to drive the best possible bargain whatever the quantity of materials his firm needs. As you will gather later on, for a buyer to possess these two essentials he must have an intimate and infinite knowledge about everything that has to do with his business.

The Training a Good Buyer must Have. For a man to become a shrewd buyer, provided he has all the other requisite qualifications, there is only one school that will turn him out at the head of his class and that is the school of experience.

The first thing that the buyer must learn is salesmanship from A to Z in all its varied ramifications, for it is his business to constantly deal with salesman and he must know all the ins and outs of their ways and their strong and weak spots if he is to beat them at their own game.

Second, the buyer must be trained in manufacturing and merchandising methods; he must have an accurate knowledge of raw materials, their production, manufacture, mar-

kets and the conditions that affect the latter, in fact he must know the production end of the business he is buying for from the ground floor up.

Third, he must be a trained executive and know and understand thoroughly the policies of the firm he is buying for, to the end that he may conform to them. Not to know these things makes coöperation impossible and disaster a foregone conclusion.

And fourth, and finally, he must peer into the future and his pre-vision must not fail him. No successful buyer can afford to confine the limits of his mind's eye to the present, for big business has as its goal the future. Buyers who buy for the present alone fail sooner or later because three quarters of buying judgment is futuristic. Hence the training of a buyer must be such that he has a clear foresight of the future activities in his field.

What a Good Buyer must Know. We have just given you a general idea of a few of the things a buyer must know in order to buy well and we shall now tell you of some of the definite and specific things that he must know to buy shrewdly. As we mentioned above, or

what was equivalent to it, a buyer must be absolutely familiar with (1) his own house, and (2) the goods he is buying; and now let's see just how these things influence his judgment and therefore his buying. Figure 18 shows diagrammatically what a good buyer must know

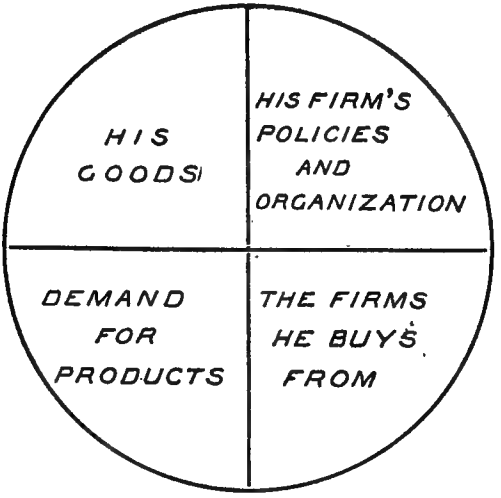

FIG. 18.—WHAT A GOOD BUYER MUST KNOW

Why a Buyer must Know his House. There are four chief things that a buyer must know about his firm or house and these are: (1) the condition of its finances; (2) its policy; (3) the manufacturing processes of its products; and, finally (4) its organization scheme.

The condition of its finances can be split up into two parts and these are: (1) the actual working capital it has on hand including its available credit and (2) the financial forecast for the future. He must know these points for two reasons, namely, (*a*) that he may determine which are the most advantageous terms to buy on; thus, if heavy demands are to be made on the firm's resources he must do *pinch buying*. And (*b*) the firm's resources determine the quantity of goods that he can safely buy; weakened resources or resources that are likely to be weakened in the near future dictate pinch buying.

The policy of the firm or house is equally important. The owners and directors will have mapped out a policy which entails either expansion or curtailment. In either case it is of vital consequence for the buyer to know exactly what it is.

If the policy is one of expansion, heavy buying is permissible providing all other conditions are favorable. But if the policy is one of curtailment the buyer must of necessity do pinch buying. For the buyer not to conform to the policy of his firm or house is to court

disaster, a fluke may cause a lot of inconvenience. The moral is, that a buyer must not make mistakes.

In many concerns the buyer is called upon to buy everything pertaining to the house needs, from raw materials and machinery to laboratory equipment and office appliances. Finally he must know all about the organization of the firm or house. It is his business not only to buy in quantities but to act as a check on the department whose heads must make occasional small purchases and to see that they do not overbuy or underbuy.

What a Buyer must Know about his Goods. The major portion of a buyer's knowledge relates of course to his goods. It covers a very broad field for it is not limited to the technical details of the goods themselves as is that of a salesman.

The buyer's learning includes (1) a clear insight into the law of supply and demand; (2) full information concerning houses that sell the kind of supplies he buys and of their selling methods.

The three chief things that a buyer must keep in mind about the goods he buys are:

(1) their quality and price; (2) their intrinsic values; and (3) the market for them. The matter of quality and price is essential to fair buying. There are often several, sometimes many, grades of every kind of raw material and marketable product ranging down from good, through indifferent, to bad and worse, but for every quality there is a fair and legitimate price it is worth—no more and no less.

This has to do to a large extent with values but not altogether so. The buyer must not only compare the product he is buying with other competitive products on the market, but with an ideal product or material, that is to say, one which is 100 per cent. perfect.

As an illustration take the cotton or tobacco crop. At certain times of the year there is a drop in the quality of the whole crop due to weather conditions and especially is this true in some localities. Clearly for a buyer to buy even the best grade of this inferior crop and pay anywhere near the full market price without reference to the perfect product is for him to cheat himself and his firm.

A complete acquaintance with market conditions is naturally an essential in buying.

With every kind of raw material there are certain fluctuating conditions which affect the market as far as quantity is concerned, and hence the price, and this causes the market of finished products which are made from them to fluctuate also.

Thus crops are affected by untoward weather and insect pests; ores and lumber by labor troubles; and the transportation of all of these materials by both weather and labor conditions. For these reasons, at one time it is a good investment to buy, but at another time it is better to hold off or do pinch buying.

The element of time is a most important factor in buying and it is the buyer's clear perception and keen judgment of the past and present conditions and their effect upon conditions in the future, provided he is right, that makes a man a shrewd buyer.

What the Buyer must Know about Demand. The buyer must have a thorough knowledge of the demand for the raw materials needed by his firm or company and for the finished product sold by it to the trade.

Every manufacturing plant maintains a certain standard under which it is scheduled

to operate when running at its full capacity. The buyer must know what the schedule is so that he can buy the right quantities of raw materials at a time and also what to provide for future needs.

If the buyer fails to buy the necessary quantity of materials to keep the factory running up to its schedule a change will have to be made in the production output and this is an expensive deal.

The buyer for jobbers, wholesalers, and retailers must also have a good grip on supply and demand for the reasons mentioned above. As we have indicated, goods may be divided into two classes and these are (1) *staples* and (2) *novelties*. A staple is an article of necessity for which there is a constant and certain demand. A novelty on the other hand is an article that catches the fancy for the time being.

Fancy is always fickle and there is no sure way to definitely estimate what the demand for a novelty will be or to determine even roughly how long it will hold the interest of the public. Once in a while a novelty grows in favor until it becomes a staple but this

seldom happens if the article is not one of utility.

The buyer must guess the depth of popular favor in a novelty and gauge the quantity he buys accordingly. The closer his guesses come to hitting the mark the better buyer he is. Buying the raw materials for or the finished product of novelties is therefore a harder game than buying staples. But even the demand for staples is subject to change although the change is never a sudden one as with novelties and the market can be accurately forecasted by the experienced buyer.

What the Buyer must Know about the Houses he Buys from. In the early part of this chapter we stated that the buyer must be an experienced salesman. This is because he must have an intimate knowledge of how selling and salesmanship are carried on in the different firms he deals with.

There are five important things that the buyer must know about the firms he deals with and these are: (1) their locations relative to his own plant or house; (2) their reputations; (3) their resources; (4) their operating *bases* (plural of basis); and finally (5) their selling policies.

The location of a house is important because of the shipping problem which affects the expediency of delivery. Shipping is one of the bugbears of the buyer. It stands to reason that in almost all cases the firm to buy from is the one nearest the point of delivery, all other circumstances being equal.

Some factories and houses have very poor shipping facilities and these are good places to steer clear of when you are in urgent need of the goods you buy. It is sometimes a better scheme to pay a little more and be assured that your order will reach you in time, rather than pay a little less and lose out on a sale or a contract because you can't get hold of the materials to deliver or fill it.

Another point is that the proximity of a firm does not always indicate certainty of speed, or surety of delivery. As before these essentials depend upon the facilities of the firm you have bought from and the transportation arrangements it has made.

The reputation of a house is also of great weight and by knowing all about it the buyer can tell whether it will keep its promises. Many salesmen will promise anything to

make a sale but the likelihood of fulfillment can be pretty accurately checked by a record of past performances.

The buyer must also be conversant with the resources of the firm he is dealing with. Take a buyer for a big jobbing house which has advance contracts to supply several wholesalers with a certain product in a given time. If the buyer puts his order with a manufacturer whose finances are shaky and who fails to fill all of the order, the jobber of course can't get his goods in time for delivery as per schedule and this will cause the wholesaler to cancel his orders and to lose the good will of his customers. If the buyer had known that the manufacturer was operating on the ragged edge of nothing he would not have fallen into such an error, and to the end that you may be saved a like experience read the chapter on *Credit.*

To know what the operative basis of a house is, is of deep concern to the buyer. Of course in these days of modern business methods and up-to-date systems most firms know down to the fraction of a penny the exact cost of production and therefore the price they can sell for.

You will though, at times, run up against firms that are extremely lax and to which the exact cost of production is an unknown quantity. In such cases you may find it possible to buy for less than the actual production cost and more often for less than competitive products are selling for.

And, lastly, a buyer must know the selling policies of the houses he deals with. The price-lists issued by these houses are usually far from being true guides of selling prices for the buyer; very often, indeed, the prices quoted are in excess of the intended selling prices.

The reason such price-lists are put out is so that (1) they will give no information to competitors and (2) when an apparently large discount is given, the average buyer feels that he has been favored.

A knowledge of firms and houses that resort to such tricks of the trade enables the buyer to know when he is buying at bed rock and when the prices quoted him are or are not excessive. There are firms, however, that make their first quotation their last one and to know these houses is to save time and argument.

Two Kinds of Buying. In general there are only two kinds of buying and these are: (1) the buying of raw materials and (2) the buying of finished products. Under the head of raw materials comes manufacturing buying; while under the latter head comes jobber, wholesale and retail buying.

Now all that we have said in this chapter applies to both of these kinds of buying. The ideal buyer for either the manufacturing or the finished products trade is one who has had experience in both branches for he then knows the exact processes and materials a product is made of and at the same time he has a thorough understanding of the selling end of the business, or the other way about.

When you find a buyer who has had this kind of a wide experience and who possesses the other qualities cited in this chapter, hold on to him.

CHAPTER II

BUILDING UP A BUYING MACHINE

The Organization of a Buying Machine—The Assembly of the Buying Machine—Some Branches of the Buying Machine—The Tracing Department—The Receiving Department—The Distributing Department—The Accounting Department—About System in Buying—Information through the Perpetual Inventory—System Used in the Placing and Tracing Department—How the Order is Kept Track of—What a Tickler File Is—How the Shipment is Checked up.

JUST as an organized selling force is of paramount importance to your business so also is an organized buying force a vital necessity to back it up. The reason you must have an efficient buying force is that your market is a competitive one and to make a profit you must *buy cheap.*

No matter how great the merits are of the article you are going to sell, if you can't buy the materials and turn it out as cheaply as an opposition manufacturer, or buy the ready-made article at as low a price as a competing jobber, you can't make up your losses on your sales.

From this it is plain that you must use as much, if not more, judgment in organizing a buying machine that will attain a close approximation of perfection, as you do in the organization of a one hundred per cent. efficient selling force. As we said in the last chapter buying is the first half of your business and it must be reckoned with if you are to conduct the other half successfully.

Incompetent and unwise buying has been the cause of more failures of otherwise successful merchandising concerns than anything else, if we except bad credits, and the only way to steer clear of this pitfall is for you to organize a buying machine that you know will not make mistakes.

The Organization of a Buying Machine. Now as with a selling force there are two important parts to a buying machine and these are: (1) the organization itself and (2) the system that must be used in conjunction with the machine.

Back there in the first part of this book we cited that the advantages of organization lay largely in the definite fixing of duties and responsibilities, and this is likewise true of

the buying-machine organization. The first consideration is a head who is responsible for the operation of the machine as a whole and this man is usually known as the *head buyer*.

The head buyer of a buying machine corresponds to the sales manager of a selling force and his is the master mind that directs the efforts of the buying machine and makes it what it must be. Without him the efforts of the buyers would be inarticulate and disjointed and nothing would be accomplished right.

Just as the sales manager must be a master salesman so the head buyer must be an expert buyer and only a long and varied experience will produce such a man. Although your machine may employ buyers of comparatively small or narrow experience your head buyer must be all knowing to direct them.

In establishing a buying machine pick a head buyer whom you have confidence in and then let him use his genius for the choice of the rest of the force. As with a selling force there is only one method of organization that will prove highly profitable although there

are many variations of this method in use, some of which will be better adapted to your line of business than others.

Your head buyer is primarily an executive and he will therefore have ideas of his own as to the manner of the organization he is going to direct. This is fitting and proper and to get the results that both you and he want, you must do everything in your power to help him in carrying out these ideas as long as they meet with, and conform to, the policies of your firm.

The Assembly of the Buying Machine. In the organization of a safe and sane buying machine the first essential is the department that buys or places orders; and this, of course, consists of the buying staff under the direction and supervision of the head buyer.

In a large concern the buying staff consists of two kinds of buyers and these are: (1) domestic buyers and (2) foreign buyers. The domestic buyers are of course always on the alert for buying opportunities throughout our United States. Since the latter is but a very small part of the world's great markets of raw

materials and finished products, especially the former, a progressive firm must have foreign buyers.

Cotton, for instance, grows not only in the sunny south, but in Egypt and India as well. For a large manufacturing firm of cotton products to buy without first consulting foreign qualities and prices would indeed be poor policy. Foreign buyers must, however, have been domestic buyers first for they must have a thorough knowledge of the offerings of the domestic market if they are to buy shrewdly in foreign lands.

As a rule buyers are usually promoted to the desirable position only after years of buying service in this country. In choosing buyers from applicants you do well to pursue the same tactics as those we described in Part I, Chapter II, and the form shown there may also be of service to you.

Some other Buying Departments. The Tracing Department. After the organization of the buying staff comes the installation of a *tracing department.* The purpose of the tracing department is, as its name indicates, to trace orders that have been placed by the

buyers from the moment that the goods are bought until they arrive.

Keeping absolute track of orders must be done because, as we have explained before, the firm must know the exact date of arrival of a consignment for the course the goods take through shipping channels is devious and extremely uncertain.

The Receiving Department. When the goods are received they must pass into the hands of a *receiving department.* The purpose of this department is to check up the goods received and see that they tally with the original order and with the invoice. Now this department and the two to follow are not really a part of the buying machine, for when the buyer has placed his order and the goods have been delivered, his work and the work of his department is done.

But as these other departments, which are needful adjuncts of every well organized business, are more nearly a part of the buying machine than any other branch, we will describe them under this heading. When the goods reach the factory or store there are three things that must be looked after and these

are (1) that they are received properly; (2) that they are distributed right and put to the proper use; and (3) that payment for them is made when it falls due.

The Distributing Department. When the goods have passed through the receiving department they are taken over by the distributing department, and, as its name shows, this department has charge of the distribution of goods to the various manufacturing or selling departments where they are needed.

The Accounting Department. And finally the accounting department must take over the bill for the consignment and attend to the payment for it. If the goods are not paid for promptly it puts the buyer in wrong and he will have a harder row to hoe in making such good terms the next time he buys.

Failure to pay promptly also weakens the firm's credit and makes close buying just that much harder. We cannot give you a detailed description here of the organization of each of these departments but we will give you somewhat of an idea of how they work from the system which is used by them.

About System in Buying. There must be

system in business to reduce the friction and keep the working parts of the machinery running smoothly. In buying it is just as important to have a system upon which the buying organization operates as it is in selling.

This system consists of a series of filing cards each of which contains certain constituent information of value to the department in its buying operations. Without such a system it is impossible for the head buyer to know just when, and in what amounts, materials and products are needed, where they can be bought, and what their market prices are.

What a Good Buying System Consists of. The first requirement of a good buying system is a method by which it can be determied just *when* the buyer must buy and *what* he must buy.

The most satisfactory way of doing this is by means of what is known as the *perpetual inventory*. In large firms where the sales of a day may clear out a complete line of stock, such as department stores, the perpetual inventory is taken daily and turned over to the head buyer as a source of buying informa-

tion. The smaller the business the less often need the perpetual inventory be taken.

Information through the Perpetual Inventory. The chief points of information that must be contained in a perpetual inventory are as follows: (1) the name and grade, or quality of the goods or material; (2) its stock number; (3) the normal maximum and minimum quantities kept in stock; (4) the dates when goods or materials were ordered, received, and disbursed, and in what quantities; (5) a balance of the data shown in No. 4; (6) the firm the goods or materials were purchased of and their last quotation or price on the same. A form of this kind is shown in Fig. 19 and it enables the buyer to keep a constant grip on the needs of his firm.

The next requisite for the buyer is a file which shows the following things about the goods or materials he must buy, viz.: (1) the name, grade, and stock number of the goods; (2) firms by whom the goods are sold; (3) quotations or prices; and (4) where the last order was placed and price it was bought at.

All of this information will be contained on

NAME AND GRADE OF ARTICLE _____ STOCK Nº _____

MINIMUM _____ NORMAL _____ MAXIMUM _____

DATE	ORDERED		RECEIVED		DISBURSED		STOCK ON HAND
	ORDER Nº	QUANTITY	ORDER Nº	QUANTITY	ORDER Nº	QUANTITY	

FIG. 19—A SOURCE OF BUYING INFORMATION—THE PERPETUAL INVENTORY

two cards as shown in Figs. 20 and 21. The object of splitting up the information and duplicating it in this way, or *cross referencing* as it is called, is so that (1) knowing what article is needed the buyer can immediately find from his files the names of its suppliers, and (2) by knowing the names of its suppliers he can get all of the information *re* its price and the terms it can be bought on.

A further advantage of Form 2 is that catalogues, price lists, and circulars from firms of their offerings can be filed in pockets containing numbers and can be quickly found. Finally Form 3 should have on its reverse side information as to previous orders placed with firms for (*a*) the goods; (*b*) prices; (*c*) quantities ordered; and (*d*) satisfactory shipment; and this is shown in Fig. 21.

System Used in the Tracing and Placing Department. So that constant track can be kept of the goods from the moment they are ordered until they are received by the receiving clerk the following system is used:

The buyer orders by means of a blank which is made out in *triplicate*, that is on three separate sheets of paper. When these three

blanks have been filled in, the buyer sends the original to the firm that is going to fill the order, he files one of the carbon copies for his own use, and the other he will forward to the receiving clerk.

The purpose of sending this copy to the receiving clerk is so that the latter can make room and be prepared to receive the goods when they arrive. This process constitutes the first step in buying, that is, in placing the order. This done, the next thing on the list is tracing the order.

How the Order is Kept Track of. When the buyer has sent the original slip out he figures that it will take a couple of days for it to reach the firm, a day for the firm to ascertain whether they can fill it, and a couple of days more for him to get a reply, or five days altogether, the time, of course, depending on the distance to be covered.

What a Tickler File is. Now the buyer has what is known as a *tickler file*, and this consists of filing envelopes large enough to hold correspondence written on business letter-heads, and to which tab fasteners are attached which have the dates of the month printed on them.

Form 3

FIG. 21—BUYING INFORMATION CARD

All duplicates of orders and correspondence are filed in these envelopes, which have in the upper corner a firm's name, and these are arranged alphabetically according to the names of the firms they are placed with. These envelopes are filed in a filing cabinet which contain drawers large enough to accommodate them and the file is *kept alive*, which means that as soon as an order has been satisfactorily filled the correspondence is removed and filed elsewhere.

The buyer consults this tickler file every day in order to see just where his buying activities stand. When the buyer places an order he puts his letter and the duplicate order blank in a filing envelope and sticks a tab on the envelope which bears a date five days in advance of the present date.

Then he has it filed in the tickler file. The filing clerk runs through this file every morning, takes out the envelopes with the tabs on them bearing the date of that particular day, and hands them to the buyer. In this way an order placed five days before is brought automatically to the buyer's notice on the day

an acknowledgment is due if he has not already received a previous reply.

If he has received a reply before the case is brought to his notice he will then, of course, be able to handle the order faster. When he receives his first reply, which will probably also give him the date the shipment can be expected, he again sets his correspondence envelope forward in the file to that date and notifies the receiving clerk to be ready to receive the goods on that date, by means of the order in triplicate.

When the date finally arrives on which the goods are due, the buyer is again automatically confronted by the fact.

If the shipment fails to show up he gets the wires busy to find out why. When finally the goods are delivered he makes a memorandum on the back of the duplicate order that they were delayed, for future reference, and adds any other data of a like nature which may aid him in placing his next order.

How the Shipment is Checked up. When the receiving clerk receives the goods he carefully checks them up, writes his tally on his

triplicate order, and signs and then returns it to the buyer for his O. K.

The buyer compares this tally with the invoice sent with the order to see that the shipment is correct in all respects. Also if any goods were damaged either before, or through, shipping, the receiving clerk notes this on the triplicate and the buyer is able to present a claim to the responsible party.

Next the goods are turned over to the stock department for proper distribution throughout the factory or store and the buyer turns over the receiving clerk's O. K.'d copy of the order to the accounting department for payment.

It will be found that this system is not only invaluable to the buying organization of your business but that it fits well into any department where considerable correspondence is used, and you will find the tickler file especially useful in your sales, credit extension, and collection departments.

CHAPTER III

WHERE TO BUY

Coöperative and Chain Methods

What Coöperative Buying Is—Coöperation for the Buyer—The Bush Terminal Sales Building—What Chain Buying is.

In the past ten years a radical change has taken place in the business world. The scheme of brutal and destructive competition which was the former basis of business has given way to enlightened and constructive coöperation and it is because of this newer and better policy that business has forged ahead by leaps and bounds in so short a time.

To be highly successful you must know about this movement and must strive to keep up with it. Now whereas competition between merchants was formerly thought to be a serious handicap to the individual it has been found to be a business builder of no mean power. In the chapter on credit information which follows you will see some of the more

specific advantages that accrue from coöperation between merchants.

Generally, coöperation between merchants will do two things, depending on the use to which it is put, and these are: (1) to lower the cost of merchandising and, hence, the price of the article to the consumer, or (2) to force sales control which, therefore, increases the price to the consumer.

As a rule it will be found in coöperative merchandising that both of these increments are used as a wedge to force larger profits. The first point has to do with increased merchandising efficiency while the second is concerned more particularly with economic conditions. Further while the first has to do with the buying operations of the merchant, the second has to do only with his selling operations. It is, however, the first point that we are chiefly concerned with here.

What Coöperative Buying is. As an example of coöperative buying here is a simple little word-picture from life which not only illustrates the principles involved but also the advantages that accrue from it.

A bright young salesman who wanted to

increase his capital hit upon the following live scheme. He organized a company the purpose of which was to distribute groceries to retailers on a profit-sharing or coöperative basis. The par value of the stock in his company was $40.00 a share.

Next he found a wholesale grocery concern that agreed to sell him at a lower rate because by so doing it was able to eliminate in so far as his customers were concerned a large selling force and hence to lower the selling cost of the groceries. This done he went to a large number of retail grocers to whom he put up the following proposition. They were to place their orders for groceries through him and this they were quite willing to do for it enabled them to buy cheaper.

He also proposed that they buy stock in his company at $60.00 a share and in this way they became members of the concern from which they bought. In other words they would be buying from themselves and would consequently split the profits which the company made between themselves.

The extra $20 a share above par which the stock brought was for the maintenance of

the coöperative concern while it was getting on its feet. Obviously the more members such a concern had, namely, the more stockholders, the greater the advantages each individual grocer received. The result of it was that he had no difficulty in disposing of the entire issue of stock and he prospered and so did the retail grocers.

It was not long, however, before other wholesale grocers began to *knock* the game to the retailers and, naturally, a few of them wrote in and complained. To these foolish ones the young man promptly returned their money together with a letter showing them how the concern was saving them money. Finding he was willing to return their money, almost without exception they sent it to him again.

His scheme was a success because it was formed on the right coöperative basis. The reason it had not been done before was simply because of the inertia that had to be overcome in order to get it under way.

Briefly the coöperative plan enabled the members of the organization to do the following things: (1) to *buy cheaper* than merchants who were not members of the organization;

(2) to *share in the profits* of the concern selling the groceries to them; and (3) to *sell at a lower price* to the consumer if they were so minded and thus increase the volume of their business.

Coöperation for the Buyer. We have already given you the principles of expert buying and shown you how to organize a good buying force. In fact we have told you everything except where to buy. Now there are two chief ways in which the merchant buys his goods and these are: (1) from manufacturers' and jobbers' salesmen who go to see him, and (2) through his buyers whom he sends to the big cities.

Manufacturing and jobbing salesmen are always traveling throughout the country and call on you in the course of their journeys, or letters sent out to manufacturers or jobbers stating your needs will bring a raft of salesmen and samples. Buying done in this fashion is very easy but it is by no means the best way, for you are limited in your selection of stock to the materials brought to you.

The progressive retailer operates a little differently for he sends his buyers to the big cities where are located the biggest manu-

facturers and jobbers in all lines. Once there, the buyer looks around the city until he feels that he has seen everything that is worth while in his line and then he make his selection.

In this way the buyer is able to buy to a much better advantage than he can from traveling salesmen, for it is easy to make a comparative selection that is limited only in its scope by the time, money, and energy he has at his disposal.

But there are drawbacks even to this method of buying and chief among them are: (1) the manufacturers are not centralized and hence much time and energy is wasted by the buyer in gaining a superficial knowledge of what the market affords, and (2) because of this lack of centralization the exact comparative values of the articles the buyer looks at are likely to be lost and this again is a hinderance to good buying.

Obviously what is needed and must be had in order to buy expertly is some kind of a highly centralized, nay, concentrated, mart in which the comparative samples are displayed so that the latter will be under the buyer's

eyes all at once and without his having to chase from one end of the town to the other. See Fig. 22.

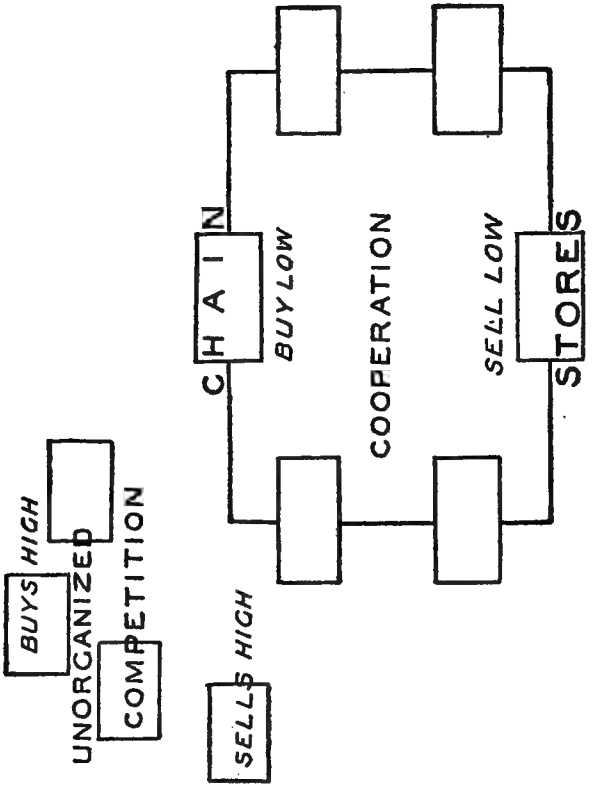

FIG. 22—WHY CHAIN STORES ARE SUCCESSFUL

The Bush Terminal Sales Building. This great edifice, which is twenty-eight stories high, is a veritable merchandising paradise

for the manufacturer, jobber, wholesaler, retailer, and last, but greatest of all, the buyer. It is located in the central part of New York City.

On the first two floors are located the *International Buyers Club*, grill room, and library. All buyers automatically become members of this club and there are no dues or fees. Its object is to provide a luxurious and restful place for the buyer to transact his business and do his work in.

The library is one of the most unique in the world and the most complete of its kind. You will find in it every trade paper, merchandising books, offerings, price lists, a foundation library of fashions, and the developments of dress both for men and women from the last tick of the watch back to the fourth century A.D.—an invaluable aid to the designer and buyer of apparel and a statistic service that will give him ideas of advertising, financing, buying, and selling that are worth their weight in platinum.

There is also in the library a card-file which gives a complete and up-to-minute description of all the lines of goods displayed in the

building. This service gives the buyer an airplane view of the market in tabloid doses that he cannot get in any other way. Through these sources of information the buyer can buy easier and better than by any other plan.

Above the Club are twenty-four floors of display booths and rooms containing the largest assortment of varied merchandise offerings ever gathered under one roof.

These booths and rooms are rented by manufacturers, jobbers, and wholesalers to display their wares in. These rooms are outfitted in the latest approved methods with display cases and furnishes high-grade salesmen to take charge of them.

This plan is not only a boon to the manufacturer or jobbers, as the coöperative plan lowers sales costs to a minimum, but to the buyer as well, for it places a half dozen competitive articles under his gaze at one time with the result that his comparative selection is bound to be the best. In fact the whole secret of this kind of organization can be summed up in two words, namely *coöperative service.*

What Chain Buying is. There is still another device used by the successful merchant

which cuts down his merchandising costs and enables him to sell more cheaply. This is the chain-store plan. As the name indicates it consists of a chain, or series, of stores all under one ownership, which may be individual, partnership, or corporation.

In this plan there is the additional advantage in that there is no competition of any kind between the stores. It is an old saying that "competition is the life of business." Not so, for the chain stores have proved to be highly successful and this is a case where co-operation only exists. First-rate examples of chain stores are the Liggett Drug Stores, United Cigar Stores, and the Butler Grocery Stores.

The following advantages are obtained where chain stores are run, namely: (1) they permit of quantity buying and hence cheap buying; (2) the returns on large quantities of merchandise so purchased are almost instantaneous because of the large capacity of the chain of stores for distribution to the consumer. In other words the turn-over of capital is quick and hence the business is always kept a live issue.

Possibly by considering these modern plans of merchandising, which enable the operations of buying and selling to be conducted so much more profitably, you will see how you can apply them to your business.

Part III

Commercial Confidence

CHAPTER I

CREDIT AND YOUR BUSINESS

Confidence in Days of Yore—In the Stone Age—The Barbaric Norsemen—The Hudson Bay Company—What Credit Is—Various Kinds of Credit—About Personal Credit—What Retailer Credit Is—On Manufacturer Credit—Bank Account Crediting—Why a Credit Organization is Needed—What the Credit Department Does.

IN the natural course of events you will find that the keystone of all business transactions is *confidence*, and without this dominating factor business cannot be conducted, for at some stage or other it becomes necessary for one party to trust the other.

Confidence in Days of Yore. In days of yore when might was right and the stone-age man held sway he clubbed his neighbor half to death and relieved him of whatever it was he wanted, hence, quite naturally, confidence was an unknown quantity.

A few thousands of years later when the barbaric Norsemen gathered to barter, the bargain was sealed by the ceremony of drink-

ing from what we are now pleased to call a *loving cup*. But so great was the lack of confidence even in these days that the cup was provided with three handles to one of which the drinker held. Before he drank however he

FIG. 23—THE LOVING CUP AS AN AID TO BIG BUSINESS

insisted that his supposed friend and business associate grasp the other two handles of the cup to the end that the latter might not stick him between the third and fourth ribs and take his due from him. The idea is represented in Fig. 23.

Certainly under such untoward conditions

the art of doing business could not be expected to thrive overmuch. But as the centuries rolled on the confidence of men in one another grew stronger and ever stronger, especially in matters pertaining to business, chiefly because laws were laid down to prevent and punishments meted out to those who were guilty of business treachery.

Even in the early history of the North American continent a large amount of confidence had manifested itself between the pale face and the poor Indian and, strangely enough, it was rarely abused. In the frozen North the Hudson Bay Company which traded in furs depended on the red men for their catches. At certain advantageous points the company located its factories, as the trading posts were called.

At these posts any Indian who had not been proved to be a thief would be *staked* to an outfit of a hundred dollars' worth of provisions; that is he would get it on tick, jawbone, or *credit* as it is called to-day, so that he might penetrate into the wilds and trap for the company. At the end of six months the *honest Injun* would return with his catch and liqui-

date his debt. This confidence between the pale face and the red man is pictured in Fig. 24.

The *factory* was in charge of a *factor*—hence its name—and it was he who judged the In-

FIG. 24—CONFIDENCE BETWEEN WHITE MAN AND SAVAGE

dian's honesty and just how much credit he could *safely* let him have. By extending this credit to the savage he enabled the latter to carry on his *business*, which was that of trapping, the only consideration being that he sell his catch of furs to the factory or company.

Thus the factor of the Hudson Bay's trading post was the original counterpart of the factor

who advances credit in modern business transactions so that the debtor can carry on his business, and, of course, the former exacts a commission in return for this service.

What Credit Is. From this little historical sketch you will gather that *credit* is simply *business confidence*. There are certain things, though, that the advancing of credit does which you should know about in order to have a clear conception of the nature of this kind of a trust.

The first and most obvious thing that credit does is to lessen the value of money. As an illustration of this point let's take a community in which credit is taboo. To be able to buy in such a community you must have the ready cash. This, of course, means that there must be more actual currency, that is money, in circulation in this community than in one where credit is liberally extended.

It follows, then, that the greater the need is for actual cash the greater value it has, that is to say, the greater is its purchasing power. In communities where credit is liberally extended the need for cash is less and consequently the power of money is less. From these

facts an extremely simple and self-evident axiom can be formulated, viz., to *make your money buy the most, buy with cash.*

And since it is a poor rule that doesn't work both ways, here is a corollary that has been recognized and heeded by merchants all over the world ever since business was invented, viz., *to make your goods bring the highest prices sell on credit.* Man's greatest weakness in buying is credit, for buying goods on trust blinds him to the defects and real values of them and it is one of the greatest selling arguments ever used.

On the other hand it must be cleverly handled by the merchant or it will prove to be a Little Old Man of the Sea and finally strangle him to death. The purpose of this chapter is to give you an insight into the nature and operation of credit that will enable you to employ it successfully on both the buying and selling ends of your business.

Except when properly handled credit is a detriment, instead of a boon, not only to the debtor but to the creditor as well, as you will presently see. In spite of the dangers that attend it there are reasons for its use

which make it at times a legitimate necessity.

Why Credit Is Necessary. There are several reasons why the propagation of credit is a good thing and these are (1) it enables the consumer to buy the necessities of life during such time as he is waiting for his pay envelope. At some stage or other the consumer through needful but unexpected expense may get behind in his ability to pay.

More often though it is through his extravagance or mismanagement that this happens. The credit extended to him by his local merchants enables him to live and catch up where otherwise he would have to starve and so incite him to steal, or to start a revolution. Credit is not only a good thing for the consumer therefore but it helps to balance things and keep the poorer population from social unrest.

It also works for the good of the merchant for should he refuse credit to a customer when he needs it, he will not only lose his customer's trade during the period in which he is hard-pressed but what is worse, he will lose it for all time. A customer who is once refused credit when he actually needs it will naturally

trade elsewhere when his finances pick up again.

(2) In virtue of the fact that he must extend credit to the consumer the merchant is often placed in a position where his outstanding debts force him to seek credit himself so that he can carry on.

Again, and this is good for him, credit enables him to buy advantageously because he can lay in a stock of merchandise before the season opens for its sale. In this case he does not need to make the large outlay of money that he would have to if he waited to buy until the season opens and he actually starts to realize on the sale of his stock.

Since he is selling in a highly competitive market he must sell for smaller profits; for this reason he must work on a closer margin and turn his capital over oftener if he is to keep his head above water, and credit permits him to do this.

(3) By using credit he can carry on his business even though he does not have the ready capital at the time and this without endangering his independence; and this is true not only of the merchant but of the wholesaler, jobber,

and manufacturer as well. Without credit there would come a time when these organizations would be financially crippled if indeed they could exist at all.

(4) The final advantage of credit is that it is a more convenient means of payment where large sums of money are involved, in many cases, than the actual currency itself would be.

Especially is this true where long distances are concerned. Further since it is a means of payment it can be used to supplant or take the place of currency to a certain extent. Just how this pleasing operation is effected you will presently see. But to understand this you must know something of the various kinds of credit that are utilized in the business world.

Various Kinds of Credit. Now there are many different ways and means by which credit is extended but all of them can be resolved down to a couple of basic classes and these are (1) *short time credit* and (2) *long time credit.*

Short time credit, as its name implies, ranges from the ordinary *sight draft*, or *demand note* which is to be paid upon sight, or demand, to the longer thirty-day *promissory note*, that is,

a note which states that you merely promise to pay thirty days hence.

Another means by which credit is gained is by making payment with a *city draft* drawn on a neighboring city bank and to which the draft must be sent in order to have it cashed. Thus if Brown gives Jones a draft on Boston, both being in New York, by the time the latter deposits it in his bank, it is sent to Boston for collection, payment is made there and returned to Jones's bank in New York, six days have elapsed, Sunday being a holiday makes seven, and then the law allows three days' grace, making in all ten days' credit for Brown, who doesn't even have to ask Jones for it.

Long-time credit runs anywhere from thirty days on up to infinity. Credit of this kind is, however, seldom extended over a longer period than six months for the three following good reasons, namely, (1) if the debtor is still unable to pay after such a long time the chances are he will never be able to do so, and you must bear in mind that the longer time you grant credit for, the greater the risk you are taking with your money. (2) The longer the time that elapses, the harder it is for the credi-

tor to determine future events, that is what is likely to happen. (3) And, finally, it is necessary for the creditor to turn his capital over just as often as it is for the debtor in order to keep afloat. To extend credit over a period longer than six months is generally unwise unless there is ample security to back it up.

The two above classes of credit can be further divided into four distinct kinds and these are (a) personal credit, (b) retailer's credit, (c) manufacturer's credit, and (d) book account credit.

About Personal Credit. Under this heading falls every kind of credit that is given the individual on his *personal security*. The greatest of all personal credit businesses is the extension of credit to the consumer by the merchant.

There are numerous and divers means by which this is done and they range anywhere from the unwritten and usually unspoken, *i. e.*, tacit, agreement that the housewife makes with the butcher, the baker and candlestick maker to the more formal and hard and fast agreement with the installment house.

As we have pointed out before, credit is a

mighty good thing, *per se*, for both the consumer and the merchant when it is handled judiciously. Unfortunately its advantages are too often offset by the abuse of both the merchant and the consumer. Since man's greatest weakness is buying on credit, the consumer, if permitted, will very often run himself into unredeemable debt.

We say *unredeemable debt* because of the fact that all too frequently the merchant allows the consumer to buy far beyond his credit value either because (a) he is carried away on the tide of the big business he thinks he is doing or (b) he is fearful that if he does not keep on extending credit he will offend the customer and lose his trade and the chance of collecting what is already due him, in which case he is between the devil and the deep blue sea.

But sooner or later the tide reverses its direction, low ebb takes place and a day of reckoning is at hand for both. The consumer is unable to liquidate his debts and such payment as he does make usually leaves him stranded. The merchant's business then begins to feel the effects of his poor credit policy for his books show nothing but a balance of

bad debts. He in turn finds it hard if not indeed impossible to get the credit he needs to tide him over.

In this way a center of financial depression is formed in the wheel of the business and as it grows larger it works nearer and nearer the rim until it overbalances it. To counteract this untoward result the merchant must needs *boost* his prices and in the finality of things mundane it is the consumer upon whom the full burden of this folly falls.

What Retailer Credit Is. In this chapter we have been using the term merchant to mean the *retailer* and we have now come to the granting of credit to the retailer, or merchant, by the manufacturer, jobber, or wholesaler.

The retailer, as we have previously pointed out, can seldom afford to buy very far in advance of the time when he can sell to the consumer unless some special inducement is made him and the one that appeals to him the strongest is credit.

The plan most commonly used for granting the retailer credit is that known as *advance dating*. In this plan the bill of sale is dated from 30 to 60 days in advance of the actual

date of shipping, and 2% is discounted, that is, *knocked off* of the total amount of the bill if payment is made within 10 days' time from the date of sale.

This gives the retailer ample time to receive his goods, prepare his displays, and start his actual selling campaign before the payment falls due. On the other hand he has the privilege of raising the money and paying the bill within ten days and in the event of his doing so he gets the benefit of the 2% discount, and where a bill runs into hundreds or thousands of dollars this discount is not to be ignored.

From this you will gather that credit must be paid for and that the retailer is not exempt from such payment. But 2% is in reality a very small percentage to pay for credit for there are many other kinds of credit in which the payment exceeds 10% as you presently see.

The advantage of the retailer credit plan is that it enables the manufacturer or jobber to sell to the merchant without delay, and likewise, it enables the merchant to lay in a season's stock and prepare it for sale without the initial outlay of a large sum of money which might

tend at the time to cripple his activities in advertising and the sale of the goods. The jobber is extended credit in the same fashion or he gets it through other channels as you will also see further on.

Manufacturer Credit. It is often desirable for a manufacturer to have credit granted him by dealers in raw materials and machinery. This is done either through advanced dating as described above or through what is known as the *book account plan* which we will describe later on.

As an example of the desirability of credit to the manufacturer let's take a newly organized firm starting in to manufacture an automobile accessory. Without credit it would be necessary for the firm to have on hand an enormous amount of cash with which to buy raw materials, machinery, housing, and advertising. But by means of credit the firm can bring its business up to the point where it is able to turn its capital over quickly, and pay off its creditors quickly without embarrassment and all on a very small initial outlay.

Book Account Crediting. A kind of credit that is offered to substantial firms is known as

book account credit. The books of a firm show the nature and the amounts of the credits owed it, that is whether they are good or bad.

Now when the percentage of bad credits is small a firm can raise money on the strength of these book accounts through a commission house, brokerage firm, or factor,[1] and the procedure is as follows: The firm assigns its *book accounts* over to its creditor who allows it to withdraw a large percentage of the credits shown, usually from 75% to 90%.

The money is then advanced to the firm, minus 10% to 25% commission. The size of the commission charged depends on the risk the creditor is taking and this of course is based entirely upon the nature of the credits in the book account they are buying. In other words this is a case where the firm is not *borrowing money* but where it is *selling its credits*, *i. e.*, uncollected accounts for cash at a large discount.

As you probably know, in many States it is illegal to loan money at a higher rate of interest than 6%. Any amount above this percentage becomes what is known as *usury*.

[1] Factors are now called *mercantile bankers.*

Since, however, the book account plan is not a loan plan but a buying plan it is not illegal in the eyes of the law though it is nevertheless a form of credit.

Banks hardly ever charge more than 6% on loans but in virtue of the speculative nature of book accounts they are prohibited from making loans on them. Of course there are times in the existence of a firm when it must obtain large sums of money in order to keep things going, and when these conditions arise a high rate of interest is a secondary consideration.

Why a Credit Organization is Needed. We have told you that the way to make your goods bring the highest prices is to sell them on credit, but at the same time we have shown you that unless your credit dealings are well systematized and organized you will more than likely come out at the little end of the horn.

Hence, to operate without loss, you must establish a credit department and to do this you must have a thorough knowledge of the functions of a credit department and its sources of information all of which is described in the following chapters.

What the Credit Department Does. The

chief functions of a credit department consist of three determining features, namely, (1) the ability of the applicant for credit to liquidate the debt when payment falls due, (2) the intention of the applicant for credit to liquidate the debt when payment falls due, and (3) the future conditions upon which the applicant's ability to liquidate his debt when payment falls due.

The estimate of the applicant's ability to liquidate his debt is based upon the security, collateral, or attachable property which is actually in his possession. This serves two purposes namely, (a) you can judge to some extent by the applicant's visible signs of prosperity whether he will be able to liquidate the debt when called upon, and (2) if the applicant has sufficient property or security, in case he fails to liquidate his debt either in full or in part, that can be realized through this source.

The estimate of the intention of the applicant is one of the most important determining features a credit department is called upon to make. When a debtor fails for any reason to liquidate it, it involves the expense of much

time and money to realize on the security and sometime this last chance of realization fails.

What you want to know then is that an applicant for credit is honest and firm in his intention and determination of liquidating his debt. In the determination of this factor a complete record of past performances in liquidating his debts, and of the reasons which make it necessary for him to seek credit are invaluable.

Clearly an applicant, who has failed to make good his credit in the past, or whose reasons for wanting credit seem questionable, nay fishy, is not to be trusted unless his security is of the highest order, and amply sufficient to cover the amount of credit which he is seeking.

And, finally, the determination of the future conditions upon which depend the applicant's ability to liquidate his debt must be taken into consideration. Very often a man, or a firm whose intentions are the best in the world is unable to make good the credit extended to him, because of the financial stringency that has been caused by some unforeseen turn of the wheel of fortune.

Evidently it would be poor policy to extend credit to an applicant if your credit depart-

ment has concluded that the applicant's securities are unsound or that he is liable to fail at any time for any one of a dozen reasons. All of these determinations are absolutely necessary before credit of any kind can be granted. But to safely extend credit you have got to delve deeper into certain points concerning the applicant, or his business, or both.

When you grant credit you must not only know the liability but the reliability of the applicant, also the amount of business he has done, the status of his book accounts, outstanding debts, suits, etc., the ability of the heads of the firm to cut down expenses, the rapidity of turn-over and all the other little pro and con points.

In Chapter III, Part III, you will learn exactly how to obtain all of this inside information and just how your credit department makes use of it in analyzing the desirability of granting credit to an applicant. "Nearly all is brass that glitters" and this is especially true in the business world; consequently you must have an active and intelligent credit department if your firm is to conduct a credit business and still make a profit.

CHAPTER II

INSIDE CREDIT INFORMATION

The A. B. C. of Credit Information—How Credit Information is Obtained—The Direct Method—Credit Reporters—Property Statement Blanks—In the Indirect Method—The Salesman as a Credit Sleuth—Credit Information through Lawyers—The Record Searcher—Newspaper Clippings—Credit Information from Banks—Credit Information from Other Firms—Credit Information Agencies—Coöperative Credit Organizations—National Association of Credit Men—Collection Bureau—Legal Bureau—Adjustment Bureau—The Analysis of a Credit Statement.

As you know the three chief functions of a credit department are to (1) collect credit information, (2) systematize the information thus collected, and (3) discover by means of the collected data what individuals, firms, companies, and corporations are and are not good credit risks.

Not only must a credit department collect such information at the time it receives an application for credit but it must get hold of a large and varied assortment of such information as will come in handy for quick reference

in the future. Nothing is too small, or too large, for the credit department to gather into its information files that has any bearing on credit relations of the past, present, or future.

The credit department of a firm can be likened to a detective bureau but it operates for the prevention and discovery of credit crime; like the detective bureau the information obtained by the credit sleuth must be carefully assimilated and classified by the master mind of the credit man so that from it he can deduce his conclusions correctly.

The A. B. C. of Credit Information. To be of value credit information must first of all be intelligent, that is it must contain certain information that is at once definite as well as truthful.

Now the A. B. C. of credit information is *assets*, *business*, and *character*. With complete and reliable information concerning these three fundamental points the credit man can build up a credit system of unfailing accuracy. Included in the information on assets there must be a complete statement of the applicant's financial standing which, of course, includes his liabilities as well.

The information on business contains data on the capacity of the firm or house, that is, whether or not it is a going concern. Character information is based on the moral character and responsibility of the individual or firm applying for credit and is of course based on past performances.

How Credit Information is Obtained. There are two chief ways in which credit information is obtained and these are (1) the direct method, and (2) the indirect method.

Again there are two principal sources through which the credit department can obtain this information, namely (a) through the efforts of its own staff, and (b) through some outside agency from which the information is bought, or exchanged, as the case may be.

For the present, however, we will consider the ways of obtaining credit information and these are the same no matter what the source may be.

The Direct Method. There are, however, two schemes for obtaining direct credit information, that is to say, information gained directly from the applicant for credit and these are by (1) what are known as *credit reporters*,

and (2) what are called *property statement blanks.*

Credit reporters, who belong to the firm that is asked to extend credit, go the rounds and personally interview the applicant for credit. This is a fairly reliable means of obtaining credit reports for the applicant can be interviewed in his natural environment, *i. e.*, his home, store, or factory surroundings.

In this case the reporter can draw his conclusions from the condition of this environment that are more or less enlightening to the credit man. Suppose by way of illustration that your reporter interviews an applicant for credit in his store. The applicant states that he has a going concern and that his business is rapidly increasing.

The reporter, on the other hand, sees every sign of inactivity, poor organization, and but little system. These observations noted on the report enable the credit man to discount the applicant's statement and he takes it at its true and not at its face value.

In granting the consumer credit his home can generally be taken as a fair indication as to his stability and credit worthiness. For

instance a man whose income is known to be small but who lives in a palace can be taken usually as running his credit far and wide in order to do so. In a word he is unreliable.

Thus in a thousand and one ways it is possible for the reporter to observe things that agree or disagree with the applicant's statements and which in consequence either bear him out or give him the lie direct.

The second means of obtaining a direct report on the applicant's elegibility for credit is the property statement blanks and this is sent to the applicant to be filled out by him. These blanks can be bought from dealers in business stationery or from loose leaf manufacturers, and is the standard form adopted and recommended by the *National Association of Credit Men.*

As this blank is reproduced in Fig. 25, it is not necessary to go into a detailed description of it, suffice it to say that when it is accurately filled in it provides a source of credit information from which the credit man can pretty closely determine the reliability of the applicant.

In the use of these statements, however, there

are a couple of things that must be taken into consideration. The first is the wilful misrepresentation of facts by the applicant, and the second is the unintentional misrepresentation of facts by him.

Wilful misrepresentation is the least frequent of the two, for the credit shark, who was formerly addicted to this vicious habit, has had his teeth pulled by the legislation of a law which penalizes the act of giving false written statements in order to obtain credit. This being true the credit shark never knows when he is going to be picked up for this offence and prosecuted.

Unintentional misrepresentation is of common occurrence. It happens where the methods and systems, if there are any, in use by the applicant are so antiquated or lax, or both, that even if he is a church member, it is quite impossible for him to make an accurate statement. Moreover, this is the cause that usually lies behind his application for credit.

You will find on careful investigation that such an applicant wants far more credit than he is entitled to and hence, when such misrepresentation is found to have been made, it is not

PROPERTY STATEMENT BLANK

ADOPTED AND RECOMMENDED BY THE NATIONAL ASSOCIATION OF CREDIT MEN

For the purpose of obtaining credit and to induce you to sell me (us) merchandise, I (we) make the following statement in writing, intending that you should rely thereon respecting my (our) financial condition

ASSETS	Dollars	Cents	LIABILITIES	Dollars	Cents
Cash on hand			OWING FOR MERCHANDISE On open account not due		
Cash in bank			On open account past due		
ACCOUNTS owing from customers collectible			On notes and acceptances payable		
NOTES owing from customers collectible			OWING FOR BORROWED MONEY To bank		
			To others		
Merchandise, (How valued: Cost or Market)			Owing for rental		
Fixtures and equipment			Owing for wages and salaries		
Land and buildings as described below			Owing for taxes		
Owing from members of firm, employees and others not customers			Owing on land and buildings		
Other Assets			Other debts to relatives and others		
Total Assets			Total Liabilities

LOOSE LEAF MFG. CO., CHICAGO 8M10-12

FIG. 25

prudent to grant credit at all unless it is on readily convertible security.

The first thing that the credit man must see before granting credit to an applicant, whether individual, firm, company, or a corporation, is the *balance sheet* and this should be *certified* by a *public accountant* so that you will know it is correct. From the balance sheet the credit man will be able together with such other information as he has on hand to make an accurate analysis of the firm's credit reliability.

A condensed balance sheet of the *General Motors Corporation* for 1918 is reproduced in Fig. 26, and you can see the kind of information that it contains and this is typical of all balance sheets. Now while we are assuming in this chapter that you are the man who is extending the credits you will do well to heed all of the points which we have set forth when you seek credit yourself.

You must agree that if you have the right to know on what basis other firms are asking you for credit, they have the same right, when the tables are turned and you are the applicant, to know yours. When they are furnishing you with capital for a given period to do business

ASSETS	December 31, 1918
Permanent Investment:	
Real estate, plants and equipment	$ 86,818,414.51
Less: reserve for depreciation	10,061,983.38
	$ 76,756,431.13
Investments in allied and accessories companies	2,839,531.23
Current and Working Assets:	
Cash in banks and on hand	30,636,621.48
Liberty Bonds	28,852,018.00
Marketable securities	172,304.86
Sight drafts against B/L attached	3,316,384.90
Due from U. S. Government on war contracts	7,305,626.76
Notes ($1,285,908.01 in 1918) and accounts receivable	21,995,359.50
Inventories at cost or less	91,137,512.59
Total Current and Working Assets	$183,415,828.09
Deferred expenses	762,651.85
Good-will, patents, copyrights, etc.	35,714,893.43
Total	$299,489,335.73

LIABILITIES	
Capital Stock:	
Debenture stock (authorized $150,000,000) issued	$ 30,756,300.00
Less: in treasury of General Motors Corp.	1,581,000.00
In hands of public	$ 29,175,300.00
Preferred stock (authorized $20,000,000) issued	$ 19,684,300.00
Less: in treasury of General Motors Corp.	13,300.00
In hands of public	$ 19,671,000.00
Common stock (authorized $200,000,000) issued	$151,301,100.00
Less: in treasury of General Motors Corp.	3,921,200.00
In hands of public	$147,379,900.00
Total in hands of public	$196,226,200.00
Purchase Money Bonds	225,000.00
Outstanding Capital Stock (par value) and surplus of subsidiary companies, being portion not owned by General Motors Corp.:	
Capital Stock	$ 2,960,400.83
Surplus	427,754.20
Total	$ 3,388,155.03
Current Liabilities:	
Accounts payable	$ 18,453,316.99
Notes payable	10,802,154.11
Taxes, pay rolls, and sundries accrued not due	3,769,865.29
Total Current Liabilities	$ 33,025,336.39
Reserves:	
For two months' proportion of Dividend on Preferred and Debenture stock, payable February 1	$ 488,463.00
For Federal taxes and extraordinary expenditures	25,863,823.23
For sundry contingencies	3,863,420.65
Total	$ 30,215,706.88
Surplus	36,408,937.43
Total	$299,489,335.73

FIG. 26—ANNUAL STATEMENT OF THE GENERAL MOTORS CORPORATION

on, and for your profit as well as their own, they want to know what use you intend to make of it and that you will pay it back.

The Indirect Method of Getting Credit Information. As you have seen we used the term *direct method* to mean that the applicant himself knowingly supplies the credit information needed, and by the same token we use the term *indirect method* to mean that the applicant is unaware that credit information is being obtained.

There are in all six ways by which credit information is uncovered and these are important for one or more of them can be taken as a means of *verifying* the direct information obtained from the applicant. Named, these ways are (1) through salesmen, (2) through attorneys, (3) through record searchers, (4) through newspaper clippings, (5) through banks, and (6) through exchanges for credit information.

The Salesman as a Credit Sleuth. The salesman makes an excellent sleuth providing you have faith in his intelligence and integrity. Since it is impossible for the salesman to give a customer a direct interview relating to credit

conditions without interfering seriously with his selling activities, you provide him with

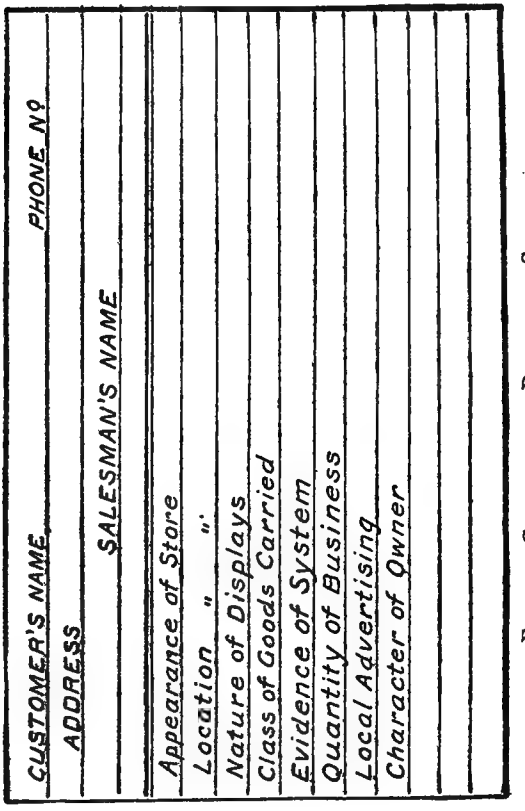

FIG. 27—CONFIDENTIAL REPORT OF SALESMAN

cards on which to report such information as he may gain in an indirect manner and which consequently does not hurt his sales.

One form of these cards is shown in Fig. 27

and it is self-explanatory. The salesman fills out his card unknown to the customer and encloses it with his sales report card to the sales manager who in turn refers it to the credit manager.

This form is an admirable check on the direct statement made by the customer when he applies for credit but unfortunately it has two loopholes in it and these are (1) the information is rather superficial and insufficient, and (2) some salesmen have the bad habit of letting the customer fill in the card to gain his good will and get his big order. However, it is a scheme that serves to give the credit man a line on the customer, and further it is a means of obtaining credit information that comes in regularly and costs nothing.

Credit Information through Lawyers. A very good way to get credit information about an applicant is through an attorney who lives in his home town. This is especially so in the smaller towns, where an attorney has an opportunity of keeping his finger on the business pulse of the community.

He can give you reliable information as to the past and present market conditions and the activities of the applicant and he can make

a fairly accurate estimate of the future outlook of affairs. Also he is fitted to give reports on the legal aspects, including litigations of firms in his locality, and for such services his charges are only nominal.

The Record Searcher. Another valuable source of information at the disposal of the credit man is the court records of suits, attachments, infringements, bankruptcies, and incorporations. This kind of data is mighty good to use as a check on the direct statements made by applicants.

While this information can be had through the services of your special record searchers it is at the same time better to let the local attorney dig it up, for, as we have said before, he is peculiarly well fitted to present it to the credit man in a manner that will be of the greatest value to him.

Information Gained through Newspaper Clippings. A large amount of information on the financial and legal activities of applicants for credit can be had from newspaper clippings. The financial columns of newspapers contain daily accurate reports on market conditions in every field of merchandising.

Much definite information can also be obtained on credit accounts that the department is handling at the time or expects to handle in the future and this information can be clipped and filed for reference. A *press clipping bureau* will furnish the credit department with clippings at a low cost and this is better than a clipping service conducted by the credit department in that it clips from a far larger number of publications.

Credit Information from Banks. Credit information can also be obtained from banks and although this is an indirect means of getting it, still it has some of the disadvantages of the direct means. Where a bank does a large business with a firm it is apt to be more liberal in its credit estimates than a disinterested reporter would be. But bank reports are useful in conjunction with the reports from other sources.

Credit Information from Other Firms. Finally an excellent source of credit information is that of other firms with whom the applicant for credit has or has had dealings. From these sources it can be determined how much risk is taken in granting credit by securing a complete

record of his credit dealings in the past and studying it from this viewpoint.

Many firms and particularly those who are members of the National Association of Credit Men will swap information of this kind with you and we reproduce in Fig. 28 a blank for the purpose of exchanging such information which is the form approved of by the Association.

Credit Information Agencies. The sole business of *credit information agencies*, or *mercantile agencies* as they are called, is to provide firms that buy their services with information on applicants for credit. As a rule they are only employed where a firm has no credit organization of its own. In general the methods employed by mercantile agencies are those just enumerated for getting credit information.

The reports sent in by these agencies contain three important items of intelligence and these are (1) information gathered through ordinary channels on the credit responsibility of firms in general, (2) general deductions of the agency relating to markets and business fields of endeavor, and (3) special reports on specific firms applying for credit.

While the cost of this kind of agency service is far less than that of keeping up a credit de-

Chief among the latter are: (1) They are slow, (2) information is not always as full and exact as it ought to be, and (3) they are not

sufficiently organized. To obviate these difficulties a new and better system of supply credit information has come into use.

Coöperative Credit Organization. This recent and more intelligent scheme of service consists of *coöperative credit organizations.* These organizations had their origin in the clubbing together of the credit departments of a few firms for their mutual protection and welfare.

In its simplest form these organizations merely swap credit information and this enables the credit department of any one firm to get more intelligent service and at the same time get it quicker and cheaper. In its more recent development a central credit office is established for all members of the organization and full information concerning all the credits established is kept there where it can be obtained by the members from time to time as it is needed.

In its present form of organization this system has decided advantages over the mercantile agency for it places at the disposal of any of its members all of the transactions of the other members among themselves and also

with outsiders. This furnishes a very thorough means of determining credit reliability through past performances.

Moreover the pooled interests of such an organization make it possible for you to obtain credit information very much cheaper than can be done where an individual credit information department is used. The more members admitted to such an organization the greater the amount of credit information that is available and hence the less is the expense of the individual member in securing the information he wants.

It is simply another case of where coöperation makes for economy and hence for success, and this is all the more true where the members of a coöperative organization are hot competitors. It has been found that in modern business the old and small time policy of putting every stumbling-block possible in your competitor's way doesn't work.

The National Association of Credit Men. The best coöperative credit organization in the United States is the *National Association of Credit Men* which is located at 41 Park Row, New York City. As its name indicates its

scope is *national* and this makes it highly useful to its members.

Briefly stated its aim is the coöperation of every credit organization whether privately or coöperatively owned in the United States, and the building up of conscience and confidence in business. It has a rapidly growing membership of over 23,000 representative credit departments and all of these work in the interest and protection of their fellow members who comprise manufacturers, wholesalers, jobbers, and bankers.

A membership in the *National Association of Credit Men* brings to you all the coöperation and information on credit that the heads of the biggest credit men in this country can supply you with. Since the *Association* is a national organization it is strong enough to have legislation enacted for the protection of its members against the credit swindler, and in this respect it has been eminently successful.

It has also supplanted the guesswork formerly attendant upon making credit extensions with certainty of results. The *Association* maintains a *legal bureau* which furnishes without cost to its members opinions on legal

points that arise in the extension of credits. It also stands for friendly adjustments and its *adjustment bureau* offers every facility for making such adjustments where misunderstandings have sprung up, and this without breaking the long and hard built up chain of credit relationship.

But the greatest advantage that it offers to you is that its moral effect on the debtor is far reaching. The fact that your debtor's credit relations with you are the common property of some 23,000 other firms tends to make him straightforward and above board in his dealings with you and with your fellow members whether he is honest at heart or not. He knows that to break faith with you is to lose his reputation with all the other members of the *Association* many of whom are possible sources of credit.

The Analysis of a Credit Statement. A credit statement, either direct or indirect, must be carefully analyzed by the credit man before he can reach a definite conclusion as to whether an applicant is entitled to credit or not. Every item of a statement must be carefully weighed against the business situa-

tion in so far as it relates to the applicant, in order that the credit man may determine if he is warranted in extending him credit.

The first thing that must be done in analyzing a direct credit statement is to discount it at its real value. In discounting statements you will be safe if you follow these rules, namely, (1) discount 50% on all goods whose actual value is vaguely or indefinitely shown, or whose value is variable; (2) discount 10% as an allowance for shopworn, defective, and depreciative stock; (3) discount 10% for wear, tear, and depreciation in value on machinery; (4) discount 10% on notes and accounts held as a reserve for bad credits; and (5) discount 20% on open book accounts.

If now the assets still exceed the liabilities after this fair discounting of values you can then safely grant credit in proportion to the excess. See Fig. 29.

When analyzing a statement you must make sure (a) that the current and working assets of the applicant exceed the current liabilities, (b) that the current and working assets are in cash, or in securities that are readily negotiable and have a full cash value, (c) that due allow-

ance has been made for the payment of dividends on bonds and stocks, also for bad credits, and that their own debts have been written off the books entirely, (d) that the face value of the statements have been properly discounted, and finally (e) that the intentions of the applicant are honest.

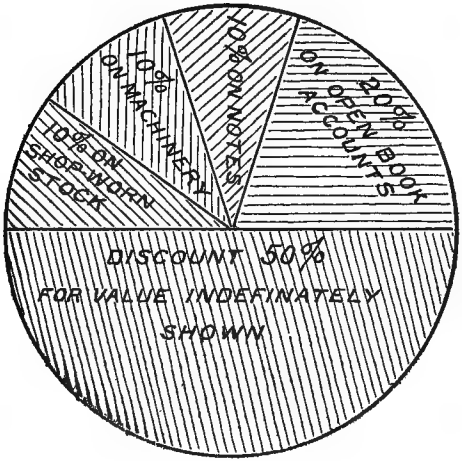

Fig. 29—Analysis of a Credit Statement

The example herewith will serve to show how the assets, liabilities, and capital affect the credit standing of a firm.

From this you will see that the capital in the three firms is the same in amount but that *A* is the best risk because he has no liabilities

and $10,000 in cash on hand; *B* is not so good a risk because his liabilities almost equal his

FIRMS

Assets	*A*	*B*	*C*
Machinery			$20,000
Stock	$20,000	$40,000	20,000
Accounts	10,000	30,000	20,000
Cash	10,000	2,000	20,000
Liabilities		32,000	40,000
Capital	40,000	40,000	40,000

capital and his cash is low, while with *C* his liabilities equal his capital and he is therefore practically insolvent and hence must not be granted credit at all.

CHAPTER III

CLOSING IN ON THE DEBTOR

Credit Extension and Credit Collection—System in the Collection Department—When to Call in Credit and Collect—Kinds of Delinquent Debtors—Methods of Credit Collection—The Credit Department—Outside Agencies—On Squeezing Payments out of Debtors—The Court of Last Resort—How Credit Adjustment Agencies Work.

You have seen from what has gone before how the credit department extends credit and how it works. The credit department includes still another department for the collection of the credits it has extended and this is known as the *collection department.*

Credit Extension and Credit Collection. Now credit extensions and credit collections are so closely related in the operation of any business where credit is granted that it is not practical to have the two departments making them under separate heads.

For this reason the credit manager must manage not only the credit department but also the collection department. While this

seems to be an overload of responsibility to pile onto the shoulders of any one man, still it is absolutely important for several reasons, chief among which is that the success of both of these departments depends almost entirely upon the ability with and extent to which they are able to coöperate.

This follows as a natural sequence for the data collected by the credit department and its decision in regard to the credit standing of its customers is of the greatest aid to the collection department in the prompt collection of debts. If these two departments were under separate heads there would be left open a loophole which evil or cross purposes could slip through and this would defeat the very ends for which the departments are organized as far as effectiveness is concerned.

The one absolute necessity of a successful business is perfect coördination and coöperation between the sales, credit, and collection departments of the selling branch of the machine. For what does it avail the sales department to make sales, or the credit department to extend credit, if the collection department can't collect, or *vice versa?*

The purpose of the sales department is, of course, to make as many sales as it possibly can, while that of the credit department is to allow it to make as many sales as it possibly can *safely*. This means that it must act as a check upon the activities of the selling department and naturally this tends to cause friction where there must be none.

From this it is clear that it is of the greatest importance that the members of a selling force are instructed as to the true purposes of the departments with which it must coöperate so that all of the departments will form a perfect working whole. That this condition may obtain, the credit and collection departments must first of all be welded together into a single unit, that is, the policy of both must be identical and they must work to the same end. It has been found that the best way to accomplish this is to have the management of both departments under one head.

It cannot be denied that where the responsibility of both of these departments rests on the shoulders of one man it is quite heavy. To ease up the burden a bit these departments must be as efficient as they can be made so

that the manager can spend his time in settling the big credit and collection questions, shown in Fig. 30, that come before him rather than thrashing out the little inconsequential details of everyday routine.

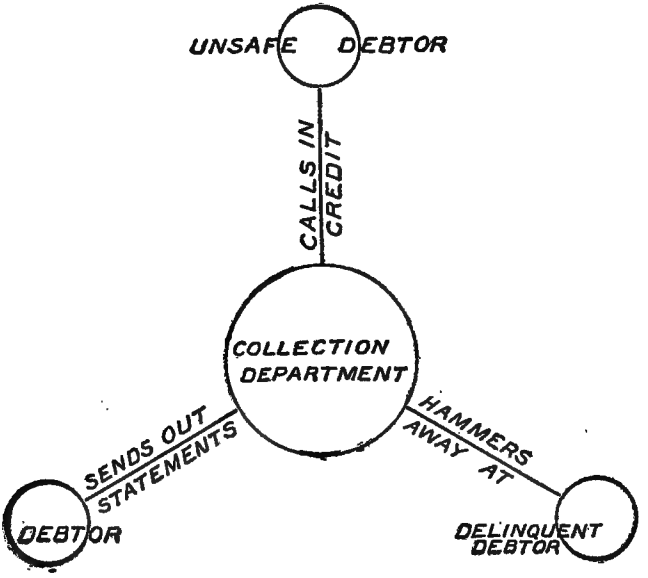

FIG. 30—THE THREE RING CIRCUS OF THE COLLECTION DEPARTMENT

To accomplish this the systems used in these departments must be simple, and at the same time accurate, so that the manager can immediately get hold of any piece of information

he wants and without the slightest trouble on his part.

System in the Collection Department. We have not got the space to go into all the details of a successful collection system but we will cover in a broad way the things that it embodies.

The following items are the important ones in the collection of credits that the manager must be able to find out with ease and dispatch, and these are (1) when the payment of bills falls due, (2) the credit standing of the debtor, and (3) the exact status of a collection at any given moment.

The collection manager must know when the payment of bills falls due in order to prepare for or be assured of their prompt collection. A knowledge of the credit standing of the debtor enables him to judge as to the promptness and certainty with which the debtor will pay and he lays his collection plans accordingly.

Not only must he know the rating of the debtor's business at all times so that he can tell whether the credit continues to be or not to be a safe proposition, but if he has reason to

believe that it is becoming doubtful he must be able to call in the credit and collect before it is too late.

And, finally, the system must provide a means to let the manager know the exact status of a collection at any moment so that he can determine the next prudent step to take to get the money. The use of the *tickler file* described in the preceding chapter will be found of the greatest service in this connection and in bringing the salient points of a collection before the manager when it needs his attention.

When to Call in Credit and Collect. We have already said that on certain occasions it becomes necessary. Now there are three specific cases when such drastic action will be necessary and these are (1) when the firm extending the credit runs short of funds, (2) when the firm extending the credit needs money to expand its business, and (3) when for some reason or other it is suspected that the debtor will fail to keep his obligations.

In the first two cases to call in credit must only be used as a last resort, that is to say, after all other means for raising money have failed. To call in credit on a good susbstantial account

means in the majority of cases that you will lose it in the future and, hence, it is clear that it would be poor policy to do so even though short of funds.

But when you find that an account is getting doubtful and there are good grounds for believing that the debt will not be paid, then there is only one thing left open for you to do and that is to withdraw the credit and do your best to collect. It is strictly up to the credit manager to decide initiative, and manipulation of the whole affair must rest entirely on his judgment of the situation.

One of the most common indications of a doubtful account is slow and reluctant payments which are as hard to get as pulling teeth. Of course the manager may scent danger long before this critical period arrives through some inside source of credit information.

Before closing out the account, however, a sure but often a quick investigation must be made. As we have pointed out before, for the credit man to close out a substantial account because of some groundless rumor or vague suspicion is for the firm to lose the account. Oppositely if he should fail to close

out when rumor or suspicion has a leg to stand on, the firm stands every chance of losing its money.

The first thing then that the credit man must do is to conduct a careful investigation, and this he can do in any one of several ways. Thus for accounts where only a small sum of money is involved it can be done through a *credit agency*, but for accounts where large sums of money are involved, the best procedure is for the credit man to conduct the investigations himself.

Sometimes he can do this through correspondence but often it is necessary for him to make a personal investigation and this is the way it is most commonly done. When on the actual ground where he can see the operations with his own eyes the credit man can find out many things which will either strengthen or weaken his *hunch* that the account is growing doubtful.

And he can do all of this without directly consulting the debtor and so causing harsh feelings if the account should prove after all to be strong. The advantages to be gained by this procedure are: (1) From a general survey

of merchandising in the town the credit man can feel the business pulse of the locality he is in; (2) from the debtor's local bank he can get a viewpoint as to how sound the debtor is; and (3) from the general news and talk about town he can get an insight into the debtor's character which has not been revealed previously.

The smaller the town the easier it will be for the credit man to get this information. But still he must realize that the last two kinds of information must be discounted and taken at their true values for frequently in a community folks are more than likely to grow a trifle short in their vision, and unable to read the signs that are as plain as the nose on his face to an outsider.

Kinds of Delinquent Debtors. This investigation will bring to light the fact that the debtor belongs to one of the following classes of delinquents, to wit, that (1) he is insolvent, (2) he is temporarily hard pressed, (3) he is careless, or (4) he is just naturally slow. Each of these classes requires a special mode of treatment in the collection of the debt.

With the first class there is only one logical course to pursue and that is to collect at once

by hook or crook and consider how you have done it afterward. Where the debtor is only temporarily hard-pressed and shows reasonable signs of rapid recovery the best policy is to let the credit run.

The debtor who is careless must be investigated thoroughly before taking any action; for if his payments are slow through carelessness the chances are his business is in the same fix even though he himself may not know or realize it. The fourth and last kind of a debtor is the kind whose inertia is so great that you've simply got to apply pressure to overcome it.

This class can usually be stirred into action by decisive correspondence and it is seldom advisable to call in the credit unless it is of course discovered that they are headed on a dead run toward insolvency, or unless it takes too great an effort to get paying action out of them.

Methods of Credit Collection. There are two methods in general use of credit collection and these are (1) through the credit department and (2) through outside agencies. When collections are made by the collection department they can be handled in two ways

(a) by correspondence and (b) by personal collection.

You have already seen the nature of good, strong selling correspondence in Part I, Chapter VII, *On Making Your Sales Through the Mails* and the collection letters sent out must be likewise strong, to the point, and give a heart to heart talk to the debtor, since they are to take the place of the absent credit man. Their aim should be to show the fairness with which you have dealt with the debtor and this being true you are entitled to fair play in turn.

It is a good plan never to let your debtor know that you are calling in credit because you have lost confidence in him, and don't let anyone else know it either. For instance if a couple of other credit men get to him first he will know that everybody is aware of his condition, and this is very apt to discourage him to such an extent that he will fail when otherwise he stands a chance of pulling his business out of the hole.

If you intimate your lack of confidence in his ability or intention to liquidate his debt, and should he then pull himself nobly out of the

hole and pay up, you will surely lose his future trade. The best policy is to indicate that your firm must have the money to carry on with.

The account though must never be allowed to drag along as this affords too great a chance to lose out entirely through the utter failure and final bankruptcy of the debtor. Your letters must be so logical and decisive that he can't get around, under, over, or through the arguments you offer.

Another phase of collection correspondence is the collection of debts at the time when payment falls due. Some collection departments send out semi-monthly statements on the 1st and 15th of each month. This is a poor plan for this reason: suppose a bill falls due on the 25th, then the mid-monthly statement brings it to the debtor's attention some ten days before the bill falls due, while the statement sent on the first of the following month does not bring it to his attention until payment is considerably overdue.

The only proper time to bring a bill to the attention of the debtor is the day the bill falls due so that when he receives the notice

he knows that it is time for him to pay immediately.

One of the surest means of getting prompt action from out-of-town debtors is to foot the bill with the statement that a "sight draft will be made on the debtor unless other form of payment is desired." If you do not include the alternative "unless other form of payment is desired" the statement would offend the customer and you might lose his trade.

As it stands, however, it gives your debtor the alternative, and if he does not reply to this notice within a reasonable time you can take it for granted that he prefers to pay through sight draft collection. If, however, the debtor fails to recognize the sight draft when sent to his local bank then more drastic means must be taken for the collection of the bill.

On Squeezing Payments out of Debtors. It is often possible to get a debtor to pay off his debt in small payments where it would be useless to try to get him to liquidate the debt all at once.

Where a credit man gets wind of a debtor's impending doom, and pursues this policy,

the debtor will usually pay because it keeps his credit good with other firms he is doing business with. When a debtor begins to go to pieces the credit man who is the first to scent the danger is the one who gets all of the money that is coming to him. To the slower credit men, however, is left only the pickings.

Still another means for getting money out of an obstinate debtor is to get him to give you a 30 or 60-day note, take it to his local bank and have it discounted and cashed. This scheme will work, as a rule, because the bank is right atop the debtor, so to speak, consequently it will have him focussed in the blind spot of its retina and hence will not sense his failure as has the wily credit man.

The Court of Last Resort. The last resort in the collection of a debt from a delinquent debtor is to try to recover the money by legal means. Now there are two classes of delinquent debtors (1) the honest failure, and (2) the fraudulent debtor.

With the first class of delinquents their intentions are good but their business ability was bad. Since the latter is not a crime, though admittedly inconvenient all round,

don't be too hard on them for they have done their best and no one can do more.

But the second class never intends to pay and are intent on beating you out of your money. Crooks of this caliber must be made to pay in full or be prosecuted to the fullest extent that the law affords, for in this lies the only protection of the creditor against fraud.

When it becomes apparent that a debtor won't pay up the only redress you have is to place the collection in the hands of an attorney. The latter can either be an outsider or he may be a part of the collection department's organization. As a rule the big firms employ a house attorney but where this is done it is the best policy not to let it be known that he is in any way connected with the firm.

Usually a letter from an attorney will suffice to bring forth a settlement or liquidation of the debt where half-a-dozen from a credit man will fail. Where the debtor is an honest failure and simply can't raise the full amount, it is better to accept a compromise or partial payment than to drag the matter into court as this is always a costly proceeding and not always a satisfactory performance. The fraud-

ulent debtor, however, should be forced to pay in full or else dragged through the courts on general principles.

How Credit Adjustment Agencies Work. Still another way to collect a debt is through a credit adjustment agency. These work their collections in much the same manner as a well-organized collection department of a firm.

These agencies give firms that are doing a small credit business, and which have no organized collection department of their own, the benefit of a trained force, and collections placed in their hands are made for a small percentage of the amount collected.

Moreover firms having collection departments can make use of them to advantage in (1) collecting debts so small that the collection department could not profitably take up its time with them, and (2) in collecting out-of-town debts that are hard to reach.

The credit adjustment agency tries to collect a debt by means of correspondence of the kind just described, and failing in this it will turn the collection over to a *bonded lawyer* who represents it in the town where the debtor has his business.

Credit adjustment agencies are much harsher in their treatment of a debtor than the collection department of a firm, for the former has as its sole object the collection of the debt and goes after the debtor rough-shod, whereas the collection department tries to get the money and at the same time to hold and build up future business.

Part IV

Business Wisdom

CHAPTER I

RAISING AND INVESTING MONEY

How to Raise Money—Forming a Partnership—Organizing a Company—How to Invest Your Money—Making Your Money Make Money—An Investor Versus a Speculator.

THE subject of finance covers so large a field it would take a book of this size to even scratch the surface of it. All that we can do here is to give you a few useful hints on (1) how to raise money to start a factory for turning out a patented product, as this is one of the most common beginnings of a business, and (2) how to invest money so that it makes more money for you.

How to Raise Money. We have written this chapter on the supposition that you have a patented article which you want to manufacture and market. About the first thing that a man runs up against in starting a manufacturing business is the proposition of raising sufficient capital to cover the cost of production and merchandising. This includes the cost of

machinery, raw materials, power, labor, selling, advertising, in fact everything until the product is finished and sold to the jobber, wholesaler, retailer, or consumer.

As an example we'll assume that you have a patented product which you want to make and market but that you haven't got the wherewithal to do these things on. This is a common everyday occurrence but fortunately, it is usually easy to solve and this is the basis on which many great industries and big fortunes have been built up.

Now there are several ways you can go about getting capital to start a business and among these are (1) to go into partnership with one or more men who will finance it, and (2) to form a company and float its stock.

Forming a Partnership. The best but usually the hardest way to get your proposition going is to interest a man or men who has or have enough capital and confidence in your proposition to back it up. To get in touch with men of means is nearly always a hard thing to do and to interest them is still harder though you can do it if you go about it in the proper way.

Just as a salesman must have a clever introduction and put up to his prospective customer a strong selling talk, so you must have an interesting and profitable argument to hand the capitalist, for what you are really doing is selling him your product—the product of your brain. But be careful you don't talk him to death for this is a failing that most inventors have.

One way to get an introduction to a capitalist is through your attorney, and if he is the one who has organized your company he will know all about the merits of the whole scheme. He will be able to put you in touch with the men in your town who have capital. With introductions from him you will stand a fair chance to get them to back you in your new enterprise.

Your attorney is by no means your only means of meeting moneyed men for you can often go to your banker, the merchants you deal with, and even the clergyman of your church, and get introductions through them to men who are likely to take up your ideas.

Finally advertising agencies will sometimes furnish you with introductions, especially if

they see that your scheme needs a big advertising campaign and that they stand a good chance of handling your account when you connect with capital.

A few advertising agencies which have large working capital promote schemes that they have confidence in themselves. Only in such a case they will tie you up with a long-time contract calling for the appropriation of a heavy percentage of your profits for advertising, which must go through their house.

Organizing a Company. Another way to raise money is to organize a stock company. To do this go to a corporation lawyer and have him organize and incorporate a company for you. Such a company will put your manufacturing and merchandising scheme on the map and from this time on you are eliminated as an impecunious factor, and your proposition begins to take on a businesslike air.

While the mere incorporation of a company will not bring any money into its coffers with which to begin operations it will enable you to raise the initial capital more easily and quickly than any other way. The actual money is obtained from the sale of the stock

of the company and the assets of the latter consist entirely at first of the patent you have turned over to it.

How to Invest your Money. The business man of to-day is not merely content to make money out of his business but he wants the money he acquires in this way to make more money for him—quite a natural and proper desire. But this is the place where many successful business men lose their money, that is to say, through their ill-advised efforts to make their surplus capital earn more money.

Making your Money Make Money. The only absolutely safe way to do this is to deposit your money in a savings bank where you will draw anywhere from 2% to 4½% interest. If, however, you are of an investigating turn of mind this seems like a beggarly low rate of interest when there are so many other kinds of investments which pay much higher rates.

And this is just where a lot of men fall down and lose out. They fail to realize that the higher the rate of interest paid on an investment the greater the chances they are taking with their money. While it is well to be conservative still it is not a good scheme to be so

conservative that you close your eyes to everything that comes along, but you must be discriminating.

An Investor versus a Speculator. Now let's see what the difference is between an *investor* and a *speculator*. An investor is a man who loans his money out on first mortgages, bonds, and listed stocks and to enterprises which have proved by past performances that they are thoroughly reliable. The investor is content with from 4% to 8% return on his money and usually he finds 6% quite satisfactory. The investor is a *sure-thing* man, or in the parlance of the sporting fraternity he is a *tin-horn*, that is, he never loses out.

A *speculator* invests his money too but differently from an investor; he is a gambler at heart and he is willing to take a gambler's chance. He disregards the laws of certainty and, hence, forfeits safety in his desire for higher rates of interest on his money. Unless he is a man of great financial genius or unless he is exceedingly lucky, it's a ten to one shot that he will lose his money.

So strong is this desire to obtain a high rate of interest that after the average man has

made a few sound investments he begins to speculate and this is usually the beginning of his finish. To play safe be an investor but never a speculator.

There are four kinds of investments which the inexperienced investor can safely make. The first is the savings bank and while this is the safest kind of an investment the disadvantage is that it very seldom yields more than 3½% to 4½%.

The second is buying bonds, but before you buy bonds you must have them investigated and this your bank will do for you. Just as thorough an analysis is necessary in buying bonds as in extending credit to the firm that sells them. The chapter on *Inside Credit Information* contains practically all of the points that you want to know about before buying bonds.

When you buy bonds get *short-term bonds*, that is, bonds that you can realize on in a short time. Bonds which run longer than ten years are not as a rule a good investment for an inexperienced investor to buy. The longer the time element the less the safety factor becomes. For this reason bond analysis of

future conditions is even more important than credit analysis of future conditions, for credit seldom extends over six months while bonds run for years.

As an investment *first mortgages* are quite like bonds, and, as a matter of fact this is what a good bond consists of. In buying first mortgages and bonds there is small chance for loss if you have made a thorough investigation first. The interest on all bonds, except *income bonds*, can't be stopped and consequently they are as safe as a bank.

Finally we come to stocks as an investment and right here let us say that of all the varied forms of investment that of buying stocks requires the most careful investigation and analysis. You will find on the market all kinds of stock from the *unlisted wild-cat* stock of an unknown oil-well company that sells at 10 cents a share to the A No. 1 *gilt-edged stock* of the big steel company that sells at away above *par*.

To purchase stock in a good, reliable concern that has stood the acid test of rigorous investigation is not speculation but sound investment. To buy stock in any other kind of a concern or

under any other conditions is speculation and you stand to lose, for the directors always have the privilege of stopping the payment of dividends. Moreover, if the concern you invest in is inherently unsound or is selling in an unsound market it may break at a critical moment and then of course you lose your whole investment.

To sum up, don't invest in anything that you have not investigated or analyzed, or had some one who is competent do so for you, as thoroughly as if you were extending credit to the concern, and you will safely be able to make your excess capital make money for you.

CHAPTER II

THE LOST ART OF MAKING A PROFIT FOUND

The Lost Art of Making a Profit—Why Merchants Fail—The Wrong and Right Ways to Figure Profits—What Overhead Charges Are—The Long Easy Credit Evil—The Open Book Account Evil—Weak Points in the Open Book Account System—What Trade Acceptance Is.

The Lost Art of Making a Profit. We have been through a good many manufacturing plants and retail stores where everything was hustle and bustle, where the highest priced experts that could be obtained were employed and where on the bright surface everything looked prosperous.

Yet on a close examination into the finances of the firms, we were surprised to discover that the valuable art of making a profit had been lost. Perhaps you in your business may have lost, if not the whole of this art, then perhaps a part of it.

It is our aim in this chapter, therefore, to cite a few points which often make the mer-

chant lose his legitimate profit, and which may make him operate at a loss for some time and end up with bankruptcy staring him in the face. This unfortunate state of affairs happens more often in the retail business than in any other, and it has been calculated that out of every one hundred retailers who start in business ninety-five fail because they never knew, or else had lost, the art of making a profit.

Now ninety out of every ninety-five retailers that fail do so because they have the wrong idea of the calculation of profits. In all other respects they are progressive and if it were not for this one great failing they would probably have kept afloat.

The misguided retailer makes his mistake in the calculation of profits in that he figures the *operating expense* and *net profit* on the *cost price* of an article as a basis, when as a matter of fact operating expense and net profit in the retail business can only be calculated rightly by using the *selling price* of the article as the basis of computation.

The Wrong and the Right Way to Figure Profits. To illustrate this point let's take the

following problem which is the one that the merchant has to solve every day. If you buy an article for $1.00 and want to make a net profit on it of 10% above your total operating expenses of 25%, what price must you sell the article for?

Give this problem to any retailer who has failed and he will instantly add the 25% and the 10% to the cost of the article and give you the answer as being $1.35. This is the reason he failed.

The successful merchant uses the following rule for the calculation of profits. From 100% deduct the sum of the operating expense and the net profit you want and *divide* the cost of the article by the difference obtained, when the quotient will be the price the article should be sold at.

Thus the successful merchant gets his selling price of an article by means of the above rule as follows:

From 100% he deducts 35% (that is 25% plus 10%) and this leaves 65%. Dividing 65% into 100% he has $1.54 as the selling price of the article. You can now readily see why the merchant who calculates the selling

price of the article in this problem as $1.35 soon makes a total and complete failure of his business.

After a few months of such costly selling he wakes up some morning to find that his capital has dwindled and shrunk until he has to close up shop, or his creditors do it for him.

Now let's go a little deeper into the problem of which we have shown you the incorrect and correct solutions. There are three chief things that the profit on any article must cover if the merchant is to be protected against loss. These are: (1) overhead expense; (2) interest on the capital invested; and (3) contingencies.

The expenses of the first two of the above items can be accurately ascertained. The last item, however, is the one that causes the merchant the most trouble, for it depends on several extremely variable and unforeseen conditions, hence its accurate calculation is practically impossible.

What Overhead Charges Are. Overhead charges comprise the following expenses, all of which can be accurately determined beforehand; named, these are: (1) rent; (2)

insurance; (3) wages; (4) advertising; (5) light and heat; and (6) freight. The interest on the capital invested can also be accurately calculated.

The contingencies, which comprise the following expenses, are, however, impossible to calculate with any degree of accuracy, and these are: (1) natural depreciation of stock; (2) losses through bad debts; (3) dishonest employees; (4) inefficient overbuying and poor buying; and (5) backward seasons.

The three big points enumerated above, that is, overhead charges, interest on capital, and contingencies, are known as the *total operating expenses*, and the first solution of the problem, *i.e.*, $1.35, will enable the merchant to cover them and make a profit provided his contingency expenses are not more than 10%. Should his contingencies exceed 10% they will eat into his profits and should they exceed 20% he will be operating at a loss and on the rocky road to bankruptcy. A selling price of $1.54 however amply provides for contingencies.

The Long, Easy Credit Evil. We now come to the long, easy credit evil, which next to improper calculation of profits is the most

prevalent cause of the failure of the retail merchant.

In the early days of business, when banks were few and currency was scarce, long time credit was often a necessity, but now in these days when the banking system has been developed to a point approaching perfection and when the coin of the realm is plentiful, it is an evil of the retail business rather than an aid to it.

To the end that you can see just how long, easy terms of credit help to ruin the unsophisticated merchant let us follow the chain of circumstances that naturally accompany the extension of such credit. J. C. Martin is a retail grocer in a Massachusetts town and he buys his stock from the *Bay State Wholesale Grocery Company.*

Since this wholesale company has unlimited capital it grants to J. C. Martin long, easy terms of credit, which pleases the retailer but it makes him do two things which he shouldn't do, namely: (1) he overstocks, and (2) he in turn grants long, easy credit to his customers.

He soon reaches the point where at the end of the month he is carrying 200% and upwards

of his month's business on his books. Then comes a local financial stringency and his customers either move away or can't pay him, with the final result that J. C. Martin is a total bankrupt.

Of course the blame for J. C. Martin's failure rests mostly on his own shoulders. He should have insisted right from the start with his customers on short credit, and he should have made his customers pay their bills when they fell due. Again he never should have carried more than 80% of his business on his books at the end of the month.

But the *Bay State Wholesale Grocery Company* is really as much to blame for J. C. Martin's failure as he is, and perhaps more so, for since he is a small merchant with no former merchandising experience he looked to the wholesaler, who has unlimited capital, to set the example in the matter of credit. The example the firm set, which was long, easy credit, ruined him for he failed to realize the advantage that a large working capital gives.

We have told you this all-too-true story of the small retailer so that you will not make the

same mistake that J. C. Martin did. Buy your goods on discount terms, sell on short credit, and collect your bills promptly. You will find that this policy will not make you lose but will gain customers for you, and the few that do drop out because your methods are too businesslike to suit them will be supplanted by others who see the merit in doing business in a businesslike way.

Further the few customers you will lose through this policy are always the unreliable ones, who would drag you to your ultimate ruination anyway. We repeat—cut out the long time, easy credit business that has a strangle hold on you and be a success.

The Open Book Account Evil. And finally we come to the last great evil that the retailer has to contend with and this is the *open book account system.* This system of granting credit has been in common use for years and, unfortunately, it has been permitted to exist without molestation.

It was only five years ago when the war started that any serious thought was given toward checking it. Certainly of the many

beneficial results of the war the solution of the open book account problem is not the least. This solution which we strongly advocate was made possible by the Federal Reserve System and it has changed our inadequate and unorganized financial system into a smoothly running piece of financial machinery.

Weak Points in the Open Book Account System. Before we go on and tell you how the problem of the open book account was solved, and the solution of which is the last word in financial and credit progress, we'll point out a few of the abominably weak spots in the old book account system which have been the indirect cause of ruining merchants ever since the system originated. These are: (1) the open book account has no definite date of payment; (2) the open book account ties up your capital for a length of time that is determined not by you but by your customer; (3) the open book account is often hard and expensive to collect because of the abuse of sales terms, extensions in time, and collection correspondence; (4) the open book account is not easily negotiable, hence it cannot be turned

quickly into available cash; (5) the open book account is discounted 50% of its face value because it only shows the approximate liquidated value of the assets; (6) the open book account fosters the deferment of credit liquidation; (7) the open book account permits the goods to be returned; and (8) the open book account provides you with no adequate evidence of sales and it is legally lax.

The above are only a few of the many bad features of the open book account system and upon any one of these points can hinge your failure.

What Trade Acceptance is. The modern credit vehicle which was introduced under the Federal Reserve System is known as trade acceptance and it not only does away with the evils of the open book account system but it helps you in many other ways in the conduct of your business and assures you of success.

A trade acceptance is shown in Fig. 31 and you will observe that it is entirely unlike either a sight draft or a promissory note. It has the following distinctions from a note,

viz.: (1) a note is always drawn by a person, while a trade acceptance is drawn by the buyer, and (2) a note is used to indicate the borrowing of money, whereas a trade acceptance is the direct evidence of the *sale* of goods and of prompt payment.

You will see that the trade acceptance shows on its face that it is drawn on the debtor for the buying price of the goods sold and signed by the merchant when the debtor signs his name to it, it shows that it has been accepted and it then becomes legal tender for the payment of the debt.

Now let's see just how you use trade acceptances in your business. On selling a bill of goods to a customer you ask him to sign a trade acceptance for the purchase price of the goods. If the goods are for ordinary purposes the acceptance will run from thirty to ninety days but if for agricultural purposes it may run for six months.

After signing the acceptance yourself you will then take it to the bank and get it *cashed*, the rate of discount for this service being ½ of 1% lower than such service is on a promissory note. This is because the bank can dis-

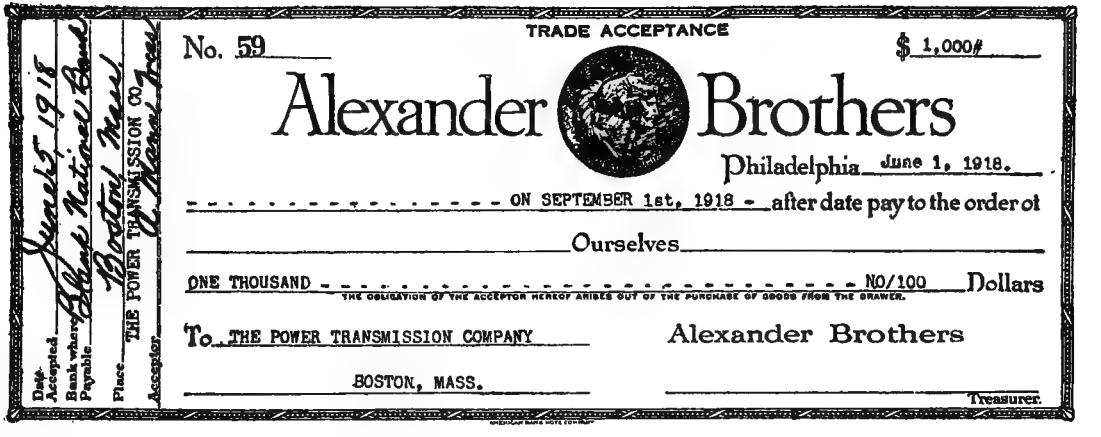

FIG. 31—A TRADE ACCEPTANCE

count the trade acceptance at a *Federal Reserve Bank* at a lower rate of interest than it can a promissory note. In this way you make your sale and get your money immediately; your sale does not drag along on your book accounts for it is the banker who makes the collection. See Fig. 32.

Now let's see some of the advantages of the trade acceptance system, viz.: (1) the customer will pay trade acceptance promptly in order to keep his credit good at the bank; (2) the trade acceptance converts your accounts into immediate cash and releases your capital, thus building a firmer foundation for your business; (3) the trade acceptance takes the banking business out of your hands and puts it in the hands of the banker where it belongs; (4) the trade acceptance makes it unnecessary for you to borrow money; (5) trade acceptances are *two-name* papers and hence better legal tender than single-name papers, consequently they can be discounted cheaper at banks; and, finally, (6) trade acceptances minimize your collection costs.

Put this system into use with your customers and it will start you roaring along the

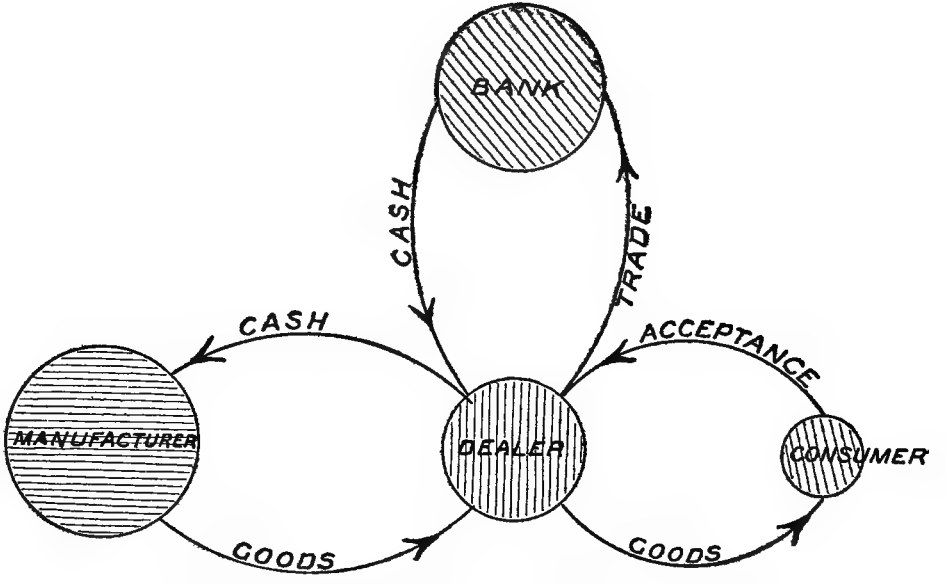

FIG. 32—HOW THE TRADE ACCEPTANCE SCHEME WORKS OUT

road to prosperity. It is now being used throughout the length and the breadth of the country by the largest and most successful merchants and by following their example you can be one of them.

A WORD AT THE START

THE art, or science, or practice of salesmanship cannot be taught academically or automatically, or by book, lesson, or teacher. The concrete vocations, — bookkeeping, stenography, typewriting, and the clerical or mechanical side of business, — may be wholly or partially imparted by book or lesson; but the practice of a vocational art, which does not depend upon definite rules, cannot be driven into anybody by rote or regulation.

While salesmanship is not independent of basic principles, and while it is dependent upon unwritten, if not written, law, its action is so closely allied to personality that it cannot be presented either by chart or table of rules.

Therefore, the author attempts to present the great principles and ethics of salesmanship, a study and analysis of them, in a way which he hopes will be helpful, practical, and profitable; and all that he says is interwoven and supplemented with the experience of active authorities, who have given the larger part of their lives to selling, on the road, or behind the counter, or to the management of salesmen and saleswomen.

Every word in the book represents composite experience, and not the mere opinions or training of the author himself. From out of a mass of experience, his own and others', he has attempted to present word pictures of business fact.

TO WOMEN READERS OF THIS BOOK

For convenience, and only for convenience, the masculine noun and pronoun have been used in this book; but every word in it is intended for women as well as for men.

Custom, as well as convenience, suggests this form.

The constant mention of both sexes would be confusing and require unnecessary repetition.

CONTENTS

WHAT IS SALESMANSHIP?

Page

Its position in the economy, progress, and profit of business as an indispensable wheel in the great engine of activity. — Salesmanship was born at the birth of trade, and without it modern business-doing would be impossible 1

THE PSYCHOLOGY OF SELLING

Some of the principles of salesmanship. — A semi-scientific analysis of the component parts of the art of selling goods. — The elements of salesmanship. — The strength of the whole is in the harmony of the parts 10

WHAT SALESMANSHIP OFFERS

What salesmanship offers at the start and all along the line. — What it may lead to. — The important and indispensable position occupied by the salesman in the world of business. — Perhaps no other vocation gives one a better business opportunity 21

KNOWING YOUR GOODS

The absolute necessity of being fully acquainted with what you sell from the ground up, even to the growing of the raw material. — How to find out all you need to know about what you sell. — The importance of knowing your goods cannot be over-estimated 25

KNOWING SOMETHING BESIDES YOUR GOODS

Page

The value of general knowledge and information, that the salesman may be able to meet his customers socially when occasion requires and converse with them upon current events, even during the "heats" of business 33

DIAGNOSING THE CUSTOMER

The art of "sizing-up" the customer, of discovering in advance his characteristics, his desires, and his needs. — A matter of great selling consequence 38

THE INSIDE SALESMAN

The inside, store, counter, or retail salesman. — How he differs from his brother on the road. — His opportunities, and how he may improve them 44

THE TRAVELING SALESMAN

What he is. — What he does. — How he does it. — His chances of getting ahead, of becoming a manager, or partner, or officer in the business. — The hardships of being constantly on the move 56

SATISFYING THE CUSTOMER

The customer's side of the sale. — His pre-eminent rights and those he will assume anyway. — The selling necessity of catering to him, if you would do business 70

APPROACHING THE CUSTOMER

The great commercial and selling value of creating a good first impression. — Salesmen are often judged by the way they appear at the initial meeting . . . 77

FORCING A SALE

Page

The danger of using force and coercion. — When they may be used and how to use them. — The difference between force and suggestion 82

EMPLOYER AND EMPLOYEE

Their relation to each other. — Success is dependent upon a getting together. — They should be friends and co-workers 85

WORKING FOR YOURSELF

No matter how menial your position may be, you are primarily working for yourself; and the more you work for yourself, the more you work for your employer 92

ANTAGONIZING THE CUSTOMER

Something always to be carefully and persistently avoided. — The antagonistical salesman cannot possibly succeed. — Keep on good terms with your customer at any reasonable cost 97

GETTING ACQUAINTED WITH THE CUSTOMER

Business acquaintanceship and friendship. — Learn about your customer, that you may handle him to better mutual advantage, and be able to hold him permanently 103

PERSONAL APPEARANCE

The public-seeing side of the salesman. — His dress and the care of his person. — Hints and suggestions of selling value 108

GOOD NATURE IN SELLING

Page

A most essential requisite. — The place it occupies on the stage of successful business. — Good nature stands for good sales 113

CONSERVATISM AND TAKING CHANCES

There is safety in the middle of the road. — Conservatism compared with liberalism, progressiveness, and taking chances. — The right and profitable mixture of both 117

RESPECT YOUR EMPLOYER

The place occupied by the man you work for. — His importance and necessity. — The salesman's relation to his employer, the one under command, the other in command. — The respect rightly due to the man at the business head 121

DOING WHAT YOU DO NOT HAVE TO DO

The one thing that puts you above the men of ordinary attainment. — Almost anybody can do what he is told to do. — The commanders of business spring from those who are not satisfied with being simply faithful to demanded duty-doing 124

THE KNOCKER

The knocker and the fault-finder never succeed. — The knocking salesman cannot sell goods to advantage. — He is out of tune with business principles. — The difference between knocking and proper dissatisfaction 127

TELLING THE TRUTH

Page

Truth and honesty are profitable commercial and selling commodities. — The danger of misrepresentation. — Honesty is the best selling policy 131

MODESTY IN SELLING

Genuine and false modesty, reticence, and fear. — Their effect in selling goods. — Modesty as compared with self-respect. — The proper estimate of oneself 137

COURTESY AND POLITENESS

Their vital importance in the consummation of trade. — Without them the selling of goods is impossible. — Two great selling assets 140

STICK-TO-IT-IVENESS

The necessity of keeping everlastingly at it. — The essentiality of persistency. — The value of continuity. — Nothing sticks to the man who does not stick 147

ORIGINALITY IN SELLING

The good and the bad of it. — How to use it to selling advantage. — The dangers attending its indiscriminating use 153

ADVISING THE CUSTOMER

The selling value of acceptable advice and suggestion. — How to profitably advise the customer. — The kind of advice he will gladly accept. — How to help him to mutual advantage 157

BEING AFRAID OF YOURSELF

Page

A chapter directed to the salesman who does not possess sufficient self-reliance, who seems to be under the whip of fear, and who does not present himself and his goods with confidence in either 162

YOUR COMPETITORS

Speak well of your competitors. — To do otherwise is to advertise them, to give the customer the suspicion that you are afraid of them, that they have better goods than those you carry. — There is room for all of you. — Help one another 165

IRRITABILITY IN SELLING

It is sure to work injury, especially to the seller of the goods. — Probably you can get rid of most of it if you make up your mind to do so 167

PERSONAL HABITS

The private life of the salesman. — The dangers of dissipation in business and out of it. — The selling advantage of living a clean and normal life 172

TAKING AN INTEREST IN YOUR WORK

It is absolutely essential that you take and keep an active interest in your work, no matter how menial it may be. — There is no other way to succeed in selling goods 175

TREATING THE CUSTOMER

Page

The common, and somewhat over-done, custom of treating the customer. — When to do it and when not to do it 179

INDEPENDENCE IN SELLING

Real independence and its money-making value. — The kind of independence which antagonizes and prevents the sale. — The profitable mixture of independence and dependence 182

SELF-CONFIDENCE IN SELLING

The quality of being reasonably sure of yourself and of the goods you sell. — If you are wholly without it, you have no right to remain in the selling line . . 187

STUDYING OTHERS' METHODS

Do not depend wholly upon yourself. — Study the methods successfully used by others. — Learn to learn from others. — Become familiar with what others are doing 191

INDIVIDUALITY IN SELLING

The selling value of individuality and personality. — The salesman of individuality has an advantage over the man of too much conventionality 197

PUNCTUALITY IN BUSINESS

The selling necessity of always being on time. — The on-time man may waste a minute. — The behind-time man may lose a day. — Promptness is a leading business asset 201

THE VOICE IN SELLING

Page

Little selling is possible without the constant use of the voice. — Its tone and quality are of great importance. — The training of the voice 204

WHAT TO DO OUTSIDE OF BUSINESS

Some of the things that one should do outside of working hours for his own sake and for the sake of business. — Doing nothing save business-doing is conducive to business failure 206

WHAT TO READ

What one may read to advantage to his business and to his own personal improvement. — The book and the periodical, including the daily newspaper, are business as well as social necessities 212

WIT AND HUMOR IN SELLING

Genuine wit and clean-cut humor. — The dangerous imitation. — How to use them to advantage in selling goods, and how to avoid their over-use and the places where they are not conducive to good selling policy 217

RECREATION AND EXERCISE

Rest, recreation, diversion, and exercise as parts of right living and good business-doing. — When and how to play for the benefit of yourself and your business 220

CANVASSERS AND BOOK AGENTS

Page

House-to-house sellers. — The opportunities offered them. — The trials and tribulations attending this class of sales-people 226

THE ACADEMIC EDUCATION OF THE SALESMAN

The pre-education of the seller of goods. — His necessary schooling. — The high school, the technical institution, the college, and others. — What he should know academically or technically before entering the selling side of business 231

THE VOICE OF SELLING EXPERIENCE

Specially written articles by twenty-nine leading salesmen, sales-managers, and prominent commercial men commanding large business outputs. — Each article presents the long and personal experience of the writer, and altogether they give a composite picture of selling fact and opinion. — A list of these collaborators is given on the following page 240

L. E. WATERMAN Co., NEW YORK CITY. By F. P. Seymour, Sales-Manager 313

PRACTICAL SALESMANSHIP

WHAT IS SALESMANSHIP?

THE salesman was born at the birth of trade. Business-doing of every kind appears to be impossible without the intervention of salesmen or of some personal action which stands for salesmanship.

The customer, whether he be the jobber, the distributer, the retailer, the peddler, or the consumer, may know what he wants, and he may be aware also that he cannot live or do business without buying something of somebody. But for some reason, or, rather, from what would ethically and scientifically appear to be lack of reason, he may not order the goods or supplies, or he may buy less of them, unless somebody solicits his trade and tells him what to do, or forces him to do, what necessity and common sense make necessary for living or for doing business.

Theoretically it would appear to be an unnatural condition of business, which makes it necessary for the buyer to be told what he should buy, rather than to do it of his own volition. But whether this be so or not, this condition has always existed, still maintains, and will continue to be, until civilization passes further up the road to perfection, when selling will be done by

waiters and not by coaxers of trade. When this time arrives, a large part of the machinery of business will be unnecessary, and the strain of trade reduced to the minimum.

But to-day, with or without reason, the selling of practically everything, from goods on the counter to steamships and locomotives, is a direct or indirect result of solicitation, either by personal application or by the silent salesman known as advertising, and generally by the use of both.

For the present, the solicitor, drummer, or salesman is one of the foundation stones of commercialism, without which it appears impossible to build and maintain the business structure.

There are many definitions of salesmanship. Here is one:

Salesmanship is a personal face-to-face action or effort on the part of an individual which is intended to bring about the sale of the goods for sale.

And here is another:

More broadly speaking, salesmanship is the art of selling something to somebody, and everything which contributes to the consummation of this exchange is necessarily a part of salesmanship.

Salesmanship differs from demonstration in that the latter may not include the former, and it is like demonstration because good salesmanship usually includes some form of demonstration.

Considered wholly from a commercial point of view,

salesmanship consists of personal solicitation, the salesman and the customer meeting face to face. In this book I am so considering it, and am not attempting to bring into the argument any kind of selling action beyond face-to-face solicitation and those things directly pertaining to it.

Salesmanship is not unlike the plea of the lawyer before the court or the jury. Both contain arguments; and, in both cases, the presentator, either of arguments or of goods or of both, is attempting to make the party addressed do what he asks him to do.

On the one hand there is something for sale, whether it be a life insurance policy, an automobile, a suit of clothes, or a barrel of potatoes. The owner of what is for sale, or his representative, desires to get rid of what he has, to transfer it or sell it to somebody who wants it or can be made to want it.

To do this, he employs every method which will in any way influence the buyer, including printed matter, advertising, well-arranged warerooms, handsome office fittings, and, most important of all, a proper presentation of the thing for sale by an individual commercially known as a salesman, who adds personality and voice to the selling argument.

The salesman exists for two reasons: first, custom; secondly, because it is obvious that even the best informed buyer cannot know everything, and the well-posted salesman is in a position to give him information about the article for sale.

There is opportunity for a discussion man-to-man, and for the presentation of argument; and this information and these arguments cannot be given with any degree of fullness by the printed page or advertisement. Or, if they could be, they would not even then take the place of personal information-giving and custom-made argument.

Salesmanship cannot be analyzed with chemical or other exactness. To define it, to separate it into its component parts, would be as difficult as it would be to analyze ability and to tell what it consists of.

Yet we all know what salesmanship is, and we are able to measure the results of its qualities and quantities.

The art of salesmanship includes several fundamental elements, phases, or parts, which, consolidated, make a salesman. These I have considered in chapters by themselves. I will, however, briefly and collectively discuss them here.

The first-class salesman, whether he is behind the counter, on the floor, or on the road, whether he peddles books or sells furniture, is proficient along the following lines:

First, he knows his goods. No seller of goods, who is unfamiliar with them, can sell them to full advantage. I know of a few expert salesmen who have closed large deals without an intimate knowledge of the goods they sell, and I know of two or three men, in particular, drawing or earning large salaries as salesmen, who are woefully, and almost criminally, ignorant of their

wares, yet are able to consummate larger sales than ninety per cent of thoroughly posted salesmen. These men are natural geniuses, pre-eminent traders, who seem to be able to sell anything at any time to anybody.

Secondly, the ability to describe or talk the goods. Many a man with an intimate knowledge in the premises, one both technical and broad, fails because he does not know how to talk. It is obvious that all the knowledge in the world is worthless unless it is distributed. The man of knowledge, and not of tongue or of pen, is about as badly off in business as would be the man of voice only, with nothing back of it. The commercial value of what we know is dependent upon our distribution or use of it. If we do not know how to talk our wares, we cannot readily sell, and we have no right to be members of the selling craft.

Thirdly, a general knowledge of business principles. There are salesmen who can only sell goods, possessing no real business ability beyond that of selling. Some of them succeed moderately, but few of them become great salesmen. I am convinced that a general knowledge of business, or some ability to manipulate business, is essential to good salesmanship or to best salesmanship.

Fourthly, a working familiarity with the business methods and action of one's competitors. To successfully and continuously consummate trade, and to be able to overcome expected and unexpected obstacles, one must not be unfamiliar with the methods used by those in the same line of business.

Fifthly, the ability to talk something besides "shop." To do this requires a knowledge of things in general. Practically all successful salesmen are reservoirs of general information about business and of matters outside of business; and this information, always ready for immediate delivery, permits them to be both agreeable and profitable to their customers. It materially assists in making a good impression.

Sixthly, the ability to diagnose the customer, or, in the language of the street, "to size-up the other fellow." Unless one is able to do this, to some degree, at least, he cannot hope to be more than a mediocre success, on the road or behind the counter; and he stands as little chance of winning the battle of trade as does the commanding officer of an army who meets his enemy without a knowledge of its strength or proportions.

While the ability to judge men and customers, to diagnose and to size-up, is the one thing which stands between the great salesman and one of ordinary capacity, I am not willing to say that diagnosing is the most important element of all. It is a necessary one, and no one can succeed without some of it. Those who possess it to a marked degree belong to the upper grade of the upper class, and those who have little of it are pretty close to the bottom.

Seventhly, good-nature. Comparatively few morose, over-dignified, cold, and chilly salesmen have amounted to anything. It is possible for them to sell goods when the buyer is as anxious to buy as the seller is to sell,

but they are practically worthless at the initiative, and are seldom able to obtain or to hold any trade worth having. Some managers look upon good-nature as the most important requirement of all. Whether it is or not, it is a fact that without it great success is impossible.

Eighthly, that ability to play a double part, to interest and benefit the customer while being thoroughly faithful and profitable to the house one represents. Salesmen holding permanent trade never forget the customer's interest, and yet they always work for the benefit of their own house.

Unless a salesman is both pleasing and profitable to the customer, he will not continue to do business, nor will he be permitted to hold his position if his sales are not profitable to the house he represents.

Of course, there are many other elements which contribute mightily to salesmanship, such as persistency, faithfulness, promptness, and the like, without which one may not hope to succeed at anything. These I have attempted to cover in other chapters.

Which is the most important of the eight points of selling? The answer is of little moment. The proficient salesman possesses them all, not in their fullness or perfection, because that is impossible. Most salesmen are strong in one direction and weak in others. They have not selling balance. All of these attainments play leading parts on the stage of salesmanship, and their relative positions are of little consequence. They do not compete with one another.

The successful salesman is a natural trader. He is fond of selling. He likes to meet competition, and loves to overcome obstacles. He is a fighter, a strategist.

Without this natural ability, more than ordinary success is impossible. Nobody can make of himself what he is not. The power of self-creation does not exist. If one possesses no trading capacity, he can never sell many goods to anybody anywhere. But even a little ability may be developed into what amounts to about the same as much ability. On the other hand, great natural capacity is worth little unless trained by experience and persistency, that everlasting stick-to-it-iveness which turns failure into success.

Ordinary selling ability can undoubtedly be developed and trained sufficiently to make its possessor reasonably successful upon the road or behind the counter.

Goods seldom sell themselves. They have to be personally and satisfactorily presented. Nearly all of them are in duplicate. The purchaser can usually obtain the same thing at the same price somewhere else. Competition is confined partly to the reputation of the house and to the ability of the salesman, and not altogether to the quality of the goods offered for sale.

The individuality and personality of the salesman, who for the time being is the firm itself, — his ability and perseverance, — are really the principal factors in the consummation of trade, assuming, of course, that

the reputation of the firm is high and the goods of acceptable quality.

Would I advise one to become a salesman who could not meet all of these requirements? Yes, if he was not altogether inefficient, and had confidence and a willingness to put his shoulder to the business wheel and to PUSH. Few of us may hope to reach the flush of success. It then becomes our duty to take up the thing we can do the best, however poorly that may be.

One may succeed in a moderate way at selling goods, or in any other line, without being properly balanced. If he be deficient to a marked degree in many of the things which go to make good salesmanship, there is probably some other field of endeavor which better suits his capacity.

The top of salesmanship has never been fully occupied, and there will always be room at the top. Comparatively few ever reach it. There are many grades below the top, and all of them, except the lowest, offer a living, and often a good living.

If you like to sell goods, and you possess some ability in that direction, there is no reason why you should not become a salesman, unless there is something which you like as well or better and can do as well or better.

THE PSYCHOLOGY OF SELLING

THERE is a psychological or an inner scientific reason for every action, for everything which contributes to every movement of every kind, even to thought itself. Nothing exists without a source, a creative beginning; and everything is subject to some law, known, partly known, unknown, or mysterious.

I do not propose to enter the depths of psychology, because this science, — which, by many, is looked upon as the coming scientific basis of all science, — is yet an only slightly solved riddle; and much of what is known of it should not be presented, unless clothed in the garb of purely scientific term and analysis.

We know that it exists and has definite and immutable laws; yet we have not been able to deeply analyze it or to separate it into all of its component parts.

The time will come, however, when this fundamental science will be universally studied, and the good of its secrets will be known and usable by the people at large.

To-day, psychology is a growing science. It is still in its cradle, and has not learned to walk save with faltering steps. We are still in the psychological foothills, but sufficiently advanced to at least attempt to analyze it with hope of being able to apply it somewhat to the important movements of life, including business-doing.

Opposed to psychology, to the theoretical, and to scientific reason, is what is known as "common practice," which, for the time being, may occupy a more important place, or, rather, seem to do so, in active life.

Until we become civilized, and have our minds under accurate command, we shall be unable to fully apply the inner virtues of any science or art, and will, to an extent, depend upon results or what seem to be results; and, if they are satisfactory or appear to be, we shall be likely to work backwards instead of forwards, allowing results to steer us, if they are apparently satisfactory.

Let me give a concrete, and yet humble, example of practice out-generaling science, of result pre-empting scientific reason.

Some years ago, an inventive genius constructed what is known as a double-runner. This contrivance consisted of two sleds, fastened to a board, the forward one being on a pivot and capable of being steered by a wheel, ropes, or by out-riggers, held by the man in front.

This inventor applied science to the making of an almost perfect coasting machine. The runners were double-shod and absolutely true. Between the forward end of the board and the steering sled were roller-bearings, and the whole was steered with a wheel. There were no ball-bearings in those days. Everything was balanced to the equipoise of successful nicety. A better and more scientifically constructed coaster had never been produced.

The inventor, proud of his creation, offered to race any double-runner of any size or kind. A hill was selected. Thousands watched the contest, which resulted in the defeat of this marvelously constructed racing machine.

A man weighing two hundred pounds, who did not know anything about science, fastened two big sleds to a long and heavy plank, without making any effort towards trueness or accuracy. The whole affair was crude and out of adjustment, but it weighed twice as much as the scientifically-made double-runner; the owner weighed fifty pounds more than the inventor, and he put twenty fat men on board.

Weight won the victory over science. The clumsy machine greatly out-distanced the one built upon scientific lines.

Had this contest occurred in a vacuum, or had both the double-runners been of equal weight, including the passengers, science would have been in the van. Instead of this, the "weight of practice," opposed to theory and science, came in ahead.

This condition, for the present, somewhat applies to our imperfect way of doing things, and true science and high art do not always occupy the front row; but, sooner or later, real science and art, including an understanding of psychology, will enable truth to win in every contest, and brute-force will play no part on the stage of life.

This present condition, however, gives no excuse for

not attempting to understand the science of every-day things and of business, although we cannot fully comprehend them; nor should we object to digging deep into science and to applying it up to the reach of our intelligence.

The selling proposition, briefly, is as follows: The salesman has something to sell, and it is his duty to get somebody to buy it. It is a battle of quality of goods and quality of salesmen with the buyer who is the opposing or objecting force.

These two conditions, or men, meet face to face, the salesman finding it necessary to take the initiative, to fire the first shot, so to speak; the other side, the buyer, having the pre-eminent right to remain passive, or to act on the defensive, or to allow the selling-shot to take effect.

Pure civilization, and the higher ethics of life, would probably refuse to recognize the art of salesmanship, and would not consider it a part of life's economics or necessity. It would require that the salesman, instead of expending ninety per cent of his energy, that he might consummate trade by the use of every kind of pressure, should become a demonstrator, an expert, a talking lexicon, a source of information, that the buyer may use him for what he knows, not for what he can do. The buyer, then, would come to the goods, and the salesman would deliver a lecture upon them and answer questions. Beyond this salesmanship would not go.

Against this is present fact or conditions. Notwithstanding that every buyer knows that he must purchase, knows that he wants the goods that he buys, or should know it, he may not purchase anything, except necessities, unless under pressure.

Every salesman will tell you that from fifty to eighty-five per cent of his sales would not have occurred if it were not for the selling efforts he made. This statement must not be construed to mean that business would be reduced from fifty to eighty-five per cent, but the specific business coming to any one firm would be cut as stated if salesmen were not employed.

It is also a fact that, although the buyer would do a certain amount of purchasing anyway, the output of all goods, taking them as they run, would be very much less, — nobody knows how much less, — if salesmen were not generally employed.

There is something wrong and unnatural about this, but so long as it exists, it must be met.

The necessities of life are few. Custom, rather than necessity or refinement, is responsible for about seventy-five per cent of everything sold, except eatables. People buy partly because they want to excel somebody else or to have what others have.

For years simplicity has appeared to be almost a lost art. To-day we are doing double the business which any civilized nation would think of doing; and not only are we foolish in the purchase of useless luxuries, but we are making necessities of things which

can play no part in either economy or refinement and which have nothing to do with real progress.

But we must take things as they are, not as we would have them.

There are few goods which are not duplicated in quality and quantity. Few salesmen have anything which is exclusively their own. The sinking of any one house, or the annihilation of any one salesman, would hardly make a ripple on the sea of trade.

Why is it that one salesman succeeds where another fails, with identical goods, identical prices, and identical demand? Simply because one salesman has a certain faculty of presenting his wares and of subjecting the buyer to his personal influence.

If the purchaser were perfectly sane, and knew his business, the salesman would be unnecessary, and personality would not count for much in selling, for most of it could be done by mail or through demonstrators. But the present buyer is very human and does not see straight, any more than other people do. He is in a condition to be directed, and the salesman who succeeds understands how to direct others and how to make them do what, perhaps, they would not do if they were let alone.

I do not mean to say that the salesman absolutely controls the buyer, that he exercises what is falsely called a hypnotic influence over him, that in his hands the buyer is powerless and must do what the salesman tells him to do. Except in a few instances, no

salesman possesses this power in any degree of fullness; yet the good salesman has some of it, and is able by personality and argument to bring the buyer into a purchasing mood, to make him buy, then and there, when, perhaps, he would postpone the purchase or give the order to some other house.

There is another element which plays a mighty part in selling: the average buyer does not usually want to buy, or says he does not, or thinks he does not, — and usually he says he does not want to buy whatever his intention may be. The salesman, then, has before him a wall of opposition, even when the buyer has made up his mind to purchase. Not only must he present the right goods and the right prices, but he must possess that unanalyzable ability to make the buyer do what he may not voluntarily do or what he would postpone doing. This ability may be considered the fundamental bottom of good salesmanship under present conditions.

Even the woman in front of the counter, with her mind fully made up to purchase, may go to another store, or may decide to wait a day or two, if she and the salesman antagonize each other, or if she is not pleased with the salesman's manner or methods. And, further, a large proportion of retail purchasers may be made to buy more if the salesman understands how to sell. It is a fight, a battle of wits, the buyer starting in ahead of the game, the salesman to win in the end if he can. However much the buyer may

want to purchase, the salesman should want to sell him more than he wants to buy; and unless the salesman keeps this fact in mind, and realizes that it is more difficult to sell the customer than it is for the customer to buy of him, he will make only mediocre sales.

It is true that no one salesman can handle all customers with equal success. The customer has his preferences, and no one possesses all of the necessary qualifications.

The buyer may refuse to adapt himself to the seller. The seller must adapt himself to the buyer. The buyer will not take the initiative, as a rule. The salesman must always take it. The buyer will not advise the salesman or attempt to help him. The salesman must both advise and help the buyer. The buyer is always, or almost always, an opposing factor. He has a right to occupy this position, because he is paying out his money, while the salesman is taking it in.

It is a duel, the buyer occupying the preferred position and permitted to fire first.

The salesman, if he would be successful, must meet this opposition, bind up his wounds if he is hit, and proceed with his business.

It is believed by many that the fundamental basis or bottom of ability comes prenatally, and that success in any line is impossible unless one is born, so to speak, into the work.

I do not propose to minimize the value of inherited tendencies, or to claim that prenatal influences do not play a part in life; but I wish to state with all the earnestness in my power that inheritance is worth mighty little in any market unless the possessor of it does something to develop it and to adapt it to himself and to his conditions.

No man ever succeeded in anything, whether he had natural ability or not, who did not make an affort to use what Nature had given him.

Take the voice, for instance. It is probable that the great vocalist had nothing to do with the natural quality of his vocal organs, yet his success is due as much to the training of his voice as to the original quality of the voice itself.

There are natural salesmen, those who seem to be able to sell under all conditions; but these men did not reach superlative success without study, experiment, and experience.

There are those who have not any natural selling capacity. They can never become great on the road or behind the counter; but, if they try hard, and let no opportunity for improvement slip by them, it is quite likely that they can do fairly well in the selling side of business.

I cannot say, however, that I would advise one without much selling ability to attempt to become a salesman, unless he has reason to believe that he will do as well in that, however poorly he may do, as he

would be likely to do in something else. But the man who does not know how to sell, and really cannot learn after the most strenuous effort, who finds selling obnoxious, had better go into something else.

If your goods and prices are right and you do not succeed, there is something the matter with your natural ability or you have not properly developed or trained it. If you find the most careful training and the most earnest efforts do not avail, then you may properly decide that you do not possess that something necessary for successful salesmanship.

Remember that you cannot reconstruct the buyer, that he will continue to do as he pleases. If necessary, you must reconstruct yourself to meet him, or else fail. It is useless to find fault with the customer. You cannot reform him or make him over, but you may to some extent make yourself over, or, at any rate, so train your ability that it will be able to accomplish something and give you all the success your capacity entitles you to have. But, before you decide that salesmanship is objectionable, test yourself most carefully, because what you call inability may be sheer laziness.

Most people can sell goods if they make up their minds to do so, and many of them, even poor salesmen, can do better at selling than at anything else.

Fundamentally your success as a salesman does not wholly depend upon the house you work for, nor altogether upon the grade of the goods you sell, nor

entirely upon the demand for them; but in your ability to make people buy things, and to do it without apparently forcing them to do so.

While in the heat of selling, if you would be successful, you must be stronger than the buyer in front of you. Otherwise you will not consummate more than a few sales.

If you have this ability, you can train it into a great business asset. If you have not much of it, you can do something, provided you make up your mind to do it, and provided your common sense and judgment tell you that selling is the best thing for you to do.

WHAT SALESMANSHIP OFFERS

SALESMANSHIP is by many considered the most important part of business-doing. Whether it is or not, it appears to be absolutely indispensable. No business is done without the intervention of some sort of salesmanship, whether it consists of the soliciting letter or of the human solicitor.

There are four great divisions of business, subdivided as many times as you please: the man who makes something or superintends the making of it; the man who manages the business, finances it, creates and maintains its policy, but does no actual handwork; the man who attends to the purely clerical part of it; and the man who carries the goods to the customer and is present at the consummation of sales.

The maker of the goods, unless he be the proprietor, is not always adequately recognized, because he has little to do with the direct disposition of the output. Theoretically he is the most important of all, because he creates, but he can do his work without an initiative display of enterprise and without using strenuous methods.

The clerical worker or bookkeeper should be respected far more than he is, for without him business would be impossible. But as he does not directly

bring in the profits and is not on the firing line, he is not always able to present tangible evidence of his worth to the business. He is, to an extent, like the cook in the camp. He is responsible for good health, digestion, and even life, but the world seems to think more of the forager who goes out into the open and brings something back with him. The bookkeeper plants and does not harvest.

The salesman is directly concerned with the profit-getting of the concern. He is the profit-maker. He is in the limelight all of the time. What he does can be seen and measured. If he sells a certain bill of goods at a certain price he can place that transaction on the firm's blackboard, there to be seen and appreciated. He has brought in just so much measurable profit. Perhaps this business would have come anyway, but it is a fact, nevertheless, that it came through him. For this reason he is in a position to expect and to command promotion.

Every day he may have an opportunity to make a record for himself which can be written out in cold figures. Others may be doing more work, and really contributing more to the up-building of the business, but none of them can show daily records of success or failure. What they do, while it may be appreciated, cannot always be measured as can the product of salesmanship.

The salesman is the only one who continuously meets the great outside, whether he be behind the

counter or on the road. He, above all others, comes in contact with living and active conditions. He sees the world. He has constant opportunity to learn about men and things. He is forced to meet competition and opposition, not theoretically, but to come face to face with it.

His fighting qualities are marshaled into line. He stands and walks while he works, while others remain seated. He is in the active side of trade, the side which moves and does the things most seen. He is in the midst of experience, and cannot help absorbing it, unless he is a fool. He has a better opportunity, as business runs, than have the members of any other department of trade.

The fact that the majority of our merchant princes, and other men of business mark, have been salesmen, and rose from salesmanship to the command of business, indicates that the salesman has the best opportunity to reach the top round of the ladder.

It is true that great captains of industry have sprung from other than salesmen, but the vast majority of them sold goods. Many a bookkeeper has risen to the head of the firm, and the foreman of the repair shop may go to any height; but the majority of business men of success sold goods and earned their reputations by the quality of their salesmanship.

I am not depreciating the clerical or the manufacturing sides of business, because able men will succeed anyway, if given half an opportunity, but

there is probably more chance of success in the selling department than there is in any other for the man of activity, for the man who is willing to work, and for the man who is able to meet competition and opposition.

If one cares only for a quiet life, if he is not ambitious, if he is satisfied to let well enough alone, if he would rather float with the stream instead of struggling against it, he has no right to enter the selling side of business.

But if one is willing to both give and take, to both float and swim, and is strong enough not to be overcome with present disaster and with constant opposition, and if he enjoys the storms of life, winning or losing as may be his turn, but winning more often than losing, then salesmanship offers him more than he is likely to receive from any other department of trade, and will give him better opportunity to round himself out into the successful man of business.

KNOWING YOUR GOODS

ONE of the best salesmen in America, if one may reckon selling ability by the aggregate of profitable sales, knew next to nothing about the goods he sold, and yet he seemed to be able to handle any kind of a selling proposition, and he earned or received a salary of $10,000 a year. His ignorance was not concealed. In fact, he made no effort to cover it up; and, what is more remarkable, he sold goods of a technical character where more than ordinary knowledge would appear to be necessary.

His employers were men of national reputation as technical experts, and ninety per cent of his customers were intimately familiar with details; and yet this man, with hardly a superficial knowledge of his goods save price, was able to close deals which seemed impossible to other salesmen thoroughly familiar with every part of the business.

This man was a selling genius, a wonder, a remarkable exception. What he did not know about his goods, he knew about something else. He could diagnose his customer and play him like a chessman on the chessboard. He knew men and things. He was well-read and posted upon about everything except the goods he sold.

Why did he allow himself to be ignorant of the goods he handled, when a little effort on his part would have been sufficient to have made him familiar with all that pertained to them? There can be no acceptable answer. His ignorance was self-inflicted and without excuse or reason. Perhaps he never tried to reason it out.

Notwithstanding that he earned or received $10,000 a year, he was a monumental failure, one of the greatest that I ever met. He did not do his best, because he was too lazy to fully equip himself for the battle of trade. He simply used what Nature had given him, did as he pleased, and succeeded marvelously well if you compare his results with those of ordinary others, but not half so well as his natural ability permitted. Had he learned his business, he would not have been a salesman on $10,000 a year; he would have owned the business.

I know of other men who handle enormous sales, and yet they know little about their goods. But all of these men, like the first, are failures, because every one is a failure, no matter what his salary or income may be, if he does not do his best.

The clerk in the grocery store, who learns all he can, who tries all the time, who is ever on the lookout for opportunity, is a much greater success, and deserves more credit, than does the man who draws $10,000 a year and yet is capable of earning $20,000.

Success is the product of one's best. Anything

below that is failure. Some men succeed in spite of ignorance, of laziness, and of indifference; that is to say, they appear to succeed, yet every one of them is a failure.

No man is a success who runs amuck with principles, who refuses to accept axiomatic rules and regulations, who is under the domination of his own arrogance.

One of the great fundamental principles of selling is the essentiality of knowing the goods you sell, and there can be no real or good salesmanship without it, and there are no exceptions, although occasionally we see what appears to be an exception.

If you have decided to become a salesman, and have reason to believe that you can sell goods, the first thing for you to do is to learn about your goods, to know them from the ground up, and, further, you should be familiar with similar goods whether carried by your house or by other houses.

This knowledge of your goods, even to the lower technical side of them, is necessary whether you be behind the counter, or on the road, or travel from house to house.

All the magnetism in the world, the supreme power of diagnosis and superlative selling ability, will not enable you to do your best without a knowledge of the goods you sell.

But let it be understood that knowledge of the goods without anything else is worth about as little

as would be a barrel of oxygen to the chemist who wanted to make air and found it impossible to obtain nitrogen.

There are men, dismal failures at selling, who have the most intimate knowledge of their goods. This knowledge, with something else, rounds out the perfect salesman. By itself, like any other one thing, it is worth practically nothing.

How far should this knowledge go? To the bottom, I should say, even to the very creation of things which go to make the goods you sell.

If you are selling cotton goods, for instance, it would be well for you to know how cotton is planted and how it grows, its condition when it leaves the field and how it is turned into cloth.

Perhaps this knowledge may not seem to appear to be valuable, and it is quite probable that you may never directly use it; but this intimate familiarity with every part of the goods, beginning with Nature's work, like all fundamental matter, will enable you to better present your wares to your customer.

Buyers are naturally question-askers. Salesmen are logically answerers of questions. You never know when a question will be asked, and nothing pleases the customer better than to feel that the salesman before him is thoroughly posted, not only in selling, but in the making of the goods from the raw material.

So much do I believe in this that I honestly feel that a saleswoman selling hosiery can make more and

better sales if she can trace a pair of stockings to the very ground which produced the raw material, although she may never impart that knowledge to anybody.

Your knowledge should extend into the use of the goods. What is any particular thing good for? What will it do? What will it not do? How long will it last? Why is it better for the customer to purchase it than anything similar?

You should learn to appraise values, to know qualities, to be able to explain why a certain brand is better than another, to make profitable comparisons.

It is not only necessary to know about the goods you sell, but you should be familiar with all similar goods sold by your house or by other houses, all substitutes and things which may be substituted for them. You should be a storehouse of technical information for the customer to draw upon as he may elect.

I would not advise you to throw this information at your customer, to force it into him, to talk scientifically and technically on every occasion; but you should have it on tap, ready for immediate delivery, and you should carry it even though you may never directly use it in your selling.

Educators and others differ materially, but all of them consider that certain academic fundamentals are essential to the building up of general education, even though some of the so-called fundamentals may not be used directly; but they are considered necessary for the foundation of the education to come, and

without them the education that we are using from day to day would totter and fall.

These same principles apply to an intimate technical knowledge of the goods you sell, even though you may seldom impart the information. But if you have this knowledge, you are better able to distribute the other information which is generally wanted and which could not exist without the inner knowledge upon which it rests.

Upon general principles, the more you know about your goods, the more you know about how they are made and sold, even to climatic conditions, the more and better sales you can make.

But there is such a thing as over-doing it, of keeping too close to the bottom, of spending too much time upon the techniques, and becoming too letter-perfect. It is not necessary for you to know as much about the manufacture of the goods as does the superintendent of the factory, and you need not be as skilled in details as are the workmen at the bench or before the loom. A close familiarity with them, covering all generalities and a general knowledge of the details, is likely to be sufficient. It should be considered a necessary part of salesmanship, and you should not feel yourself fully equipped without it.

How can you obtain this knowledge? In many ways.

Practically every industry has its literature. Your employer has, or should have, a business library. If he has not, buy the books or get them from some library.

The trade-paper gives much information. Read it regularly. And if there is more than one trade-paper devoted to your line, read them all, the poor ones and the good ones, for the poorest paper may contain valuable clippings.

Interview your fellow-salesmen. Play a regular game of profitable conversation. Go to the heads of your department and of other similar departments. Become friendly with the superintendent or foreman of the factory. All of these men are glad to impart information. Nothing pleases a well-posted man better than to tell what he knows to the fellow who wants to know it.

Visit every part of the factory, if your concern maintains one. See everything made, and begin with the raw material. If you are working for a jobber or retail house, get a letter of introduction to the superintendent of a factory. He will gladly accommodate you, and think all the more of you for asking the privilege. Probably you will learn more at the factory than at any other place, so far as the quality of the goods is concerned, but do not stop with the factory.

Although things are very much alike, and there are few exclusive articles, everything has some specific character; and it is necessary for you to be able to locate this advantage or peculiarity and to talk understandingly about it.

Your business reading should not be confined to

the goods you sell, but should cover all similar products and business in general.

Next to the factory, the best information is likely to come from contact with other salesmen. Here you may learn by observation and questioning the methods of handling goods, not only those used by your firm, but those of others, and you should analyze the difference. Each salesman will have a new-to-you message of information.

A familiarity with transportation facilities will not come amiss.

A thorough knowledge of what you sell is a fundamental part of salesmanship, an asset which continuously comes into play and without which the fullness of result is impossible.

KNOWING SOMETHING BESIDES YOUR GOODS

THERE are recorded cases of men of marked and extraordinary achievement, who have succeeded in making money and in successfully managing vast enterprises, without being familiar with much of anything except with the goods which directly pertained to their specific business.

I have one man in mind, who was almost completely ignorant of everything outside the place of his work, and who could hardly read and write; yet he accumulated millions of dollars and obtained an international reputation as a money-getter.

I have met, and am more or less acquainted with, quite a number of men, all of them money-makers, all of them business successes, and yet they know little of the world at large, practically all of their knowledge being limited to the things which are directly a part of their business. Their houses are places to sleep in, and their magnificent dining-rooms to them are no better than quick-lunch counters. They do not even know how to sleep or eat properly. They care for neither literature nor art, nor even for pleasure. Dissipation does not attract them, not because of their moral character, but because they have not the time to spare for it.

These men are exceptions, and they have succeeded in spite of their ignorance. But none of them would think of attributing any of their achievements to their ignorance and lack of interest in things outside of their business.

On the other hand, many men give too much time to outside or general matters, to the sacrifice of business.

We cannot serve two masters, either in business or out of it. We cannot do two things equally well. We must have a principal interest, and to that we must devote the major part of our working time.

It is obvious that the astronomer would never have discovered a star if he had not given the bulk of his time to star-gazing; and it is as true that the salesman must devote more hours to his business than to things outside of it if he would succeed in selling goods.

This is an age of specialties and of specialists. Unless we know one thing better than all else, we shall never make more than mediocre success. Yet the value of our specific knowledge is dependent upon a reasonable amount of general information, which allows us to better accumulate and distribute specific knowledge.

A knowledge of things in general, a familiarity with affairs outside of one's specific work, not only enables its possessor to do better work and accomplish more in a business way, but it makes him a better man and a better citizen. Without a knowledge of some-

thing besides what pertains to his business, he would be a mere automatic worker and a social dummy.

The salesman, particularly, should be a storehouse of general information, that he may impart it to the customer who wants it or asks for it. Unless he be posted upon things in general, has a reasonable knowledge of the rudiments of the arts and sciences, of politics and of literature, and particularly of men and things, he will betray his ignorance to his own detriment, and will not be able to meet his customer except upon a merely trading basis.

I do not mean to say that the salesman should be a connoisseur of art, or of science, or of literature, — a walking cyclopedia of one thing or an encyclopedia of everything. He has not the time, and, if he had it, it would not be necessary for him to be a conversational expert and a general distributer of learning. But unless he can talk understandingly upon general subjects, and especially upon those which bear some relation to his business, he is at a great disadvantage.

The traveling salesmen meets active men of money, who have automobiles and motor-boats, horses and other hobbies. If he knows about the things his customers are interested in, he will be a hail-fellow well met, and can get much closer to them than would be possible if he were familiar only with his business.

The retail salesman meets people of every class, and, although he does not have the same opportunity for conversation and discussion as that presented to

his brother on the road, a general knowledge of general things is likely to come into play every day and several times a day.

One should certainly know something about the weather and how to intelligently prognosticate to-morrow's conditions. If the customer in front of the counter says: "I hope it will not rain to-morrow," and she probably has good reasons for her preference, she will think more of the salesman who gives her a reason why he thinks it will or will not rain, than of the one who says he does not know or says nothing. Even this little thing, the weather, is worth studying, and so is every other thing which becomes a part of the daily life of the customer, that the salesman may be able to reply intelligently, at least, and to answer any reasonable question with some degree of accuracy.

How can you find out about things outside of your business? Read all you can get hold of, and have the time for, about things of general interest. Enter into conversation with intelligent people of experience. Make it a point, when you talk with anybody, to introduce a subject which he is more familiar with than you are. Every one likes to talk about his hobby or to show his knowledge. Encourage him. It will do him good and do you good. It is a mutual exchange of satisfaction.

Become a persistent and consistent reader of books and periodicals containing general information, and, especially, those carrying matter which constantly

comes into your sphere of business and life. A little reading, even thirty minutes a day of it, if well selected, will cover a vast amount of ground. But above all play the game of intelligent conversation, always bringing up some subject of general interest, and make special effort to converse with well-posted and up-to-date men and women.

Attend lectures and talks. Join some organization outside of the business club. Information is in the air, and all you have to do is to collect it. It is free for the asking.

The reader is referred especially to the chapters, "What to Read" and "What to Do Outside of Business."

DIAGNOSING THE CUSTOMER

SALESMANSHIP is a battle on the field of business strife, the seller on the one side and the buyer on the other. Yet it may be a friendly fight, and there need be no bitterness in it; for, in the consummation of a good sale, both parties win. But it is a contest, nevertheless.

The proficient general never enters a battle, or orders his troops upon the field, without attempting to size-up the strength and character of the opposer. It is almost as necessary that he should know the power and character of the other side as it is to be familiar with his own forces and conditions.

The difference between an ordinary practicing physician and the specialist is largely in the power of diagnosis possessed by the latter. Every regular practitioner, the graduate of a medical school, is familiar with the science and practice of medicine; and almost any educated doctor, whether he be an expert or not, can effect a cure of a curable disease, if he knows what the matter is with the patient. But many a physician does not know when and where to use the treatments and medicines with which he is familiar. What would cure one may make another worse.

The so-called specialist or expert may not know any more about medicine than does the experienced family doctor, and may not, perhaps, be as familiar with general medicine as is the ordinary family physician, but he possesses the power of diagnosis. In most cases he can determine what the ailment or trouble is. Unprofessionally speaking, he sizes-up the patient, finds out what the matter is with him, and when he has reached this point, he is reasonably sure of curing him, if the disease be curable.

The successful salesman, like any other specialist, owes his more than ordinary success, not altogether to his knowledge of the goods and his ability to describe and present them, but, to a very considerable extent, to his ability to diagnose the buyer, to know the buyer, — his desires, his necessities, and his characteristics, including his hobbies, if he has any.

I think it is nearly as essential to know how to know the buyer as it is to know and describe the goods. At any rate, no one has succeeded in climbing beyond the second round of the ladder of salesmanship who has not possessed the ability to size-up and to diagnose the customer with some degree of accuracy.

Unless the salesman understands the buyer he is at a great disadvantage. Of course, he can obtain in many cases advance information about the man he expects to meet, and be prepared, therefore, to see him; but this advance information, coming from others, does not and cannot take the place of the

ability to personally size-up the customer and the situation, and to do it instantaneously if necessary.

Every one, buyers not excepted, has a personality, more or less hobbies and eccentricities. The ability to obtain a knowledge of them, either by inquiry or by intuition, gives the salesman an immense advantage.

Some sales-managers consider the power of diagnosis to be more poignant than any other factor in salesmanship, but I will not discuss its relative importance. So long as it is necessary to good salesmanship, and expert salesmanship is impossible without it, it may be considered at the head or at the foot, as you choose to place it.

Understanding or diagnosing the customer is that ability to feel as the customer feels, to get inside of the customer, so to speak, to see both sides at the same time, your side and his side. This cannot very well be taught, but a few suggestions may be of assistance.

Become a student of human nature. If this art does not come naturally to you, cultivate it to the best of your ability. Cultivation will make even barren soil somewhat fertile. Study every one who approaches you, whether he be a customer or not. Attempt to see every side of life and to be in sympathy with those you come in contact with, especially with those who are different from you. Discuss likes and dislikes with others, and human nature in general.

Consider every one you see as a type, and attempt to understand his characteristics. You will soon learn

that different people require different treatments, different methods of approach, different forms of arguments, that some will take kindly to strenuous methods, that others require positiveness or like hammer-blow arguments, while others have to be handled carefully and with the exercise of the greatest discretion.

Become acquainted with people, — the more the better. Experiment with them. Approach them in different ways. Talk to them along different lines. Do not have one form of argument, or one method of selling goods, at a sacrifice of all others. Do not be stagy. Be elastic and pliable. Of course, you should not outrage the general principles of salesmanship, but the same principles may be applied in different ways.

Especially associate with salesmen, traveling salesmen, and counter-men. Get hold of their ideas and study their methods, and consider every one you come in contact with as a customer, adapting yourself and your conversation to him. See what pleases him and what does not. Learn by experience what is acceptable to him and what is antagonistical. This you can do whether you are behind the counter or on the road, for in both places you meet representatives of every class.

Especially study faces. Learn to recognize at first sight, if you can, the nervous customer from the passive. Some folks enjoy a lot of talk and pleasantries, while others are matter-of-fact and will not tolerate other than straight talk.

You will not always strike it right, any more than

other specialists do, but a careful study of conditions should enable you to be more often right than wrong. You will discover that there are certain methods which are acceptable to practically every customer, and that there are others which must be used less frequently.

Avoid all unusual methods, or any display of the erratic or over-original, unless you are absolutely sure that they will appeal to your customer. Do not break over conventional forms unless you are reasonably certain that the customer will appreciate your originality and display of brilliancy. Keep in the beaten track until you are able to spread out. There is safety and some success in the middle of the road, although more than ordinary achievement is dependent upon being able to travel all over the road without losing your way.

In every town there are good salesmen, far more successful than the average. They possess something which contributes to their success and which the rank and file do not have. Get in contact with them and study them closely. Ask their advice, and remember that some people can do a thing which you cannot do, because they have greater personality, more force, and more ability. Therefore, it is not always safe to copy another's method unless you have his ability and resemble him generally.

Of course, you will be always under the risk of chance, for there is no sure method or any form or rule that is sure to win. But the more you study business and the conditions which surround it, the more you get into

close relations with them, the easier it will be for you to know men and things, and there will be a greater likelihood of meeting with success.

If you have any ability at all and are persistent, you will sooner or later learn how to somewhat diagnose the customer, particularly if you allow your failures to lead you to success. If you size-up a customer wrong and fail to make a sale, you have learned a valuable lesson, perhaps of more importance to you than if you had succeeded.

Remember that you must cater to the customer as you cannot compel him to bend to you. This being the case, there has been established a great law of salesmanship, which compels you, as the salesman, to learn to understand the customer, to anticipate his wants, that he may always welcome you, be glad to see you and to talk with you, whether or not he buys of you.

THE INSIDE SALESMAN

EXACT figures are impossible, but I think I may venture the statement that there are six times more men and women selling goods from behind the counter or inside the store than there are of those who travel on the road.

The inside salesman works exclusively indoors, and waits upon the customers who call at the store or place of business, and he does not go outside for trade. He takes what comes to him for the most part, although he can solicit on the outside by inviting people to come to him.

The fact that a proportion of inside sellers act as though they were waiters and not sellers of goods, and are, or appear to be, indifferent to building up a clientele of their own, and seem to be uninterested in their goods or their business, must not be taken as a reflection exclusively directed to inside sales-people, for this condition exists among salesmen on the road, although the traveling man, as he runs, is usually more aggressive and shows greater enterprise.

We are all children of circumstances and influenced by environment. Only a part of us do what we do not have to do, and the majority of sellers of goods, as of all other people, possess ordinary ability, and their

movements are often confined within the circle of conventionality.

Because the traveling man — the outside salesman — meets obstacles at every turn, and is obliged to take the initiative for the most part, he is, from force of circumstances, more aggressive, as a rule. If he were otherwise, he could not sell goods to any advantage. Environment and persistent conditions force him to exert himself. If he does not, he fails.

While, on the other hand, the inside man, whether or not he possesses a higher or a lower grade of ability, finds that he may make his living by waiting on people and by not always taking the initiative. Because he may do this, he is not forced, as the outside man is, to exert himself at all times.

Then, the inside man is directly under the discipline and orders of his superiors, and is quite apt to follow directions more or less blindly; while his outside brother, usually away from headquarters, must do a lot of self-thinking, and order and control himself to an extent which is not so necessary for the man directly in contact with his employer. This condition, much more than the individual ability or inability of the salesman, is largely responsible for the indifference shown by many inside sellers of goods.

I do not propose to compare the innate ability or the real character and ambition of either with the other. There are bright men and nonentities on both sides, men both of enterprise and of progressiveness and rep-

resentatives of the "don't-care" and "won't-work" classes. If there is less activity on the one side than on the other, it is because of conditions, largely imaginary ones.

Some inside sellers think that they do not have the same incentive or opportunity as that given to their outside colleagues. Assuming, for the sake of argument, that this be so, in some cases it does not furnish any good reason why the inside man should refuse to practice the initiative.

There is opportunity behind the counter and outside of the store. Opportunity is in the very air we breathe. It is everywhere, even in the poorest and most miserably conducted place of business where the employee may seem to be but a part of an automatically run business-getting machine.

But remember that opportunity never carries a torch. It travels by by-ways and along the side streets. It does not parade in the middle of the road. It makes no noise. No herald sounds its approach. It passes along in the quiet of the starless night. It makes little effort to meet anybody. It seldom extends its hand. It minds its own business. But it is ever ready to grasp the hand held out to it and to be a permanent guest in the house of progress.

I have heard of opportunity-less stores, where the sun of chance never shines. But I have never seen one, and I have never found any one who was willing to make affidavit that he had seen one. Even the store

of perpetual grind cannot help grinding out some opportunity.

Let the inside man particularly bear in mind that no work counts to anybody's credit, if it is done wholly because it has to be done. The work of success-making is that which is done voluntarily and not spurred to activity under the whip of business or necessity.

Men of more than ordinary success take the initiative, do their level best, because they want to, not because they have to. They do their duty, never shrink, and, what is more, they do more than their plain duty. Doing what we are told to do, and only that, accomplishes the minimum of result.

The inside salesman has one advantage over the traveling man in that he has less competition, and, further, because his customers come to him for the most part, and some of them will approach him if he makes no effort to attract their attention. This condition, unfortunately for the lazy and the indifferent, tends to breed inactivity, but it gives the progressive salesman a splendid opportunity to shine in decided contrast.

Because it is possible to make a living inside the store without being progressive, the man of action has all the more chance to show and to use what is in him. As a matter of fact, it takes a higher grade of character to be successful inside the store than it does to succeed on the road, because work done which does not have to be done always springs from the highest motives.

Because trade comes to the store, does not furnish any good reason why the inside man cannot use the progressiveness and tactics of the road. He has a fine opportunity to learn business, because he is close to the heart of it. He may become the head of a department, or even reach the position of superintendent, or gain an interest or a partnership.

If he would exert himself, as does the man on the road, the chances are that he would not remain behind the counter indefinitely, but would eventually become a manager of a part of the business.

He has his choice of sleeping or of working, of doing his best or of merely making a living.

He has another advantage, and that is that he can retain his position if he does fairly good work and attends to business. The store, by its advertising and enterprise, has furnished him with material to work upon. With half of the selling ability and effort made by the man on the road he can earn his living. And this, instead of keeping him back, should spur him on to greater effort.

Every salesman is watched. If he lags or loafs, no one takes any interest in him. He will simply be tolerated. If he shows enterprise, he is encouraged and recognized, perhaps not every time, but his proficiency is sure to pay in the end.

The dead-centers behind the counter exist because of lack of energy and of an unwillingness to do more than ordinary duty.

The inside man should learn his business, know all about the goods he sells, how they are made and where they come from, and he should be somewhat familiar with the goods outside of his department.

Further, he should learn business, — its principles, its ethics, and its actions. He should not be unfamiliar with the methods of other stores and with similar goods carried by them.

It would pay him to learn his goods from the ground up, to know how the material is grown or obtained, how it is manufactured, and what it is good for and is not good for.

He should read about his goods in books and in trade papers, that he may be known as the best-posted man in his department. This information will help him in many ways, not only with his employer, but with the customer, for the customer is looking for advice and takes kindly to expert suggestion.

He has an unusual opportunity to study human nature, for he meets all kinds of people. He sees them when they are happy and when they are sad. He can help them or hinder them.

One reason why many inside salesmen do not succeed is because they are perpetual fault-finders, kickers, and knockers. They look upon the dark, not the bright, side of their positions. They seem to think that they have no opportunity and that the man over them has no interest in them. They forget that the business man is in business for profit, that the salesman is a

part of his business army, that without him he cannot do business, and that, if he be a man of any business capacity, he cannot help recognizing faithful and progressive service.

It is idle to talk about favoritism and about being kept down, although this condition may occasionally exist. Business is business, and business plays no favorites, except with men who are deficient in business acumen.

The salesman may be an automatic seller, a sort of human slot-machine, if he will; or he can be a thinking, acting, doing man, if he prefers. If he thinks, studies, and throws the best of himself into his work, even the meanest employer is likely to promote him from selfish motives.

It is pretty difficult to keep a good man down, as good men run, although promotion does not seem to be always equitably distributed. While many of us do not get what we deserve, we are pretty sure not to receive what we do not deserve; and few so-called favorites stay there, if they get there, unless they are worthy of getting there.

The average inside salesman does not respect himself as he should. He does not realize that he is a working part of the great business machine, and not an insignificant cog in a brainless wheel.

Activity counts behind the counter and everywhere else.

If you are inside the store, help to make your depart-

ment the most attractive one there. If you do not have the goods, you have yourself. Do not be a mere seller, but a demonstrator and an exhibiter.

If you are not a fluent talker, learn to talk. You can improve in this direction, if you will. You can learn about your goods, and when you do, you will find that it is pretty easy to talk about things you know about.

If you are always on the alert, are well-posted, and interest fairly radiates from your face, some of your customers will speak well of you, and the superintendent is sure to notice you.

You cannot always satisfy the customer with the goods you sell, but you can, if you will, usually satisfy him with yourself. You are not responsible if the goods do not suit, but you are usually responsible if you do not suit. There may be something the matter with the goods, but do not let there be anything the matter with you.

Remember that you are between two factors or extremes, your employer who is anxious to have you sell goods, and your customer who usually can get along without him, you, or the goods, for he can buy elsewhere. To succeed you must stand between the two for the benefit of both.

Politeness behind the counter is indispensable. The more of it the better, and there is very little danger of your over-doing it. Treat your customer as you would a guest in your house. Radiate good-will and cordiality.

Be known as the customer's friend, the man it pays to trade with.

Do not look for promotion all the time or worry too much about recognition. If you do not get it, perhaps a part of the fault is yours; but you are pretty sure to get there if you deserve to, sooner or later.

There are a few concerns who do not give opportunity to their employees, who buy them on the market and treat them like cattle; but these concerns are few and far between, because it does not pay to be brutal or unfair. If you happen to be connected with one of these, get out; but be mighty sure of your ground before you make the move. Perhaps you imagine faults which do not exist.

Remember that the fellow who does not succeed in a small job never makes good in a big job. Doers of big things are always doers of small things.

No matter where you are, do your best for your own sake, even under the greatest handicaps.

If the man you work for represents the very superlative of meanness and unfairness, do not let that interfere with your own actions. You are primarily working for yourself, and you cannot throw all the responsibility upon your employer. Constant dissatisfaction and blaming the other fellow are responsible for many failures. Do not allow yourself to fool yourself.

Everywhere there is drudgery, and the blame is not located on either side exclusively. It is hard work behind the counter and everywhere else. Disappoint-

ments are of hourly occurrence. You must meet these obstacles or go out of business. Take an interest in your business or give it up.

Perhaps you are one of the great exceptions, and are working in a bargain basement, with a brutal man over you, and a hustling, jostling, cruel mob of customers after you. You are naturally tired, worried, discouraged, and, perhaps, sick. Your lot is a hard one, — a mighty hard one, — but lack of interest will not help you. Nothing in the world makes a hard job easier than to become interested even in the worst side of it.

When you are working for yourself, are faithful to your position, are doing your best even when on the rack of a bargain sale, the annoyances are not half so bad; and when you go home, tired though you may be, you have that restful, delightful satisfaction of feeling that you are true to yourself and true to your duty; and you will be ten times happier than you would be if you met unfairness with unfaithfulness and annoyances with lack of interest.

It is not the person you work for that counts the most. It is your work, and your work is you.

Above all, respect yourself and your position as much as you can, for it is you, not your employer, that you are working for, and you cannot be faithful to him, or faithful to yourself, or true to the better things of life, unless you enter your work, menial though it may be, with a respect for yourself and for the work you

do, always striving to do your best and with interest always alert, for these things, and these things alone, will give you peace of mind, reasonable happiness, and place you on the road to promotion.

You cannot, even under the most distressing circumstances, be wholly removed from opportunity, from a chance to better yourself. But this opportunity never comes to those not seeking for it. Promotion never reaches the idler behind the counter.

If you do your best, respecting yourself while you do it, you may, and probably will, better yourself; but if you do not, you have absolutely no chance of any kind of promotion.

If you have turned the half-hundred year mark, and are still behind the counter on a small salary, do not brood over it; do not limit your fault-finding to the man you work for; do not make a specialty of dissatisfaction.

The man who cannot get something out of anything — even the farmer on the rocky farm, who cannot coax unfertile soil to yield some kind of a harvest — is never going to get the most out of the most fertile ground and succeed under the most favorable conditions.

Make the most of the job you have, until you get a better one. Never find fault with your employer, without first examining yourself, that you may determine which is the more to blame.

Get hold of yourself. Remember that you are working for yourself. Change your tactics, if you can.

Become so interested in your business that you will get satisfaction from what you do, no matter what it is. Look upon the bright side of things.

Do not worry about the mistakes you have made, but rather think about correcting them. It is never too late to learn, and never too late to receive promotion. Make everything count, from the small things to the big ones.

The fault-finder is usually at fault.

The ship never came in to the loafer on the dock.

THE TRAVELING SALESMAN

PRACTICALLY all wholesale houses, jobbers, and distributers of every class of merchandise and of everything of every kind for sale, and manufacturers of everything which is sold, employ men and women, usually the former, to meet their trade and to sell goods outside of the place of business. These sellers are known as drummers, traveling salesmen, or traveling saleswomen.

Although practically every seller of goods to the trade employs inside salesmen, from seventy-five to ninety per cent of all sales, barring those of a few exceptional houses, are consummated outside of the place of business and through the intervention of the traveling men, who sell either by sample or by description, and most of them carry samples.

Theoretically the traveling salesman is not a business necessity, for it would seem to be obvious that the retail store-keeper, and other purchaser in trade, is, or should be, a trained buyer, who knows what he wants and when he wants it, and that he would purchase anyway, either by mail or by visiting the manufacturer or wholesaler.

But practically the reverse is true, comparatively few goods being sold by the impersonal introduction of samples and catalogues. Conditions rightly or wrongly require the presence of the traveling salesman and a

superabundance of personal solicitation. While this condition exists, and no change is in sight, the traveling man will continue to be a business-getting necessity.

The man on the road occupies a position of considerable importance. While the reputation of the house he represents, and the quality of the goods, go with him, his personality and ability come mightily into play, partly because he is representing his firm outside of its place of business, and, in most cases, he is the only one who comes in contact with the buyer.

It is obviously more difficult to sell goods away from the store or factory than it is on the premises. When trade comes to you, as it does if you are in a retail store or behind the counter, the customer to some extent takes the initiative. At any rate, his presence indicates that he is in a buying mood and is more likely to order something than not to at all. Under these conditions, a certain amount of trade will result irrespective of the ability of the salesman to handle the customer.

On the road it is different. The salesman must take the initiative. He cannot always know that his customer wants to buy or can be made to buy. True, he may, in some cases, make an appointment in advance of calling, but even then he is on the initiative side, and it requires more effort to take the initiative than it does to handle what comes to you.

The fact that one salesman can do a large business in a given territory, and that another connected with

the same concern cannot profitably handle it, the buying conditions remaining the same, is proof positive that the ability of the salesman to meet conditions, including opposition and competition, is a large factor in the consummation of trade.

But it is true, nevertheless, that a proportion, if not a large one, of failure to make good on the road occurs because the salesman does not use more than a small amount of his natural ability. He is indifferent or lazy. He does not post himself about his goods. He does not try to familiarize himself with the characteristics of his customer or with local conditions.

He approaches the customer hit or miss, tells his conventional story, and sometimes succeeds when he deserves to fail. He does not seem to care so long as he makes a few sales, yet he may have more than ordinary ability. Probably laziness, pure and simple, is the root of much of the trouble.

Trying, and trying hard, will lift many a man on to a plane higher than he supposed he could occupy when he started in to make the most of his ambition.

There are, of course, many men who cannot sell goods on the road. If they attempt to do so, they fail, and often miserably fail.

Selling ability, especially the quality which makes good on the road, cannot be created. If one has positive evidence that he cannot sell goods with any degree of success, he certainly should not make the attempt. If he is already on the road, and fails, no matter how

much effort he makes, and cannot seem to meet conditions after many and persistent trials, he had better consider some other vocation.

Nor would I advise one to become a traveling salesman who thoroughly dislikes selling or is not self-possessed. Some folks are born scared, and try as they do, they are too easily disconcerted to meet the vicissitudes which daily occur on the road.

The majority of great merchants have sold goods on the road, and most of them owe their present positions to their ability to sell under difficulties and to meet competition face to face.

But selling ability alone does not necessarily make a merchant.

Some good salesmen — men who are receiving high salaries — cannot command salesmen. They are able to sell goods themselves, but do not know how to direct others, nor do they seem to have general business ability. They remain salesmen, or if they do not, they fail.

The handling of business requires a different kind of ability than that necessary for salesmanship alone. Yet the ability to sell goods adds greatly to the making and success of the merchant; in fact, comparatively few men become great merchants unless a part of their experience includes the selling of goods. Proportionate figures are impossible, but I think that I may venture the statement that ninety per cent of our most successful merchants were at one time expert salesmen, and

that seventy-five per cent of that ninety per cent were able traveling salesmen.

An important part of business-doing is the direction of salesmen, and it is obvious that few men can successfully direct salesmen unless they are salesmen or have been. In the first place it is extremely difficult to obtain a knowledge of salesmanship without actual experience, and if one does not have it, he is not likely to command the respect of those under him.

Traveling salesmen are, as a rule, paid higher salaries than those received by inside salesmen. The majority of them receive a specific sum per week or month, and are allowed a reasonable amount for traveling expenses, which is supposed to cover everything except clothes and other personal items. The traveling salesman has, therefore, little board to pay. This is an advantage, if the man is without family, but does not count for so much to the married man with a family and home.

Some salesmen work entirely on commission, and pay their own traveling expenses; but the majority receive a specified salary and expenses.

Occasionally the salesman works upon both a salary and commission, or upon a guarantee.

It does not make much difference, because no salesman will hold his position if he does not make good, and a salary amounts to about the same as a commission, and a commission to about the same as a salary, except in exceptional cases.

Probably the best form is both a salary and a commission, or what is known as a drawing account against a commission, it being understood that the salesman may receive a specific amount whether or not his commissions meet it. This gives him a definite sum to rely upon so long as his sales are satisfactory. If they are not, he will lose his position eventually.

Life on the road is hard, except to the few who seem to enjoy it. Traveling is not easy, save for the tourist and pleasure seeker. The novelty soon wears off, and all hotels look alike and all food soon tastes the same. Traveling frequently means from one to six hotels a week, night journeys, indigestible food, long hours, and other annoyances, yet the man with the right stuff in him will make the best of these conditions, and they may not worry him if he attends to business.

So long as most of the sales are made on the road and the traveling salesman remains a necessity, the road will offer the best training for future success in the wholesale business, and the experience of traveling will continue to be necessary for the best rounding-out of profitable selling experience.

The traveling man has one advantage over the inside salesman. While the reputation of his house counts, his customers are to a greater extent his own, and he may have better opportunity to prove his worth to the concern he works for. This means promotion, and may lead to partnership.

I am not depreciating the advantages of inside sales-

manship, because the inside man has more opportunities than he is supposed to possess.

I have attempted to treat the other side, — the retail salesman's side, — in a chapter by itself, and to bring out the advantages and opportunities which accrue to him. The positions are different, yet great men have sprung from both of these departments of salesmanship. It is quite difficult to compare these two great classes, and the casual reader may feel that the two chapters are somewhat contradictory. Perhaps they are in spots, for it is next to impossible to be absolutely fair when one is handling a difference depending so much upon similar, yet dissimilar, conditions, and when so much is dependent upon personality, individuality, and capacity.

If one has much selling ability, and enjoys good health, I would advise him to consider selling on the road, provided he has reason to feel that he will not be obliged to remain there forever. Every man has a right to a family and to home life. This he cannot have more than nominally if he remains a traveling salesman. True, he can be married and have children; but if he is away most of the time, he cannot feel that he has a local habitation and a name, and he will be unhappy unless he is of Bohemian spirit, in which case he should not have a family at home or abroad.

In these days of severe competition and the centralization of capital, it is not easy to obtain a partnership or to become more than a subordinate official. There-

fore, the man on the road, if successful, may sometimes find it difficult to get away from it or to obtain so good a position at the home office.

The opportunities for partnership, and for residential positions, may not be as good as they used to be. The strenuosity of business, growing greater every day, requires that many of the best men remain on the firing line. But this condition should not deter one from going on the road, if he is ambitious, for he may have a much better opportunity of eventually obtaining a good residential position, if he goes there and makes good, than if he only realizes an indifferent success inside the store or office. I am referring here to wholesale houses and not to retail establishments.

Under present conditions the experiences of the traveling salesman seem to be essential to the training for success in the active side of the wholesale business, notwithstanding that not a few men have risen to the top who have never sold goods outside of the store. One of my best friends — a leader in his line — has never been on the road, and does not recall that he ever sold a bill of goods inside the store or out of it, yet he is a marvel at directing salesmen. He is an exception, that is all. But think of what he probably would have accomplished had he had selling experience!

It is a common belief among some people that the traveling salesman is simply a drummer and little more, that his experience and knowledge are limited

largely to the purely selling side of business, and that he cares for and practices little else. As a matter of fact, the first-class traveling salesman is a representative of broad business ethics, and is usually familiar with business in general, although he practices selling almost exclusively.

Unless he is a drone, in which case he is not likely to remain on the road, he has an exceptional opportunity to come in close contact with every phase of business life. Every day, and sometimes every hour, he meets different kinds of men. He is traveling from house to house, and from town to town, and he cannot avoid becoming familiar, not only with men, but with local conditions. He may not be book-learned, but he cannot help being world-learned.

I think there is more diversity of characteristics in traveling men than in any other class of business-doers; yes, or any other class of men not excepting those in the professions. To succeed they have to be alert and up-to-the-times, really up-to-the-minute.

Folks in general, and even some of the craft themselves, are laboring under the delusion that every traveling man, in method and in practice, is not unlike his fellows. While successful drummers practice good selling principles, comparatively few of them are exactly alike in method, each one having his own ideas and following them, provided they do not outrage accepted principles.

I have in mind four very proficient sellers of goods

on the road, and they illustrate the tremendous difference between traveling men.

The first is the personification of dignity, seldom utters more than a short sentence at a time, has little sense of humor, never attempts to crack a joke, and has hardly a perceptible smile for any witticism, light talk, or humorous story. He is not particularly prepossessing, and his personality is not striking; yet he was, perhaps, the best salesman of his class on the road, and possessed so much business ability that he was taken into the firm at an early age.

The second salesman I have in mind is one of the jolliest and wittiest fellows I have ever met. He wears a perpetual smile. He laughs and jokes with his customers, and has a round of stories which seems to cover the whole wit and humor of the world. When selling goods, he intersperses his arguments with witticisms, — always good and clean ones. Buyers look forward, as a rule, with pleasure to his coming. He sells goods, and I have heard it said that he sold more than any other in his line.

I recall the third salesman, who combines dignity with wit and good-fellowship. He is a great success.

The fourth example is a man who fairly radiates self-conceit, and is positively objectionable to his customers; yet by sheer persistency and a full knowledge of his product he has achieved remarkable success. Of course, he is an exception. If he were genial, he would do double the business.

In the ranks of traveling men are classical scholars, socialists, and men of deep learning; and these attainments do not seem to interfere with their work.

Perhaps one reason why these men succeed is because they are natural, they act themselves, they present what they have in their own way; but I would not advise any young salesman to copy their methods unless he is the same kind of a man, nor would I suggest that a naturally morose man carry his morbidness with him if he can get rid of it or cover it up. But I would say to all traveling men, that as they cannot successfully be anything but what they are, they had better be as they are, subject to proper regulation, getting rid, if possible, of the objectionable, and intensifying the good that is in them.

When you go on the road, go on with all your might. Make up your mind to win, to be so engrossed with your business that the annoyances of travel will count but little to you. You have a fight to make, and your future depends upon your victories.

Do not go on the road until you know about the house you work for, — its reputation, its position in the trade; — and, further, be familiar with the character of every house in your line. You must know, not only about the goods you carry, but of those sold by others. Learn about your goods from the ground up. Know how they compare with other similar goods, and be familiar with the policies of every house of your kind.

Do not fail to read your trade paper regularly. When you meet other salesmen, swap experiences with them. You are a member of a great traveling school of business, from which there is no graduation, for you study on forever.

Be so familiar with your goods that you can advise the customer. Be so genial and generous that he will be glad to see you. The chances are that you will carry nothing better than what others do, and that the prices will be about the same. Your success depends upon your personality, your ability to satisfy your customer, not only with the goods you sell, but with yourself.

On one side is the house you represent, on the other the one you sell to. Unless you are honest and friendly with both, and faithful to both, — unless every trade you make is of mutual advantage to you and to the buyer, — you are not a continuous success.

Respect yourself, and be proud of your firm. If you cannot be, get out. Feel that your position is second to none, or will lead to it; that you are the firm itself; and that everything you do reflects upon it as well as upon you.

It is your duty, not only to sell goods, but to aid the firm you work for with advice and suggestions. You meet the trade face to face, while the heads of your house see it by mail or through their salesmen. Keep your firm posted on selling conditions. Be a scout as well as a seller of goods. Feel that you are a

part of the firm, not a mere representative of it; that the firm's success depends as much upon you as your success depends upon it.

While away from your house, you are to the buyer the firm itself, the man most in evidence; and the more that you feel this responsibility, the more that you realize that you are working for yourself as well as for your firm, the more goods you will sell and the quicker you will rise from the ranks of the commanded into a commanding position.

While on the road, you will have some time to yourself, evenings for the most part, and during this off-time you will be by yourself or can be if you choose. Most certainly I would not advise a man to become a hermit on the road, to go to his room and stay there between his selling efforts. All of us need social intercourse and some amusement and entertainment. Contact with other salesmen is necessary for social enjoyment and is a profitable proposition. Without effort one can in conversation swap experiences of great selling value.

But do not spend all of your time talking or in any one form of amusement. Take up systematic reading, always along the line of your choice, provided it is elevating.

(See the chapters "What to Read" and "What to Do Outside of Business.")

Just a word to the home-folks and to parents in general: Some good people object to sending their

boys on the road because of the real or imaginary temptations which are said to surround every one away from home.

Undoubtedly there are temptations, and every salesman is subjected to them, but the fellow who has not strength enough to resist temptation away from home is not likely to keep straight at home. The weakling is sure to fail morally, anyway, and the slightest temptation throws him down.

Temptation was put into this world for a purpose, — to be overcome and mastered. The bad man on the road would probably have been a bad man at home. Temptation is not limited to traveling.

No one should refuse to go on the road because of the temptations which will surround him. If he has the right stuff in him, he will come out ahead. If he has not, he will go under, maybe quicker on the road than at home; but if one is going to be a moral wreck anyway, perhaps the quicker he goes to pieces the better.

Temptation is a stone in the pavement of the road to success. If it were not there, we should coast through life, and few of us would take the pains to learn to walk.

SATISFYING THE CUSTOMER

THERE are two factors accompanying every trade of every kind. On the one side is the seller, who is more anxious to sell than the buyer is to buy. At any rate, the salesman must assume this position. Naturally he wants to make the sale as profitable as possible for himself if he be the principal, and for his employer if he be the employee.

Probably in some cases he would ask more than a fair price, if he thought he could obtain it, although this would be bad policy in the end, for the unwritten law of custom, more or less affiliated with equity, right, and justice, does not permit a continuous outrage of its principles, and will not watch over and protect indefinitely the house which insists upon receiving a more than reasonable profit.

The truth of the foregoing statement may be questioned by those who are suffering under the present high cost of living and who believe that the prices asked are exorbitant.

My sympathy is with these people, because I am well aware that some trusts and combinations are demanding and receiving more than a fair profit. But the reaction is setting in, and it is only a question of time before civilization will reach a plane high

enough to control, or, at least, regulate, the cost or price of necessities. But the majority of articles sold are placed upon the market at a fair price, and do not pay the seller an exorbitant profit.

On the other side is the customer, who may or may not need the goods, and who can get, in most cases, the same thing, or something as good or similar, at the same price, of somebody else. He is not dependent, as a rule, upon any one store or firm or upon any one salesman. He is not, or does not appear to be, as anxious to buy as is the seller anxious to sell. He is, to an extent, an autocrat. He has a right, or exercises what he considers a right, to object to the price and to the quality. He makes as strenuous an effort to keep prices down as does the seller to keep prices up. He may be as unfair as the most unfair maker or seller of goods.

Here are two opposing forces, both likely to be unreasonable at times, and both willing to some extent to get the better of the other, neither always realizing that good business cannot exist except where the trade is a mutual exchange, of as much benefit to one as to the other.

Whether or not it is right or wrong to ask more than the goods are worth has not yet become a business ethic, and it will be some time before all business will be conducted along purely ethical lines and controlled by moral as well as by legal laws. For awhile some sellers will attempt to get all they can, and an

equal number of buyers will make as great an effort to purchase below a fair price. The principal difference is that the seller wants to receive more than his goods are worth, and the buyer wants to get more than his money's worth. The salesman is between these two factors, each more or less unreasonable, each sometimes demanding more than its due, and the salesman must satisfy both or go out of business. In justice to his employer he must obtain the price decided upon, and convince the buyer that it is right. He must take the quality, character, and price of the goods given him and make the sale, usually against competition, both fair and unfair. He must follow the policy of the house he works for or sever his connection with it.

On the other hand, continuous success is impossible if he does not consider the customer, for it is just as important to please one as the other, as sales cannot continue to be made unless both sides are satisfied.

Any misrepresentation, which is to the disadvantage of the customer, will sooner or later react on the salesman and the house he works for. Regular customers are not fools. Unless they are usually satisfied, they will discontinue doing business with the salesman and his house.

The salesman must not only satisfy the customer in the quality of the goods and the price, but he must be satisfactory as a salesman; in fact, this personal equation is of the utmost importance, particularly

when selling goods in open competition where the only difference appears to be in the personality of the salesman.

The customer should be glad to see the salesman, and like to do business with him, otherwise some other house may get the business.

The policy of the selling house may not appeal favorably to the buyer. It then becomes necessary for the salesman to reconcile the buyer to that policy, and to do this he must bring into play all of his personality and the good-will of his character. He cannot change the policy, but he must be able to change the customer's opinion, or to so ingratiate himself with the customer that he will not rebel against what he would not put up with if he did not like the salesman.

The successful salesman studies the likes and dislikes, the characteristics and eccentricities, of his customer, that he may not antagonize him, and that he may the better satisfy him. Unless he can make his customer glad to see him, inspire confidence in him, and, in the long run, be of actual benefit to him, either in a business or a personal way, or in both, he will do little selling.

The fact that from fifty to eighty-five per cent of all goods are sold through the intervention of the salesman, coupled with the fact that most everything is in duplicate, including prices, indicates that there is something besides quality of goods and price necessary for the consummation of trade.

This something is vested in the salesman, — the ability to give something besides the goods and the price. He must create a business friendship, if one of no other kind, and this is where his personality comes in, his general knowledge of men and things, his geniality, his courtesy, and his ability to size-up the customer.

If he is continually thinking of the policy of his business, and of exclusive faithfulness to his employer, to the detriment of his customer's interest, he will fail. And he will make as great mistake if he forgets his employer's interest for the benefit of the customer.

To succeed, he must represent both sides, his employer's first and to the greater extent; but he must not be forgetful of his customer's rights and interests. He is an agent of both, — a profitable go-between.

The shrewd and designing salesman may work off undesirable goods, may over-load the customer to his loss and to the transient benefit of the seller. This may give present profit, but is suicidal in the end. It does not build up permanent business. It never pays to over-load a customer, — to make him buy what he cannot dispose of or use.

The over-loaded customer is dissatisfied with himself, with the man who sold him the goods, and with the goods themselves; and, if these goods have been forced upon him, he is rightly prejudiced against the salesman and the house he represents.

Some salesmen even go so far as to under-sell rather than over-sell. They think that the customer will be better satisfied if he has to reorder than if he has a few of the goods left over.

Many a salesman has advised the buyer to cut down the size of his order, where there is sure to be a sufficient quantity of the goods on hand for immediate delivery when wanted. I know of one very successful concern, which has built up the second largest business of its kind in the country on the policy of advising the customer to buy what he wants when he wants it, and is continuously cautioning him against over-stocking. This house invariably satisfies the customer. It will not sell a line of goods, except under compulsion, if it feels that the buyer cannot use them to advantage.

The best salesmen — the salesmen who have achieved fame on the road or behind the counter — are those who never sell a customer what they believe will not be to his advantage; and they never force more goods upon him than they believe he can easily dispose of or use. By always feeling and showing a genuine interest, the customer becomes a friend as well as a customer, and the salesman has a personal influence over him, which he has fairly earned. He satisfies the customer in quality of the goods, in price, in the salability of the goods, and in his own personality. He does not ask him to buy what he would not buy of the customer if they exchanged places.

The salesman who cannot see the customer's side, and who is unable to work in the mutual interest of the buyer and seller, is not a real salesman and cannot expect to succeed.

The salesman is the solicitor — he takes the initiative. It is, therefore, his duty to satisfy the customer.

It is obvious that the thoroughly successful buyer will treat the salesman with the same courtesy and consideration that he expects the salesman to give him. But the buyer may, to some extent, do as he pleases, and yet succeed; while the salesman, to succeed, must satisfy the customer, whether or not the customer is satisfactory to him, and he must cater to that customer, help him and guide him, and subordinate himself to him up to the point of not losing his self-respect.

The dissatisfied customer does not remain a customer.

APPROACHING THE CUSTOMER

THE intrinsic value of proper presentation or approach cannot be over-estimated.

A prominent real estate agent once said to me:

"If you want to sell a house to advantage, have the approach attractive, and the front hall especially so. This condition, properly met, gives the best initiative impression."

Theatrical managers, especially, appreciate this, for theaters have most attractive entrances and their lobbies are well furnished and inviting.

First impressions are of major importance. They produce a feeling of good-will and cordiality and engender a willingness to go further, to make inquiries or an examination.

The buyer, who is met by the road salesman, may be busy or irritable and have a tendency to turn everybody down. If the first impression or the approach is pleasing and does not antagonize him, the salesman is given an opportunity to present his goods.

The same condition applies to the man behind the counter. The customer selects, if he can do so conveniently, the salesman who impresses him the most. He may judge superficially, and first impressions are not

always based upon reason; but they are inevitable and are going to count in practically every case.

It is difficult to always make a good impression, or to approach the customer to his satisfaction, for no one can diagnose every one correctly, and cannot know just how to act at the start every time; but if his manner is pleasing a part of the battle is won.

The languid, "don't-care" look behind the counter has spoiled many a trade and has driven many a customer to another salesman or to another store.

The salesman should always wear an interested and pleasing look, and should show his willingness to sell and to assist the customer. This look and manner must be cultivated, if it is not natural; and, if natural, developed.

The first word, or the first few words, with the right facial expression accompanying them, may be responsible for the sale. The appearance of cordiality attracts the customer and puts him in the right frame of mind, giving the salesman opportunity to do his best and to accomplish the most.

Perhaps you have some mannerism, which is obnoxious to most people, and if you have it, very likely you do not know that you have it. Nothing irritates more than some mannerisms do. If you know that you have one, get rid of it. If you do not know, inquire. This point should especially interest the traveling salesman, for he, more than the counter-man, gets close to his customer.

Be alert. Show your interest in your face and manner. Let the customer know that you want his trade, not by appearing over-anxious for it, but by being thoroughly interested and ready to meet him more than halfway.

The appearance of too much cordiality or too much persistency may be injurious, but better have too much of either or both than too little of them. Better be over-cordial than indifferent, and over-persistent than the opposite.

Your whole personal appearance counts, from your necktie to your shoes. Your voice and manner are parts of salesmanship.

If you are behind the counter and have no customer, be on the lookout for one. Meet him with your eyes and your whole manner, and when he approaches you, be so cordial and so interested that you cannot help making a good impression.

Do not hand things out, show them. Do not turn your face away from the customer. Keep face to face with him as much as you can. Cultivate the smile that stays on; but do not grin or be supercilious, and never patronizing.

Be independent and self-respecting, but do not forget the customer is your superior for the time being.

If you do not know how to properly make a first impression, watch others; watch them, anyway. See how successful salesmen do. If you are in a retail store and have any time off, get close to successful salesmen as

much as possible. Watch and study their facial expressions, their manners, their voices, and their methods.

The customer, especially the retail buyer, is a sort of will o' the wisp. He goes and he comes. It is often necessary to nail him with a glance and hold him with a word.

As the first impression comes first, it is of first importance. It is the gateway to success in selling. Many a man of little selling ability has done well because of his manner, his cordiality, and his fervent interest in the customer.

It may be hard work to look happy and to dispense cordiality when your liver is out of order and your customer is not a gentleman. It is not easy to sell goods anyway, and I know of no easy business anywhere. If you feel all right, show it on your face and in your manner. If you do not, then act as though everything was going smoothly with you. Your customer cares nothing about your troubles, and you have no right to burden him with them.

The control of yourself, and the ability to radiate cordiality and good-will, are things which must be cultivated and maintained, if one would succeed at selling. It is necessary for you to have yourself under such control that you can immediately bring the best of you into your face and manner, that you may make a good impression at the start.

But do not forget that a good first impression is

worth mighty little if it fades. Good first impressions must be followed by good second impressions.

First sales are of great importance, and often difficult to obtain, but their value is dependent largely upon their continuance. It is the same with impressions.

A good start is pretty likely to lead to a good finish.

FORCING A SALE

FORCE, or coercion, or undue or over-pressure, must never be exercised, if one would make a permanent customer, except when the customer is vacillating or appears to be unable to decide for himself. But, even then, the salesman should use great caution, and should not apply force or use strenuous methods, if they will be apparent to the customer.

The salesman who earns permanent success usually appears to be, and is, working in the interest of the customer as well as of the house he represents, and is impressing upon him the great selling fact that the principle of correct business-doing is based upon reciprocity, — a desire to produce a mutual benefit.

Where the customer is vacillating, does not seem to have a mind of his own, and shows weakness and indecision, the salesman may be justified in using force, provided the customer will stand for it, and provided the salesman knows how to properly use it and to so disguise it that to the customer it appears to be earnestness rather than force, and friendly advice rather than coercion.

Many young salesmen, anxious to make a sale, crowd the customer; and, although they may succeed

at times, they are not likely to leave a good impression, and this operates against them, perhaps for years to come.

Do not misunderstand me, and do not think that I am opposed to strenuous methods, or a display of earnestness, even if they approach vehemency, because they are often necessary. But I would emphatically advise the salesman against crowding or driving the customer, against forcing him to do what he is sure to be sorry for afterwards. A forced sale, or a sale against the interest of the customer, even though the method used may not antagonize him at the time, is sure to have boomerangic effect.

The salesman must not only make a good first impression, but he must so handle the customer, and so sell him, that the favorable impression given will remain. Unless the trade satisfies the customer after the goods are delivered, the hard work done by the salesman is likely to be lost so far as subsequent sales are concerned.

The refusal to crowd, force, or coerce, in no way interferes with persistency and positiveness, both of which are necessary to the consummation of most sales, for the customer expects the salesman to be both persistent and positive and has little respect for the salesman who is not. But no customer worth having will stand crowding or coercion more than once, and may refuse to see the salesman when he calls the second time.

These principles apply to retail selling as well as to selling on the road.

Even the supercilious, vacillating, namby-pamby, retail buyer likes to feel that the goods were not forced upon him.

Once in a while force may be necessary, but when it is used it should be so covered up that it will not be recognized by the customer.

Assisting the customer, suggesting to him, helping him to make up his mind, is not in any sense forcing the customer. Many a buyer, especially one before the counter, does not know what he wants, and no sale is possible unless the salesman helps him out by advice and suggestion. To do this does not require any form of coercion, for it should be given in a friendly, interested way, so put that the customer will be really thankful for it, and go away without any feeling that the goods have been forced upon him.

EMPLOYER AND EMPLOYEE

THE doing of all business, and the management and action of all commercial affairs, from making the goods to the selling of them, require the services of two classes of workers, — the employer who during working hours is in command of the employee, and the employee who during the same time is under the direction of the employer.

This condition will exist as long as there is necessity for business accomplishment. Somebody must direct, and others must follow directions. Without the leader and the led, all work would be that of the mob, — disconnected, useless, and undistributed.

Quite naturally the unperfected state of business, and of all other present action, creates and maintains abuses. The employer is not always fair, nor is the employee. Often they are, without justification, antagonistical to each other, many an employer demanding more work than he pays for, and many an employee being unwilling to earn his pay.

This condition is due to our lack of development, which will continue to breed unfairness, extortion, laziness, and even cruelty.

I do not propose to discuss capital and labor, nor to dwell upon the abuses practiced by some employers and the unfairness of the business men who seem to

feel that they, as hirers of labor, are made of different stuff and feed upon different meat, when, perhaps, at the start, they were lower mentally and financially than some of the poor fellows who are unfortunate enough to work for them.

Until the Golden Rule becomes a part of our code of law, a proportion of employers will be unfair and unkind and even cruel to their employees, and will see things only through their own glasses, with charity towards none.

Unfortunate, indeed, is the worker who finds himself under the lash of these men. The only thing that he can do is to get out at the earliest possible moment.

I am addressing my remarks to the salesman's side of the question.

It is the employee's duty to do his work in a business-like way, to be honest and square, faithful and reliable, whether his employer be a good man or a bad man, a fair master or a tyrant. The employee is working for himself, no matter how low down he may be. It is his duty to be true to himself, and he cannot be if he is unfaithful to the man he works for.

All of us began in the ranks, and our promotion is dependent upon the services we render, — our faithfulness, our obedience, and the development of our ability.

A large part of so-called unfairness on the part of the employer, and much of the cause of dissatisfaction, are imaginary. The employer in his unfinished state,

for none of us are fully developed, sees the world from his personal viewpoint, and, unfortunately, not always from that of the employee. He should be fairer because he began as an employee, and has had better opportunity to see both sides; while the employee, on the other hand, cannot very well view conditions except from his own standpoint. He has not as yet become an employer. Therefore he may be unreasonable through ignorance and inexperience, and it is quite likely that he will often imagine abuses which do not exist.

Discipline is necessary for any action, and it may appear to the disciplined to be unfair and unjust, because those in the ranks have not as wide a circle of experience.

The captain of an army or the manager of the business is carrying out a policy, which, to be properly met, must employ certain rules and regulations, and which does not always allow him to discriminate with absolute equity. He may be unfair without knowing it. He has under him a number of men, some of them honest and some the opposite, some active and some lazy, some satisfied and some dissatisfied, some fair and some unfair. To an extent he has to handle them at arm's length. He cannot take all of them into his private confidence. He has not the time, and may not have the inclination, to get as close to them as he should. He places them under discipline, some of it more or less automatic and arbitrary, because there appears to be no other way.

Undeveloped man, and none of us are close to the point of perfection, cannot dispense discipline as his better nature would suggest if it had a better opportunity.

The majority of employers intend to be fair, are considerate, and appreciate the work of their employees. They are so, partly because their good nature predominates, and because it is good business policy to be.

The employer is as much dependent upon the employee, collectively, as the employee is dependent, individually, upon the employer. But here is a difference, which many of us do not take into consideration: The relation of the employer to the employee is collective, or in mass, so to speak, except where there are few employees; while, on the other hand, the feeling of the employee towards his employer is individual or personal.

This condition is responsible for much of the existing trouble, — the employer sometimes looking upon the employee as a machine, and the employee demanding, at times, more personal recognition than the employer can possibly give if he would handle his business as business has, unfortunately, to be conducted.

The good and successful employee or salesman attends to his side of the business, and does not continually find fault with the man he works for, whether or not cause exists. He is gunning for business, and not hunting for trouble. He does his work faithfully and cheerfully, renders the best possible service, and accom-

plishes something in the end that must command the respect of any employer who is twenty-five per cent man.

If conditions are unbearable, he throws up his position, but only after deep and long consideration. He realizes that his employer has troubles and annoyances which no employee has to bear.

The employer carries the weight of the load. Business is hard. Profits may come slowly. There may be frequent losses. He may have to force himself against the current and may be among the rocks. He may have more money and great luxuries, but these come often from over-work and continuous worry.

Some men prefer to remain employees, and are better satisfied with good salaries and the minimum of worry than with commanding positions and the maximum of anxiety.

I am about to say something which may be misunderstood: No one believes in the equality of man more than I do. The man who does his best, whether he be a boot-black or the president of a corporation, is, or should be, recognized to be the business and social equal of any other man or of any body of men. He who does all he can, however little that accomplishment may be, is as great and as worthy as he who has conquered half of the world and expects to command the rest of it. No man can do more than his best.

The doing of business appears to be necessary, and to be a part of our education, leading to better things.

At any rate, business is going to exist for many years to come, and the improvement of business methods will necessarily be slow. For the present, and for some time, there will be a line drawn between employer and employee. The employer, for the time being and during business hours particularly, occupies a position superior to that of the employee. He may be mentally deficient and socially beneath some of those who work for him. He may have less intelligence and far less education. Some of his employees may be better able to command than he is; but, so long as he is in at the head, he must be obeyed; and the employee, like the soldier in the ranks, who refuses to follow orders, will never reach a commanding position.

Few men ever successfully handled a sword who had not as successfully carried a gun, and the great principles of military tactics apply with equal force to the action of business.

If you would look forward to a high position, if you expect the management of salesmen, if you would be ambitious and anxious to become a member of the firm, respect your employer while he is your employer and as your employer. Obey him in all that is right. Look up to him. Honor him. Even admire him and be proud of him, and always recognize him as your superior officer, better able to command you than you are to command him, until the time comes that you become commercially a fellow officer with him or his superior officer.

So long as you sell goods, you are rightly under the direction of somebody, who for the present is your superior, and who at the helm is better able to lay the course than are you who have never seen the chart-room and who are before the mast of business.

While you are in the forecastle of salesmanship, and have not become a ward-room officer, take off your hat to the man on the bridge if you would do your work better and gain promotion quicker.

Do not allow yourself to feel antagonistical toward the man you work for. Do not question his policies and his methods, unless they be dishonest. The fact that he is above you is *prima facie* evidence that he knows more than you do, has had more experience, and is entitled to his position. The better you work for him, the better you work for yourself; and the more you appreciate and honor the position you occupy as an employee, the quicker you will carry the sword of business, and wear the sash of honor, and command a company of workers.

WORKING FOR YOURSELF

EVERY member of the great and ever-increasing army of business, and every one connected with any kind of activity, either is in command of others or is under the command of others; that is to say, he is in the ranks, subject to constant orders, or he is in front of the ranks constantly giving orders.

Yet no one, not even the commander-in-chief, is wholly in charge of himself or of anybody else; and no one, even the slave, is entirely under orders.

The great commander, although his power may seem to be as broad as the field of all outdoors, is under some sort of discipline. He is subservient, at least, to the dictates of public opinion and to public policy. Therefore he is not, and never can be, the supreme authority.

The proprietor of the great department store, a massive structure housing two townfuls of workers, may seem to handle his business as a czar and to be beyond the slightest interference from others, yet he is the servant of his customers, is controlled by the composite policy of them, and is never thoroughly independent.

The great banker, who seems to be able to jingle in his hand the gold of his country, is not independent of banking interests, and is controlled by written and

unwritten laws made and enforced by the composite body of which he is a part.

We are all dependent upon others and subservient to conditions, — members of the working army of activity.

But, broadly speaking, there are two classes of workers, — the employer and the employee, — one in command and the other under orders; yet no one in whose veins runs a drop of red blood is wholly subservient to orders, for every one is in some command of himself, whether he be a hod-carrier or the controller of a railroad.

It is impossible to render efficient service unless the doer commands himself to do what he is commanded by others to do.

The salesman, even though he may be smarting under the discipline of the firm he works for and is under rigid rules and regulations, does not and cannot make more than an indifferent success, unless he feels that he is working for himself while he is working for another, unless he appreciates and honors his position, and feels responsible to himself for the work he does.

He must obey orders and follow the policy of the house he works for. He cannot personally settle the great questions for the firm, but he can settle great questions for himself and remain in command of himself while he is taking and following orders from others.

Unless he realizes that he is working for himself, no

matter how menial may be his position as an employee, he will never produce results worth while, either for himself or for anybody else.

Do not think that I am asking you to feel so important that you will chafe under the harness of discipline. So long as the world lives there must be commanders and commanded, and disobedience to orders invites failure; but there is a difference between being a bloodless machine or a mere puppet pulled by the invisible string of a regulator and the ability to respect yourself and to respectfully follow the direction of your superior.

The successful salesman cheerfully obeys orders, honors and respects his commander; yet, at the same time, he considers that the man he works for and himself combined constitute his real employer, and he is never forgetful that in whatever he does, whether he follows strict orders or not, he is first responsible to himself.

If he is not working for himself, he is not working at all, except as an automaton. If he is not proprietor of himself, he is unworthy of the bark of a friendly dog. If he does not appreciate and respect himself, and feel his personality and individuality, it is because he does not have any, and he is not, and cannot be, a salesman. It is impossible for him to do any effective work unless he is a partner in the transaction. To amount to anything he must consider himself a member of the firm. The more he feels it, and the

more he acts under this inspiration, the better off are his partners, his employers.

The highest self-respect does not interfere with discipline. The bravest soldier on the field is the one who respects himself so much that he can respect his commander, and he obeys orders, not wholly because they come from his superior officer, but because proper self-respect and intelligent policy command him to do as he is told to do.

The trouble with many employees, and especially salesmen, is that they do not sufficiently respect themselves to keep them from chafing under discipline and from cheerfully following orders. Because of lack of self-respect they have a false idea of their rights and a childish desire for independence. They forget that the discipline over the under-man is necessary to fit him to become the over-man, and that the harder one works for another, and the better he carries out another's policy, until he has a right to have one of his own, the more he is really working for himself and building up for himself the great asset of success, — reputation.

Every employee, whether he sweeps out the office, or dusts the desk, or stands behind the counter, or sells goods on the road, is from the start primarily working for himself, and a realization of this is the first step up the ladder of fame and fortune.

Duty to oneself is as important as duty to another, for self-duty enables one to better perform outside duties.

One cannot have too high a respect for himself, for respect does not exist without justification. Self-conceit is an entirely different affair. Self-respect does not make one wear plumes and strut through street or office, but enables him to properly measure and gauge himself and to do his best wherever he may be, and to respect himself as much when following orders as he would if he were giving orders.

The man who cannot with self-respect follow an order will never be permitted to order anybody else.

One of the reasons why so many remain in subordinate positions is because they do not realize that they have two commanders, — themselves and their employers, — and because they do not recognize that great law of business, and of profit, which does not permit the man who is unfaithful to himself to ever be faithful to others.

If you would succeed, no matter what your position may be, realize that you are both an employer and an employee, that you are your own commander first and always, you as commander of yourself taking orders from your superior officer, your employer. So long as you respect yourself as both your employer and employee, and your employer as the general-in-chief, following orders, not as a servant even though you occupy that position, but as a self-respecting worker, you are on the high-road to achievement.

ANTAGONIZING THE CUSTOMER

I HAVE reason to believe that there exists somewhere a perfectly calm, well-balanced, and nicely poised individual. I think I have seen him, but I may have been mistaken. The fellow I saw, however, who was supposed to have reached and to have maintained hair-spring equipoise, was a next-to-worthless sort of chap, physically sluggish, and with a mentality incapable even of disease. He was simply an automaton.

Most of us, especially if we amount to anything and are able to originate and do things out of the common, are not usually perfectly poised and are not always in good command of ourselves. Some of us seem to be born with the proverbial chip upon our shoulders, and by look and by word enjoin every one we meet to knock it off that we may have excuse for retaliation.

Lack of poise is a part of human nature, or, at least, of the brand now prevailing. For the present it cannot be fully conquered, and, perhaps, it will remain forever a part of the every-day world.

The strenuous life we are living, and the continuous tide of sorrows which flows deep enough to drown us, keep us on edge, and it is easy for us to slip and fall. Things which should not affect us at all, or concern us but slightly, often trouble us the most. We are

raw, and filled with mental sores, which pain us from the inside, and which, combined with outside annoyances, naturally make us morose and irritable.

This self-made and absorbed irritability antagonizes those we come in contact with, partly because they have similar troubles, for when trouble meets trouble there is a doubling up of trouble.

Every buyer is likely to be more or less worried, either in business or at home. It will not take much to throw him off his center.

The salesman may be in the same condition. Things do not run smoothly with him. It is natural for him to want to vent his troubles or his spleen upon the customer, and by so doing he cannot help antagonizing him, or irritating him, or doing something, or showing something, which is not conducive to the consummation of a sale.

There are some people who seem to have a naturally antagonistical disposition, who think they are worried or troubled whether they are or not, and who appear to delight in opposing those they come in contact with. This is undoubtedly a disease, and must be so treated, for it is obvious that no person would in his right mind deliberately injure himself that he may injure another. But it makes no difference whether we are antagonistical for cause or without it. We must conquer the outside appearance of it if we would be more than mediocre salesmen.

If we are worried and troubled, and feel like antag-

onizing every one we come in contact with, and seem to have a morbid delight in opposing others, we must get rid of that feeling, and act as though we had a glad hand for all the world, or else we must give up trying to sell goods and get a job flagging a train or standing as night-watchman for a house in the wilderness.

If the customer wanted to buy as much as the salesman wanted to sell him, the salesman could do as he pleased. But, as the salesman is the solicitor, — the asker, — he must maintain his equilibrium if he would effect a sale.

I have already said that comparatively few salesmen sell monopolies, that the customer can usually get what he wants without patronizing any one house. This being the case, the personality of the salesman counts mightily, and justifies me in making the statement that the chief reason why some people will not buy of some salesmen is because the salesmen antagonize them. They rub the customer the wrong way. They wear their troubles on their faces. They allow even a justifiable irritability to show, or they appear to be too important and to have more conceit than self-respect. If the customer gives them provocation for being disgusted, they show it at the sacrifice of good judgment and business, or they may over-force their goods and throw naked advice at the customer.

The customer wants a certain line of goods or a particular pattern. The salesman does not have it,

and he, in a supercilious way, crowds an unwelcome article upon the customer, forces upon him gratuitous advice in allopathic doses, and he makes the customer feel that he has no judgment, and that the salesman thinks he knows it all. Immediate antagonism sets in, or the salesman, for the best of reasons, objects to the purchase of certain articles, and, instead of advising the customer as a friend to buy something else, he expresses his objection in an arbitrary way, completely off-setting his good intentions.

Many a salesman is perceivably filled with a sense of his own importance. He appears to condescend to wait upon the customer, to make him feel that he is doing him a favor by waiting upon him. The opposite is right and good business.

Perhaps the customer cannot afford to buy first-class goods. Nothing interferes more with a sale than to make him ashamed of his limited pocket-book.

If the woman wants to purchase only a paper of pins, and second grade at that, so long as the quality will answer her purpose, or she cannot afford to buy what would be cheaper in the end, it is bad policy to give her any advice which she cannot take advantage of. If she is making a grave mistake, and there appears to be no reason why she should not buy something better, then advise her, but do it with care.

The stores which have built up a lasting and enviable reputation are those which recognize all customers as equal, whether they be poor or rich, sensible or

foolish, and which carry in regular stock ready for immediate delivery a complete assortment of good-will and courtesy.

While you are selling goods you must maintain your balance or you will fail. If you feel in an antagonistical mood, go away by yourself and take it out on yourself. Get rid of it, or cauterize it, before you meet the customer.

I am talking business fact, — cold-blooded selling fact. You must rid yourself of that antagonistical feeling or go out of the selling business. There is no other way.

When a customer asks for information, do not snap it at him. He has a right to ask foolish questions, and it is your business to answer them to the best of your ability. You probably would be as foolish on his ground as he is on yours.

Make every customer feel that you appreciate his orders.

Do not say: "Will that be all!" as though you were not satisfied with the size of the sale. You may politely suggest something else, or call his attention to some article; but make him feel that you appreciate his cents as well as his dollars. At least appear to value the five-cent buyer as much as the five-dollar purchaser.

If you offer advice, give it in a suggestive way. Never forget to say "thank you," or to use some other similar expression. Say something, if only a few words about the weather, which shows cordiality and

appreciation. Make the customer feel glad that he has bought of you and proud of his selection. If you switch him off from one thing to another, make him feel that he has done it, not you; that you brought these things to his attention, allowing him to make the decision.

If you find that certain expressions appear to antagonize the customer, change them for others.

Experiment with your tongue as well as with your manner, and strike a happy medium.

With a little effort, if you have selling instinct, you can tell whether the customer is pleased or not, or whether you antagonize him or not. Then do differently next time, if what you have done does not produce results.

You are going to antagonize a few, for the combined efforts of a thousand angels, multiplied a thousand times, will not satisfy some customers.

But the majority of people respond to politeness, and will appreciate the courteous salesman, even though they may appear not to do so.

Never wait for the customer to meet you. Be a little ahead of him. Anticipate his wants if you can. At any rate, appear to be interested. You must cater to him whether he be unreasonable or not, and keep from antagonizing him. If he is half-decent, and you are all-decent, you may succeed in selling him. If you do not, let the fault be his or the goods, not yours.

GETTING ACQUAINTED WITH THE CUSTOMER

THE better you know your customer, and the more you know about him, the easier you can handle him. Comparatively few sales of any magnitude have been consummated between strangers. An acquaintance with the customer, personal or limited to some knowledge about him, appears to be necessary, and probably is, for most sales of consequence.

The traveling salesman considers it his duty to know something about the buyer before he approaches him. Of course, he does not refuse to meet the man he does not know or knows nothing about; but, if it is possible, he carries with him some general or specific knowledge of the person he proposes to meet.

It is obvious that the counter-man cannot know all of his customers or know anything about them, and it may be impossible for him to become at all acquainted with many of those he meets; but he should make an effort to become acquainted with them, to discover their likes and dislikes, their temperaments, and the quality and quantity of their buying. With this knowledge he can better present his goods and much easier consummate a sale. He can become acquainted with some of them, or learn something about them,

even though they may not feel acquainted with him.

There is a social side to selling. Few good buyers or good salesmen exclusively confine their conversation to business. The buyer often speaks of other things, and he expects the salesman to meet him half way, and the salesman may at times take the initiative if he is acquainted with the customer or knows something about him. This acquaintanceship, which may ripen into friendship, places the salesman in a profitable position.

Of course, one must not be objectionably familiar, and should not forget that business is business, and that friendship is not universally considered a part of business. But acquaintanceship, with or without friendship, is always to be desired.

The bright salesman will get inside of his customer, so to speak; find out about him, know him, and be, therefore, prepared to meet him on his ground, to do and say things which he wants, and to create a certain social atmosphere in trade which smooths the rough edges of business-doing.

While it is impossible to become acquainted with all customers, or to know anything about more than a proportion of them, quiet inquiry will bring to the salesman a vast amount of workable knowledge of who and what the customers are and of what they like and dislike.

Traveling salesmen can easily obtain advance

information from the salesmen who preceded them, or from other salesmen, so that they seldom find it necessary to meet a buyer entirely unknown to them.

The reason why many retail salesmen do not know their customers is because they make no effort to become acquainted with them. They act as automatons, selling a customer if they can, and without making any effort to bring him back for subsequent purchases. They seem to be satisfied with the first sale, and take no thought of the second, notwithstanding that any sale following the first sale is likely to be much more profitable.

Many a salesman is more of a waiter than a coaxer of trade. He stands behind the counter and does what he cannot very well help doing. He does not volunteer or take the initiative. He is not a true salesman, and because he is not, he receives a low salary, which is probably as much as he is worth. So far as one can see, he has no interest in the store he works in, the goods he sells, or the people who buy them. He is not promoted, because he does not deserve to be. His customers appear to pass before him like moving pictures on a screen.

Often we find one who respects the man he works for, who is interested in the goods he sells, and who is not indifferent to the customer. Unless the concern is of the lowest order, this interest is appreciated, usually substantially.

Part of the success of this salesman is due to a sort

of informal acquaintanceship he has with his customers. He may not know their names, but he knows them, and they may not know who he is, but they feel acquainted with him. Between this salesman and the customer springs a sort of friendly acquaintanceship, a something which makes it easier for them to trade together.

Probably, in most cases, he has become acquainted with his customers from coming in contact with them. From their own lips and from their own manners he has ascertained their characteristics, their likes and dislikes. He knows something about them, and can, therefore, handle them to advantage; yes, to mutual advantage, for this sort of business initiative enables the seller to sell at greater profit and the buyer to buy to greater advantage.

The traveling salesman knows, or should know, the name of the buyer, that he may address him by name. This condition cannot universally prevail behind the counter, but a little effort on the part of the salesman will enable him to call many a customer by name.

Nothing pleases the customer more than to be addressed by name by the salesman he does not know. It almost invariably creates a good impression and establishes a sort of friendship. How much better it is to address a lady in front of the counter with "Good morning, Mrs. Smith," than with "What can I do for you, madam?"

Every store has regular customers, even though

they may not carry charge accounts. A proportion of the goods are delivered, and the salesman has the opportunity of ascertaining the name of the customer. He should remember it and the face, that he may address him by name the next time he calls. After he has found out the name of the customer, it is well to repeat it often, but without over-doing it. If a customer is making extensive purchases, it is easy to address him by name from twice to a dozen times during the sale. This simple art of knowing the name, and of using it, has great selling value.

Do not think that you cannot become acquainted with some of your customers, or that you cannot learn their names. You can if you want to, and if you want to you are sure to make the necessary effort. If you do not do it, it is because you will not, not because you cannot.

PERSONAL APPEARANCE

THE outside of man or of woman does not make either of them or stand for intrinsic quality and real ability. Among folks who think and have well-thought-out ideals, dress and other personal adornment count for practically nothing. They are known by what they are and they judge others fairly.

But business is an entirely different proposition. Its ethics are its own. It is arbitrary and commanding, always doing as it pleases, sometimes outraging the better part of life and establishing a code of morals which are not more than technically right.

Fortunately or unfortunately, men of business are judged to an extent, often to a great extent, by their personal appearance.

Because our clothes are always in evidence, what we wear, and all parts of us which can be seen, are of commercial consequence.

The over-dressed man and woman never command respect even among their kind. Over-dressing is against good taste, good morals, good breeding, self-respect, and good business.

Business ethics demands that its people dress becomingly and make a neat and appropriate appearance, of which extravagance is not a part.

True, some salesmen are of unkempt appearance, and are often actually unclean; and yet they sell goods in spite of that; but it is certain that they would do more business if they gave attention to personal habits and appearances.

But do not forget that even the best clothes made by the best tailors do not add to one's appearance, if they are not kept clean and are not in harmony with the face and figure. Clean clothes are more essential than good clothes.

The inexpensively dressed man, with shoes blacked, his clothes well brushed and pressed, makes a better appearance, and is better attired for business, than is he of fashionable but untidy garments. Perhaps you cannot help looking shabby, but you can look clean.

The well-dressed person, or, rather, the properly dressed person, is one whose clothes attract no particular attention, because they are in such perfect taste that no one part of them can stand out in relief. If there is something startling or striking about the dress, the owner will be known by the clothes he wears, and this is against him. No one should be conspicuously dressed, for conspicuousness is always in bad taste.

Comparatively few of us can tell how the well-dressed person is dressed. We simply know that his garments are appropriate and in harmony with him.

Proper dress is a part of the person wearing it, and harmonizes with him, and he is seen as a completed

whole and not recognized by any particular pattern, or fabric, or necktie.

Finery, and especially cheap finery, should be avoided. The gaudy watch-chain is in bad taste, and so is the flashy necktie, or any conspicuous display of jewelry, or anything else for show only.

Not only should we be comfortable, but we should look comfortable.

There is no excuse for unblacked shoes or for the unshaved face. The linen should be spotlessly clean.

No man should use perfumery, and I see no reason why this rule should not apply to women.

Women, especially, should avoid that loud or flashy look which so many seem to think is a necessary part of business.

The hands should be clean, and the finger nails well taken care of.

Many a woman injures her commercial value by the dress of her hair. If she does not know how to do it up properly, let her consult some one who does.

Business men and women should dress to please others, not themselves, to be acceptable to the majority of people they come in contact with.

Adornment for mere personal gratification is sheer selfishness and shows the very extreme of personal vulgarity.

Neatness is always essential, from the top of the head to the bottom of the shoes; and outside neatness is impossible without inside cleanliness.

The face is, to an extent, the mirror of character. At any rate, we are often judged by our facial expression and appearance. Clothes should, therefore, harmonize with the face and figure. A fabric which looks well on one may injure the appearance of another.

Many of us make a mistake by constant change. We over-rate the value of variety. We do not want two suits alike, or anywhere near alike, and this change operates against our outward appearance.

I do not mean to say that one should wear the same fabric all of the time, if one particular kind becomes him, but I advise him not to depart far from an acceptable style and pattern.

Loud styles and patterns should always be avoided. When in doubt, use the plainest designs and the simplest cloths.

The foolish woman, who over-dresses herself, who turns her body into a frame for the hanging of ultra styles, despises the woman who looks as she does, for no woman, not even the worst offender, has any respect for the over-dressed. Conspicuous clothes should be limited to the stage. They have no place in every-day life.

Unusual adornment, and the attempt to look smart, antagonize the buyer, even though he or she may be superlative monuments of the vulgarity of style.

The tendency to over-dress on the part of the fresh drummer is to be deplored. He may do business in spite of making an ass of himself.

The girl behind the counter can do little to greater injure herself and her trade than to make a show of herself by the striking appearance of her clothes.

We are nearing an age of simplicity. Simplicity has become an art. Our best people are applying the principles of simplicity to the clothes they wear.

So long as you remain a salesman, you, as well as your goods, are for sale, or, rather, you are a part of the transaction. While you occupy this position it is as necessary for you to well present yourself as it is for you to well present your goods. You cannot separate the two.

If you would do good business, carry to your buyer the best you have in merchandise, and the best you have in actual self and in the appearance of it.

GOOD NATURE IN SELLING

THE selling-end official of one of the most successful American corporations, employing a small army of salesmen, said to me, in all seriousness and emphatically, that he considered good nature the greatest essential to profitable salesmanship. He claimed that his observations and experiments, covering a period of a quarter of a century, led him to feel positive that this quality — good nature — was worth more than anything else in the consummation of trade.

The reputation of his house is world-wide, and to my friend is due in no small measure the international position which it occupies. He is in charge of the salesmen and of everything pertaining to the output of the product, and is, therefore, largely responsible for the selling success of the business.

What he says is worthy of the greatest respect, and I would not take exceptions to it, if other equally proficient managers of salesmen did not differ from him in not placing good nature at the apex of the selling monument.

But whether he is right or wrong, good nature is one of the prime essentials to successful salesmanship. Without it, it is well nigh impossible to sell goods, except to the few who insist upon having what is offered.

The over-dignified man, or he who is morose, whose face is lined with a map of disappointment, cannot rub elbows with the trade or extend the glad-hand to anybody.

While too much familiarity is objectionable and defeats many a sale, good nature, even too great a display of it, makes no enemies, is sure to create a good impression, and is largely responsible for the formation and maintenance of business friendship.

Notwithstanding that the action of business is often heartless and sometimes cruel, and that sentiment is not supposed to enter into the composition of trading, there is such a thing as friendship in business.

So long as human nature exists, likes and dislikes will play leading roles on every stage of life. Many of our firmest friendships grew from business connections, and many a buyer and salesman are chums.

It is said that it does not pay to do business with friends and that it is unprofitable to cultivate friendship between buyer and seller. Perhaps the statement borders on the truth, but it is a fact that the first-class buyer and salesman usually meet harmoniously and profitably upon both the business and social field.

As a rule real friendship does not interfere with any action, and is an aid to selling and to business-doing. Therefore, anything which contributes to it benefits the parties involved.

Do not misunderstand me. I am not asking the salesman to become the chum or the intimate friend

of his customer. This condition would be impossible, except with a selected few; but I do say that good fellowship between buyer and seller not only robs selling of much of its disagreeableness, but is a profitable asset which should be cultivated by both sides.

There are expert salesmen who seem to live within the hard shell of an assumed but never a natural dignity, for natural dignity is approachable. These men succeed, or, at least, they are not failures. They smile not, neither do they laugh. They have no sense of humor. Their action is automatic, and automatically they work.

But take the great rank and file of successful salesmen, whether on the road or behind the counter, the men who do business are usually those who radiate good nature.

The buyer may do what he pleases. He is seldom obliged to trade with any one man or at any one store. He has, or he assumes, the right of discrimination for and against the goods and the seller of them. If he personally likes the salesman, he is glad to see him or does not object to seeing him; and if he sees him and talks with him, he places himself under his influence. If the salesman has a pleasant face and manner, he will do much to dispel the gloom which is often present in the buyer's office; and this radiation of cheerfulness cannot help adding to the selling chances of the salesman.

Many a man with a thorough knowledge of his

goods and an ability to talk understandingly has failed to make good because of his lack of cheerfulness and of the shadow he casts around him when he attempts to present a selling argument.

But avoid being too familiar, particularly with the buyers you do not know well. Good nature does not need to descend to that. It does not have to travel on a train of jokes or depend upon funny stories, both of which have their places.

The good nature which is a selling asset is that dignified or well-regulated cordiality, that lighting up of the face, that seeming to be on good terms with yourself and the world, that something which makes people glad to see you and sorry to have you go; and if they are glad to see you they will talk to you and let you talk to them. When they allow that, half of the selling battle is won.

Most of us need cheering up, for business is hard and losses are frequent. The buyer is close to the troubles of his business. He carries the heavy weights of loss. The good-natured salesman brings to him a ray of sunshine, which he appreciates and for which he may reciprocate.

CONSERVATISM AND TAKING CHANCES

THE field of business is divided by a very high and a very strong fence. On one side are the conservatives, on the other the liberals and those popularly supposed to represent the more progressive element.

Just here may I not take an exception to applying progressiveness wholly to the liberal, for the conservative may not be unprogressive, although his enterprise does not appear to be so much in evidence?

Thoroughly conservative men, even those who represent the old-fashioned moss-backs, have achieved fame and fortune; and men of opposite tendencies, the most liberal in action, have made as great or greater successes. Both have their place in the economy and action of business, and the two classes will for many years continue to exist, to be eventually amalgamated.

But I think that the man of superlative success, who gets the most out of his opportunities, is a composite man, a liberal-conservative or a conservative-liberal, a man of both action and vision, always cautious, and yet not unwilling to consider the taking of reasonable chances whenever he can afford to experiment.

The element of risk exists in all business-doing. The man who will not move until the "surety-of-certainty" is guaranteed seldom moves at all. The stagnant pool

behaves itself. There is not a drop of liberalism in its muddiness, while the on-rushing river occasionally damages the property on either side of it; but it moves, and to its activity must be credited more profit than loss.

Just the right amount of conservatism, mixed with a similar volume of liberalism, accomplishes the completeness of result; but I doubt if this compound ever contained an equal amount of both, for I have never seen a business man who had not made mistakes.

The perfectly balanced man of business would never err in judgment. He could not fail except by outside pressure. If this individual lives, he has never come inside the horizon of my sight, and I do not know of any one who has seen him.

As none of us are perfect, and as all of us must err in judgment, and as there is always a risk in business-doing no matter how conservatively it may be maintained, we must recognize both the conservative and liberal methods of doing things, leaning for safety's sake towards conservatism when in doubt, and yet not afraid to take reasonable chances unless family or other responsibilities require us to be over-slow that we may be nearer-sure.

I very much doubt if any great success was ever made unaccompanied with some risk. But there is a marked difference between desperate risk, fool-hardy plunges, and the taking of legitimate chances.

No one should stake his all unless compelled to do

so. If he have both feet firmly planted upon the conservative road to accomplishment, he is justified in experimenting with both arms and hands. He may look into the sky if he will. He may be a man of vision as well as of action. He may try to see far into the future, even though he is not able to diagnose it with full exactness. The man without vision, who does not once in a while turn his eyes to the clouds and make pictures out of their curious formations, is too firmly planted on earth to move with the speed of success; while, on the other hand, the visionary man, who is unanchored somewhere, is without a traveled orbit and is like the mariner without a chart or a compass. He does not know where he is or where he is going to land.

Let us suppose, for example, that you are going to meet a certain customer. Perhaps you do not know him and have no time to find out his characteristics, and cannot, therefore, frame in advance any method of action. If you are too aggressive or too progressive, you may offend him. If, on the other hand, you are too conservative, you may not get close enough to him to consummate a sale. In this particular case the best you can do is to take reasonable chances, rather leaning towards conservatism than away from it. Here the activity of your mind comes into play, and the brain of the successful salesman is always alert. He is able to change from hot to cold, or *vice versa*, at a moment's notice. If he makes a mistake, he can usually correct it before

it is too late. He exercises caution at the start, branching from it as conditions permit or suggest.

Experience is the best teacher. I know of no other way of rightly mixing caution and its opposite. But do not be discouraged if your compound is not just right. Perfect conditions do not exist. You will learn from failure as well as from the success you make, and a few of the former may contribute mightily to your up-building.

Try to be as sure as you can be, always remembering that you can never be fully sure.

Your time is limited. You must learn to judge quickly, and sometimes instantaneously. Prepare for each case as much as possibility admits. Do not throw yourself at chance. But when you are rounded up at the crack of the business whip it is usually better to do something and say something than to do nothing and keep still.

Cling to the rock of conservatism, but do not become so much a part of it that you cannot trust yourself to leave it when conditions suggest a leave of absence. When you leave it, however, do not go so far away that you cannot get back to it.

RESPECT YOUR EMPLOYER

THERE is an unwritten law of business, from which there is no appeal, making your employer or manager your superior during the action of business. He is in command. You are under command. Without commanders the soldiers of business would degenerate into a mob, uncontrolled and doomed to death. So long as present business remains, the business army must be divided, the employer to be the officer in command, the employee to be subject to command.

There can be no discipline, no connected work, no successful endeavor, without the commander and the commanded, the one to direct, the other to follow. This condition exists in every department of work, from the street laborer to the manufacturer.

Because the employer is, for the time being, the superior of the employee, he has a right to expect and to demand, not only faithfulness, but respect on the part of the employee.

Few ever successfully commanded who have not successfully worked under command. Therefore, if you chafe in the harness, refuse to be guided by your driver, and to respect him while in the field of business, you are not likely to be fit to hold the reins of direction.

If you cannot give your employer some measure of respect and look up to him while at work, there is

something diametrically the matter with you or with him. If it is with you, get it out of your system at any cost, and learn to respect the man you work for just as long as you are with him. If the trouble is with him, get another position as soon as you can. Or go out into the streets and dig drains, or do some other kind of work which requires little but the exercise of brainless muscle.

You can never hope to succeed as an employee, or to maintain your position at the head of anything, unless you succeed in respecting your position so much that you cannot help respecting the man over you.

The chances are that he would not be above you in business, if he were not, for the time being, a better man than you are; and it is not likely that he will remain in command of you after you have demonstrated that you are a better man than he is.

Ninety-nine and nine-tenths per cent of the men who chafe under discipline, who have little respect for their managers, who are constantly back-biting and fault-finding, and who feel that they are superior to their environment and possess greater ability than do those above them, are unworthy of promotion and unfit to assume responsibility.

The world has produced few leaders fit to lead who have not been successfully led. It is unlikely that you can direct the efforts of others until you have learned how to direct by being directed, even if you have back of you all the universities in the land.

The man above you is probably there because he deserves to be. You are below him probably because you are not sufficiently disciplined and proficient to work beside him or above him.

Occasionally, the employee is more competent than the employer, but this condition occurs too seldom to be taken into consideration.

The position we occupy may be the one we are fit to fill, and we can never hope to rise from it until we have properly filled that position and have rendered to our superiors the respect and duty due them.

Lack of respect, even for those deserving little of it, if they be our managers, breeds dissatisfaction, and is one of the germs which stunt the growth of ambition; while proper respect, — and I mean business respect for those above us in business, — produces that right balance of mind and body which starts one on the right road to a successful future.

DOING WHAT YOU DO NOT HAVE TO DO

THE world of workers may be separated into a hundred, or two hundred, or, perhaps, several hundred classes of money-earners; but there are four distinct kinds of men and women, especially sales-people, viz.:

The first is filled with the lazy and indifferent, whether competent or incompetent, who go and come by the clock when they move at all, and who work neither for themselves nor for their employers. Some of them earn a living, most of them a very poor one, and the names of none of them appear in any roll of accomplishment.

The second group includes the technically faithful and honest, who move slowly and by rule, who have little ambition; but they do in a mechanical way what they are told to do. Most of them are able to earn a livelihood.

Under the third classification, I would place those who are conscientious, honorable, honest, faithful, and painstaking, who have some ambition, a desire to better themselves and to make full return for what they receive. To a large extent they do their best as they see it. They are on hand to receive orders and execute them to the best of their ability. They never reach the flush of success, but they are usually well-to-do and are seldom subject to adverse criticism.

The fourth class carries few members. Each representative of it is a marked man or woman who is at the top or close to it. The great captains of achievement belong to this grade. Their incomes, if they are salesmen or follow commercial pursuits, are larger, and often many times larger, than are others in their line. They are ambitious to the extreme, always faithful, and yet their superlative success is not due wholly to their honesty or to their faithfulness, although both of these qualities count mightily. They have reached their present positions because they did a vast deal of what they were not told to do, what they did not have to do, and what was not a regular part of their duty. They followed orders, and did more. They never lost an opportunity to do something which was not specified in the written or verbal order or request of their employers. They worked over hours, if the extra work would accomplish anything and was not likely to injure them. They became more familiar with the business and the goods they sold than they were required to be. They used their spare time in familiarizing themselves, not only with ordinary conditions, but with everything pertaining to the business inside and out of it. They were always ready to do more than told to do, and they looked for these opportunities and improved them. They made themselves a literal part of the business, far beyond ordinary requirements.

Every employer expects his salesmen to be faithful, honest, and painstaking, and to do as they are told to

do; but he does not and cannot demand more than this. It is optional with the salesman or employee. If he does what he is told to do, his work will be recognized and he will not remain at the bottom of the ladder; but there is no height to which he cannot attain if he of his own volition learns things and does things which never appear in orders.

The man who is strictly honest and faithful, and who follows rules and regulations, deserves promotion and is to be commended; and we should recognize him even though his virtues are negative and but a display of ordinary qualities, the sort of fellow who does nothing bad, and is never a candidate for a jail sentence. His goodness has kept him free from arrest, but it has accomplished little else.

The salesman who does only what he has to do is faithful, but commendable only in a passive way, and is entitled only to conventional praise; while the man who possesses all of these qualities, with the addition of constant and persistent activity, is sure to reap a reward which cannot be given to those who do only what they have to do or what they are told to do.

Superlative success-making depends upon doing what you are told to do and what you are not told to do, — what you must do and what you need not do. One without the other invites failure. Together they lead to the tip-top of accomplishment.

THE KNOCKER

COMPLETE satisfaction is self-idolatry. This world is no place for the thoroughly satisfied. Sensible dissatisfaction with self and surroundings is essential to the ripening of character and to the making of success, provided it is normal and does not exceed a reasonable quantity.

But there is a vast difference between too much satisfaction and debilitating dissatisfaction. The employee who is thoroughtly dissatisfied with his position and prospects without intelligent reason is not likely to reach more than ordinary achievement. He is doomed to present or to perpetual failure. He cannot have more than a slight grip upon his business, a hold which will be loosened at the slightest pressure.

I am not asking the employee, whether he be a salesman or not, to continuously remain in complete harmony with business conditions; or to always believe implicitly in the business policy of his house, or to feel that he could not in time be better situated, or that there is no one in the world as well off as he is; but I do wish to exclaim with all the emphasis of printed words that dissatisfaction is one of the pre-eminent elements of failure.

Perfection is impossible in business or out of it. Conditions are never wholly right. The ideal environ-

ment is seen by the man of vision, and he has never been able to materialize it. On either side is trouble, often real, sometimes imaginary. There is no straight road from anywhere to somewhere, nor is there any road-bed smooth and even or easy to travel upon.

Sensible and well-founded dissatisfaction may help one to rise, but general dissatisfaction either wounds or kills.

If you are dissatisfied with your present position more than in spots, or now and then, there is something the matter with you, or there is something the matter with your position, or there is something the matter with both. It is your duty to find out, and to make the discovery with all reasonable speed.

If you are to blame, get this feeling of dissatisfaction out of you at any cost. If you are not, either adapt yourself to conditions or get out. Do not remain in any atmosphere reeking with insurmountable difficulties. The brave soldier never stands upon sinking ground. It is more noble to run away than it is to attempt to stand firmly on nothing. But a large percentage of the dissatisfaction felt by the employee may be in his own imagination or is of much thinner quality than he thinks it is.

The majority of employees join the ranks of the "Knockers" when they enter business. They are surrounded by earlier "Knockers," — men who are dissatisfied, because they are not strong enough to be satisfied, and who build mountains out of the sand that they may stumble over their self-made handicaps.

These "Knockers" are always in evidence, — in the store, behind the counter, and on the road. They are busier finding fault than they are correcting faults. They labor harder than the faithful worker does, and actually become self-tired from doing nothing to remedy anything. They are the microbes of failure, greedy and vindictive, unwilling to injure themselves alone, but desirous of bringing every one else to their level.

Their work is indifferently done. Their ambition, if they ever had any, is reduced to the minimum. They come and go by clock, and would never be on time if they could help themselves.

They have no interest in anything, not even in themselves. They are not in favor of any kind of human betterment, any kind of progress, any kind of action, except the ability to kick, knock, and growl.

They would not be tolerated if their employers could get others; but, as they are so much in the majority, and as they can be made to do stereotyped work, they are hired on the market, stalled, fed, and driven.

Much of the unfairness, and even cruelty, practiced by employers would never have occurred if it had not been for the "Knocker," who cannot be considered as a man, because he resembles man in form only.

Some employers gradually become drivers rather than leaders of men. I am not excusing them. They should know better, and they are certainly intelligent enough to discriminate, but as I am addressing this

book to the employee, it is out of place for me to either praise or find fault with the other fellow.

A reasonable amount of self-satisfaction, and a general satisfaction with surroundings, are absolutely necessary for business success, and especially for the salesman.

If he cannot weather the breezes of the present, he will be wrecked by the storm of the future. He should throw his whole heart into his work, and he cannot do so if he is not satisfied with himself, with his employer, and with his business.

Don't be a "Knocker." Look for the good things rather than the bad ones, and the more you do, the more of them you will find, and the more of them you find, the more insignificant will the bad things appear to be and the less they will affect you.

Overcome dissatisfaction with satisfaction. The bed of business is not made of feathers. The "soft snaps" you hear about seldom materialize.

Business is business. If you are to be a part of it, be satisfied with it. If you cannot be satisfied, or reasonably so, get out; and, perhaps, you will not be quite so big a failure in something else; but the chances are that you have little in you of the stuff that success is made of.

The "Knocker" knocks himself, and his knocking is never heard inside of the door of accomplishment.

TELLING THE TRUTH

It is a fact that a proportion of salesmen misrepresent the goods they sell, intentionally or unintentionally, because they are required to do so or because they are laboring under the delusion that it is easier to make sales by so doing.

For the moment, let me disregard the moral side of truth-telling and give no consideration to the right or wrong of misrepresentation, that I may consider lying exclusively from the standpoint of business, for then I may commercially justify it if I can prove it pays financial profit.

Do not misunderstand me, and do not for a fraction of a second think that I would advise any one to lie or to misrepresent in business, even if by so doing he would double his profits, because money-getting is but a small part of human action, and the loss of self-respect and integrity can never be offset by any amount of financial gain.

The liar or the thief in business and out of it may at times profit by his rascality so far as financial return is concerned, but he is a pitiful, a miserable, and a contemptible fellow, respected by none, not even by the herd of hirelings who smile upon him and are but the hypocritical reflections of the money they get out of him.

But, because misrepresentation plays a part in the business of the world, and because there is undoubtedly reason to believe that lying will sometimes bring financial profit, I propose to discuss the truth and the lie without reference to the moral side of either of them.

Does it pay to misrepresent goods or to otherwise lie in business? Yes, sometimes, if you have no respect for yourself, if you have no conscience and sense of honor, if you do not expect to meet the customer again, if you are selling fake goods, if you are willing to sacrifice your customer after the first sale, getting out of him all you can and getting through with him then and there, and if you can cover up your misrepresentation, so whitewash your lie that its blackness will not be seen until the sale is consummated, then, and then only, lying becomes a business commodity with some financial value.

But if you are in business to stay, and consider the first sale as only initiative, the beginning of profit, the first sowing of the seed intended to grow an everlasting harvest, then the truth is absolutely necessary to profit and to the up-building of any kind of a business monument which is not likely to topple and fall when the winds of trade blow against it.

The stores which last, and remain permanent successes, are those which treat the customer honestly and fairly and look upon trade as a mutual exchange, the seller and the buyer each receiving an equal advantage.

The salesman should represent his goods as they

are, tacitly admitting that he is selling them at a profit, but at a price which will be satisfactory to the buyer. He does not pretend to be in business for the fun of it. He is there to make money. But, notwithstanding, he is in a position to benefit the buyer.

Enthusiasm is to be encouraged, that which comes from honest confidence in the goods, and, at times, it may border upon exaggeration; but this may not be always considered commercially dishonest. Certainly one has a right to be enthusiastic and to present the best side of the story. But if this exaggeration or enthusiasm is carried beyond reasonable bounds, and the best side of the goods is presented to cover up the bad side, the customer will sooner or later get at the truth of it and will not be "at home" the next time the salesman calls.

Successful salesmanship consists in not only selling the goods to the profit of the seller, but to the profit of the buyer. Both must be satisfied. Otherwise trade cannot be continuous.

Of course, there are concerns which continue in business and succeed by every form of sharp practice. They misrepresent continuously. Their salesmen are known as liars and their goods are unreliable. Occasionally they hold a customer for a while, but not often. Most of them fail, and some of them make money by so doing. They succeed by taking fearful risks. They are gamblers and cheats, and when they win they do so because they have struck the luck of

the charlatan. No matter how successful they may appear to be, or really are for the time being, back of their business is absolutely no good-will, no reputation, no asset beyond the cost of their goods.

There is a class of buyers, store-keepers and the like, who are willing to take chances, to play an unfair game of business, and there are many retail buyers who pride themselves on their sharpness. These people will occasionally trade at a questionable store. They like to play the game, but when it comes to buying something worth while they go to a reliable concern.

This class of trade has little permanent value. It runs at high pressure, is controlled by chance, whims, and the gambling instinct, and is subject to leaks and accidents.

I am aware that some sales-people connected with large establishments, and some of those on the road, are ordered to misrepresent their goods. They must do it or get out. If you are connected with one of these concerns, and have any respect for yourself, and desire to make a permanent success, it is your moral and business duty to resign at the first opportunity.

Connect yourself with a reliable house, if you would succeed. Unless you can inspire your customer with confidence in you and in your goods, you cannot continue to do business with him.

One permanent customer is worth many transient buyers.

One of the great fundamental elements of successful

salesmanship is the salesman's ability to inspire the buyer with confidence. This is impossible, except transiently, unless the salesman is honest with the buyer. Take confidence out of salesmanship and you have turned the business mart into a den of gamblers. Without confidence there can be no business except the barter of savagery.

No salesman ever succeeded who did not inspire confidence, and there is absolutely no way of creating it except by honesty and by always telling the truth.

I am not claiming that all business-doing is honest. I must admit that dishonesty and misrepresentation seem to have become a part of the great fabric of trade, but the dishonesty which has, or seems to have, a permanent commercial value is confined to methods, to policies, to unfair competition, and to illegal consolidation. And these very law-breaking concerns in their dishonesty of method demand strict honesty on the part of their salesmen, both to themselves and to their customers, and they refuse to misrepresent their goods, not because of conscience or of morality, but from business policy. They know that they cannot continue to do profitable business if their salesmen misrepresent or lie. They realize that they are more dependent upon the customer than is the customer dependent upon them. They, therefore, although permeated with dishonesty, are honest to their customers.

The business liar is sure to be discovered, and that being the case, lying is not a selling asset.

The truth-telling salesman, the confidence-inspirer, usually succeeds. The life of a lying salesman hangs by a thread, sure to break at the slightest strain.

If your present position prevents you from telling the truth, make a change. You can never succeed where you are unless you are willing to take gamblers' chances, to be satisfied with present profit, and to get along without a permanent name and reputation.

Honesty is the only safe business policy for those who would stay in business.

MODESTY IN SELLING

WHILE modesty is a prime and fundamental virtue, which is not likely to be over-cultivated or developed, by itself alone it has little intrinsic business value, and an over-abundance of it prevents success-making and is fatal to good salesmanship.

Those who pride themselves upon their modesty usually possess the least of it, for the self-gratification that accompanies modesty, if such a condition is possible, is the worst kind of modesty.

It is difficult to draw the line between self-respect and self-conceit. They naturally dove-tail, and we are not likely to have either in its pure state.

Because we do not know ourselves, we are unable to completely separate self-respect, with its accompanying modesty, from self-conceit; nor does there appear to be any particular need of producing this separation to the fineness of a chemical analysis.

Too much genuine self-respect is impossible. An over-abundance of self-conceit is not only objectionable, but disastrous.

I have never known any man of achievement, from the star-gazer to the grocer, who was not conceited, to an extent, at least. His command of self and his

strong mental poise, while not opposed to true modesty, carry with them sufficient self-respect to run over into self-conceit.

Commercially speaking, some self-conceit, well mixed with self-respect and flavored with modesty, is by no means an unbusinesslike asset; and it will be a part of business success, until we have become fully civilized.

The over-modest man does not succeed in selling goods. He who is afraid of himself as well as of others is doomed to failure.

True, the thoroughly conceited man is as badly off as is the man of over-flowing modesty, the difference between the two being that the former is an objectionable failure, while the latter is a harmless one.

Knowledge of any kind breeds self-respect. If it does not, it is not real knowledge; and those who really know things are not likely to be self-opinionated.

Modesty, then, may interfere with proper self-respect, by throwing knowledge out of balance, making it ineffective; while proper self-respect uses it as a building-block, or as a stepping-stone, or for some other part of the structure of achievement.

If you are abnormally modest, afraid of yourself, and have little respect for yourself or for your work, shun the selling side of business. Really, there is no place on the business earth for you; certainly none as a seller of goods.

Yet beware of self-conceit. If you have it, or mistrust that you have it, so mix it into the flour of

self-respect that it may be kneaded into acceptable bread.

Hold on to self-respect as you would to a life-preserver. It will buoy you up when it is calm, and hold you up in a storm. Without it, you can do nothing, certainly you cannot sell goods.

Do not despise modesty, but do not make a specialty of it while on the road or behind the counter.

You hear much talk, and most of it is but the sound of a rattle, about the pronounced and conspicuous modesty of great men, that they are retiring and really do not care to receive their deserts. These men simply appear to be what you may think they are, but down in their hearts is a definite self-respect, a reaching out for what belongs to them, without which they could not have become great or even half-prosperous. They may be over-modest in the things they do not care about, but they are like a solid wall when it comes to the things they love and practice.

The self-respect and proper confidence of the salesman extend to the goods he sells.

COURTESY AND POLITENESS

THE terms courtesy and politeness apparently more than really are synonymous. Politeness is somewhat shallow, and its quality may not be deeper than the surface. Courtesy, on the other hand, may be but a veneer, but it should be made of sterner and more substantial stuff. An action of courtesy may give one something, and be of material benefit, both to giver and receiver, while politeness may not be more substantial than a contribution to transient pleasure.

Some sales-managers consider courtesy as the greatest essential to successful salesmanship.

A friend of mine, who has profitably managed hundreds of salesmen, and who is recognized as one of the best sales-directors in the country, told me, without qualification, that he considered courtesy of more value in selling goods than even a knowledge of the goods and the ability to properly present them.

I am not prepared to agree with him to this extent. I think he is placing upon courtesy a burden greater than it can bear, but I do believe that no one can succeed in selling goods, be better than an ordinary salesman, who is not both courteous and polite, and who does not consider these attributes essential selling assets.

I present two concrete examples, both coming within my immediate experience:

Some time ago I made a trans-continental trip. The night before my arrival home, most of the men in one of the sleepers gathered in the smoking compartment, told stories and swapped experiences. A gentleman, with a strong face which showed determination well-balanced with great experience, acted as a sort of chairman.

My turn came, and, among other things, I gave the names of the railroads over which I had traveled.

Interrupting, the chairman asked me how I was impressed with the conduct of the A. & B. and B. & C. Railroads.

I told him that I proposed to be a sort of walking advertisement for the A. & B., to speak in the highest terms of its equipment, its management, and the territory through which it passed. But I added that its trains were over-crowded, some of the supply-cars failed to connect with the diners, and that I had difficulty in obtaining my meals regularly and sleeping accommodations.

"Then why do you speak so well of it?" the chairman asked.

"I will tell you why," I replied. "As a stranger, I called at the office of this railroad in a distant city, and made inquiries as to the best trains to take and the best places to stop over at, that I might not miss the best scenery. A middle-aged man, with a pleasant

face, not only greeted me as a friend, but he came from back of the counter and treated me as though I were a personage of considerable consequence. He brought another official to his assistance. With painstaking care he imparted information. His intentions were good, and he did his best to please me, but he made two or three errors, which affected my enjoyment. These mistakes were natural and excusable, but I pardoned him, not because his errors were excusable, but because of his friendly interest and his magnificent courtesy and politeness.

"There were annoyances all along the line on account of over-crowding; but I stood them, and made no complaint, because everybody, from the conductors to the brakemen, seemed to have singled me out for especial courtesy, while, as a matter of fact, the other passengers were treated as well as I was."

"How did you like the B. & C. Railroad?" inquired the chairman.

"It gave me the best accommodations," I replied. "The equipment was perfect, its trains were on time; in fact, I enjoyed luxuries equal to the best hotels. But," I added, "I would not go over that road again unless I had to."

"Why?" inquired the chairman in amazement.

"Because," I answered, "several of its officials were post-graduates of the College of Extreme Hoggishness. As a gentleman I entered their office that I might obtain information and sleeping-car accommodations. I

was treated with every discourtesy, even bordering upon insult. An inquiry showed that this lack of courtesy was almost universal."

Summing up, I claimed that courtesy was one of the business and railroad assets; that the traveler, or everybody else, would stand any unintentional annoyances if he received good wholesome courtesy; that he disliked doing business with a man who was technically all right, but who lacked good-heartedness and whose speech and manner were as automatic and as hollow as the tones of a cracked talking machine.

The chairman sat in silence for several minutes. Then, extending his hand, he took mine with a fervent grasp.

"My friend," he said, "you have expressed a great business-getting and business-holding truth. Courtesy, on the part of a railroad official, as well as upon that of all business-getters, is, I believe, vitally essential. Will you exchange cards with me?"

I handed him my card and received his in return. When I had glanced at it, he smiled and said:

"You did n't know that you had been talking with the general passenger agent of the discourteous road, but I believe that you told the truth, and I thank you for it. When I get back to my office, I shall stand in the middle of it and read the riot act, and there will be changes, and mighty quick ones, too."

In a certain city there are two vaudeville houses, one with a maximum charge of a dollar and the other of

fifty cents. The grade of performance is practically the same, and often the lower-priced house presents a better bill. The dollar-house has become an institution, and there is seldom a vacant seat in its auditorium. The fifty-cent house has changed hands several times, and frequently the actors play to fifty per cent of empty benches.

When you enter one of the houses you immediately begin to breathe and feel the atmosphere of politeness, good-will, and courtesy. Every one, from the ticket-seller to the ticket-taker, from the usher to the water-boy, treats you as though you were an honored guest. In the other house you are waited upon by automatons.

Here are two institutions practically alike, except that one carries a complete assortment of courtesy and the other presents its goods without trimmings.

The house of courtesy has made a fortune. The house without it has had a checkered career.

The foregoing examples apply to salesmanship as well as to the running of railroads and theaters.

Buying is serious business. It means an actual outlay on the part of the buyer. He must give up his money, and there may be a risk in the transaction. Therefore, it must be made as easy for him as possible, and everything which contributes in this direction facilitates a sale.

Perhaps it may be necessary for the salesman to assume politeness and courtesy, to exercise them when he does not feel them. This is not hypocrisy, and there

is neither business nor moral objection to it. If it be hypocrisy and morally wrong, then it is wicked to veneer the piano-case, or to varnish the outside of furniture, or to have the face of wall paper look better than the other side of it.

Courtesy and politeness may be called the sunshine of trade. Sunshine is much deeper than it appears to be. By touching the outside, it warms the inside also.

True, deep-felt courtesy and politeness may be impossible, unless they are reciprocated, and the buyer may not always reciprocate. He may be erratic and morose, even to the disagreeable point. In this case, the salesman may have to force himself to be courteous, but he should do it anyway. It is a part of his stock in trade. The buyer wants it, expects it, and demands it.

When it is difficult to be courteous, the salesman should school himself to it, that he may realize that the giving of it is a part and parcel of his business, as much as are other requirements. If he is not naturally courteous, he must learn to be.

Over-politeness and simpering courtesy are detrimental. Even the childish woman does not want to be gushed over, and any attempt to do it will result in failure. But clean-cut politeness and cordiality, properly regulated and well presented, are definite and positive assets, and they must be used if one would sell goods.

It is never difficult to give them if one is naturally genial and when they are appreciated or reciprocated;

but it is not easy to use them before a snarling, disagreeable, and unreasonable customer.

It is not easy to sell goods. It is not easy to do business. It is not easy to do anything worth doing. But so long as they remain a part of selling, they must be used, and used judiciously, if one would hope to rise above the ordinary.

If you are not naturally courteous, learn to be. Learn it as you would any other science of business.

Too many salesmen simply *wait* upon customers in an indifferent and negative way, antagonize them instead of pleasing them. This attitude, — this lack of courtesy, — drives the customers to another store or keeps them from making large purchases.

The courteous salesman is a marked man. He makes friends in the store and out of it, and this one thing alone lifts him above his fellows, and he will be promoted more rapidly than will a better salesman who is morose, indifferent, and who lacks the essential of business courtesy.

STICK-TO-IT-IVENESS

On the distant horizon of fading memory I think I see the old red school-house. As a matter of fact, this particular school-house was painted white and yellow with blue trimmings, but popular tradition says it was red, and red it shall be.

I see the typical old-fashioned school committee-man, who never wore a coat save on Sunday and school visitation days, when he took out his one boiled shirt with paper cuffs and collar, collated them, and after he had shined his shoes with a rag, started, cane in hand, for the one-room house of learning.

I recall many of these addresses. They were all alike, and seemed to have been written with the same pencil on the same sheet. They began in the usual way. Two great big pieces of advice always appeared: first, reference to our friend the rolling stone, the fellow who never seemed able to attach himself to any moss; and, secondly, he would say: "Boys, stick to yer jobs. Keep at it. Don't think of nothin' else, and jest work for all yer worth, and every one of yer may be Presidents."

Now I am not taking exceptions to this old-time advice, because upon that meat were fed the men of mark of to-day; and positiveness of statement, whether

it be fully right or altogether wrong, seems to count in the rounding-up of effectiveness.

Some folks have to be told what to do, and the teller of the past found it necessary to give little quarter. But nowadays we are supposed to think out our problems, and the fellow who cannot do it for himself goes to the wall and stays there. Facts are facts, even if they outrage popular tradition and bore holes in our favorite adages.

Let us return to our rolling stone. It is not true that every man of change is predestined to failure. There are thousands of instances of men of constant change, who have tackled many jobs and who are financial successes. Therefore, it is wrong to place the changeable man in a world of utter darkness, and to claim that he can never see the rising of the sun of success.

Yet it is nevertheless a fact that there is absolutely no evidence to prove that the rolling stone would not have been better off if he had given up his rolling and remained in one place and stuck to one kind of work.

It is also a fact that a large proportion of successful men have made comparatively few changes in their business life. They may not have remained with the same firm that they started in with, but they did not make a material change from the kind of business they began with. If their initial position was in a shoe store, they remained in the shoe business. If they took up engineering, they did not travel far away from mechanical headquarters. They chose, wisely or unwisely, the

kind of work they would do and stuck to it, subject to occasional change of base, but not often to change of vocation.

Probably half of us start wrong, that is, we do not choose the line we are best fitted for, largely because we make little effort to diagnose the business future. We take the first job which presents itself. If we are adapted to the business, we succeed; but if we are better fitted for some other line, our top notch of possible success is never reached.

Would I advise the man who has started wrong to make a change of business base, even after he had remained a long time in his chosen vocation?

Yes, if he is sure that he is on the wrong track and can afford to make the change.

Sometimes one cannot change from the wrong road into the right one. He is too old, carries too many responsibilities, and must remain where he is, accomplishing little, yet all the time knowing that he started on the wrong road and is still following it.

But if one has started wrong, and knows it, he should correct the mistake at the earliest opportunity, provided he can do so without undue sacrifice.

Upon general principles, where we are is the best place for us to be, unless we are sure it is not; and we cannot be sure that we are in the wrong place if the only evidence we have is our bigotry or unsupported opinion. If we are headed wrong, somebody besides ourselves knows it.

Stick-to-it-iveness is a great business asset. Without it the chances of making good are materially reduced. Practically all of the men of successful change made the moves they did with well thought out reason. They did not go from one thing to another until they had weighed each side and had an intelligent reason for making the change.

All of us do not have the same opportunity, and a change, or several changes, may be advisable for one man, while another has no excuse for not sticking to his job.

Mere dissatisfaction with your position should not be taken as good evidence, or exclusive evidence, in favor of leaving it.

Perhaps you are naturally dissatisfied and easily discouraged.

You know the outs of your present position, and know little about the disadvantages of the one you are seeking. The future, unknown to you, appears brighter, simply because you have not seen the dark side of it. Every position has its "outs," and some vocations have many of them. Unless you are sure that you are in the wrong place, and those who know you agree with you, you have no right to seriously consider making a change.

When in doubt, make no move at all. Stay where you are, and stick to your job, unless you and fair-minded friends can discover tangible and material reasons for advocating a change.

Let us suppose, for example, that you are connected with an old established concern, too conservative, perhaps, to suit you, a house which is doing business somewhat opposed to modern methods. You do not receive rapid promotion. You are dissatisfied. But, perhaps, you are a natural fault-finder, a knocker, and a kicker.

You know, or think you know, that another concern is more progressive and appears to offer better opportunity. Would I advise you to make a change? That depends upon circumstances. Would another house give you an equally good position? Would the newness of your work, and the change of environment, operate against you? Would you not be better off with the old conservative concern you are with if you exerted yourself to the utmost? If you enter this new and progressive house, will you not find yourself under the strain of greater competition? How will your ability compare with that of the hustlers and pushers you will have to compete with?

Upon general principles, stay where you are, and stay anyway, unless you are sure that a change is advisable or necessary. Thousands of successful business men began as office boys with the concerns which they are now commanding. They have business records to be proud of.

True, their experience may be more limited than that of the men who have been connected with several firms, but there is an advantage in remaining where you are

and of moving from the bottom to the top within the same environment. Opinions differ, and success has been meted out to both. But a change of business base without reason tends to failure. The longer one remains in a place, the better off he may be, provided he is offered good opportunity.

It is unsafe to follow the advice and action of the great generals of industry or of men of extraordinary mark. They are geniuses. They can succeed at anything and make money anywhere. Throw them into the sea of disaster, and they will float ashore and market the sea-weed that clings to their feet.

Until you become a great genius, it is safer for you not to wander very far from the middle of the road, and to study the experiences of men of ordinary success, and not to be guided by those of great exceptions.

The majority of successful men stuck to their jobs until they were forced out of them by unavoidable pressure, or had positive evidence that they were occupying positions of failure. But none of them changed on account of purely personal dissatisfaction. They either stayed where they were or moved for reason.

The majority of this majority never learned more than one kind of business, and they stuck to that business and mastered it.

Nothing sticks to the man who does not stick.

ORIGINALITY IN SELLING

I APPROACH this subject with fear and trembling, because, however much I may strive to make myself plain, it is possible, and, perhaps, probable, that I shall be misunderstood by some of my readers. If a misunderstanding occurs, it is likely to be confined to an assumed impression that I do not give originality and invention the positions they deserve in the business world.

Let me say, therefore, at the start, that I do not depreciate the quality and intrinsicality of good and sensible originality, for no man ever makes more than small success at anything, from selling goods to doctoring a patient, who does not do something somewhat different from others. The man without originality is merely an automaton, — a machine, — and the little success he makes is purely automatic. He resembles a human being only in outward appearance.

Things seem to move in cycles or in epochs. For a number of years conventionality held almost almighty sway, and most folks did as others did before them, looking aghast at the man who dared to travel beyond the edge of the road of convention.

Naturally, reaction set in, and man attempted to jump beyond the boundaries of caution and sense; and originality, or what masqueraded under that name,

became almost epidemic. It seemed as though every one was trying to be different from all others.

The simplicity of art twisted itself into the grotesque. Non-understandable books flooded the country. Advertising became yellow. Experts rose up as in a night and offered their services to business men, guaranteeing to do something different, this doing differently being paraded as their only asset.

Conditions are changing again, and we are getting back to simplicity, not to the conventionality of simplicity, but to real simplicity.

Yet over-originality and the erratic are still altogether too prevalent. In themselves they have little or no commercial or selling value. To be different from others may be to be inferior to others. An overstock of forced individuality, or of hot-house-grown personality, will operate against the salesman. So long as the world is partly clothed in conventional garments, it will refuse to accept surprising innovations with alacrity, and no man of business can travel with safety entirely outside the road of convention.

Our business assets are weighed in the scale of custom, and what we do, however good it may be, is of little value commercially unless it is recognized and acceptable to those we do business with.

The over-original salesman, scintillating with brightness, may not be as successful as one who combines conventionality with his originality, using enough of each to better impress the customer.

The smart salesman is seldom a good salesman, for smartness can contribute little more than transient result.

Buying is serious business, and any attempt at flippant originality, or originality above the comprehension of the customer, works against a sale.

Originality has a selling value only when it is appreciated by the buyer. If it is so bright that it dazzles him, so high up that he cannot reach it, it is not worth half as much as is well-balanced conventionality.

While originality should be cultivated, and while it has a great commercial value, it should be safeguarded with caution and distributed with judgment.

When in doubt, do not be original. Be matter of fact and exact always, and simple too. Display your originality as a sort of side affair, as additional sunshine, but do not shed it where it is not wanted, and be sure that it is wanted before you shed it.

Do not try to be smart. Do not attempt to be peculiar. Do not be radically different from others unless you are in perfect control of these attributes and know how to distribute them. There is safety in the middle of the road. There is danger at the sides, and there is chance for disaster beyond the boundary line.

The great salesman, like the great business man, wins by taking reasonable chances, but it is not safe for you to copy him in entirety. He has succeeded by the exercise of his enormous ability and remarkable personality. He is a genius. To him license is given.

Until you become truly great, you had better pat-

tern after those in the middle of the ranks, for they have followed accepted principles and have been reasonably sure of each step before their feet struck the ground. Study their methods and work alongside of them if you can. After you have learned the rudiments from them, you have a right to experiment, to bring your originality and personality to the front, to take chances, if need be; but be a good salesman along regular lines first and a shining star afterwards.

One great mistake made by young salesmen and others is to pattern themselves after some great genius, some man of remarkable mark. They would begin where he left off. Because he succeeded by doing certain things, they would do the same.

The experienced captain may sometimes steer without a chart, and he may diagnose the weather without a barometer, because he is both a chart and a barometer, and need not always go outside himself for direction; but the fellow underneath, however proficient he may think he is, had better consult the conventional chart and the automatic barometer.

No man ever reached greatness in salesmanship or anything else at a bound. He has no right to consider himself competent to act as a genius until he becomes one.

Respect fundamental principles, and do not entirely ignore conventional and acceptable rules and regulations until you have mastered them and know how to straddle a comet without falling off.

ADVISING THE CUSTOMER

Some advice is cheap, and much worse than none at all; and some people are so ignorant, arrogant, and self-opinionated that they lack the ability to discriminate and will not tolerate the semblance of a suggestion.

There are others who are afraid to take advice because they have played with advice-taking, and have lost.

These personal experiences have done much towards convincing some folks that advice is worth very little, and that the outsider cannot furnish profitable counsel.

But whatever may be said about it, and whatever one's personal experiences may have been, advice is a marketable commodity, and no sensible person will object to receiving suggestions from any one who is supposed to be familiar in the premises.

The retail salesman is supposed to know more about his goods, their styles and wearing qualities, than is the customer in front of him. He is in touch with the goods, sees more of them than is possible for the customer to see; and, if he is at all intelligent and even moderately interested in his business, he has information which no customer is likely to possess.

The traveling man may not know any more about his goods than does the buyer, because both are experienced,

yet the salesman sees his wares from a different viewpoint, and, as he is moving from place to place, he should know some things about selling conditions that the buyer may not be as familiar with.

The good traveling salesman is a sort of cyclopedia of his business. He cannot help gathering information, and what he has learned, or has come in contact with, may be of considerable value to the retail merchant or buyer.

The salesman is in a position to give advice, or he should be. If he does not know enough to intelligently advise the customer, he had better not attempt to sell goods.

The customer in front of the counter will gladly accept advice and suggestions from the salesman, if the salesman knows his business and the advice given is of interest to him, and if it is presented in a modest, gentlemanly, and courteous way. No customer worth having will resent good advice well given. In fact, most customers expect it, and some of them demand it.

The traveling man has, perhaps, a better opportunity, because he comes in contact with trade conditions all over his territory, and then he meets his customer in more of a social way; but the counter-man will find plenty of opportunity, if he makes an effort to get it.

Many successful salesmen have become the confidential advisers of their customers, who depend upon them, because experience has proven that the advice given is of value. The salesmen, who can give honest

and profitable advice and present it in a proper manner, will sell more goods and hold more customers than will he who attends strictly to selling and to nothing else.

All of us, including customers, are dependent upon others, need others' ideas, especially if they come from experience. The salesman has this experience, because he meets so many people. Therefore, he is logically in a position to advise and suggest. The better posted he is, the more valuable is his advice. If he knows his goods, and the use of them, he is in a position to be of great benefit to his customer.

The manner of giving advice is as important as the intrinsic value of the advice itself. Advice hurled at a customer, or given in an arbitrary way, irritates him and turns him against the salesman, and he will not accept it even though it be good. The salesman must study how to present advice and suggestions, so that they will be received in the spirit they are given. They will not be well received unless they are of benefit to the receiver.

Of course, the salesman's main object is to sell. The customer knows this, but this need not make the advice less valuable or less appreciated.

In giving advice, always tell the truth, for any discrepancy on your part will react against you and the firm you work for.

If the customer buys something wholly on account of the advice given him by the salesman, and loses money, the salesman is in a peculiar position, and

may have lost the customer. If, on the other hand, the advice has been profitable, the salesman has obtained a business friendship which will materially aid in holding and increasing his trade.

A proportion of retail buyers purchase through ignorance goods which will not be satisfactory to them. They do not know how to make selections. They do not realize that what pleases them at first sight may have no lasting quality. Although it is their own fault, they are likely to condemn the salesman who allowed them to purchase what they asked for, and not to think well of the store they traded with. They are disappointed, and they want to throw the blame upon somebody else.

The man behind the counter should not occupy an arbitrary position. He must not force the customer to go one way or the other, but if he knows the customer is making a mistake which is sure to result in dissatisfaction, he can, if he be a good salesman, present the case quietly and politely, and in such a way that the customer will really follow his advice and yet think that he is making the change of his own volition.

Many a buyer desires to purchase goods in too large a quantity, or goods which are not likely to sell. The salesman knows this, and he can make a larger sale if he says nothing. Generally, it pays to discuss the matter with the buyer, to frankly advise him not to purchase a certain line or to make his order larger or smaller, the reasons always to be given. This is friendly

advice as well as mighty good business. The customer appreciates it, particularly if experience proves to him that the salesman is right.

There is no reason why all trading should be cold-blooded business. A little, at least, of the better part of human nature may be given a chance to show itself. There is no reason why the average sale should not be a mutual affair, of equal benefit to both, nor is there any reason why good-will should not be a part of the negotiation.

But be careful. Do not give advice unless you are reasonably sure that it is good, and that it will benefit the receiver. Of course, you cannot be positive about this. If you wait to be absolutely sure, you may spend the rest of your life in waiting. Just be reasonably sure that you are right, then present it to your customer as you would to a friend as an act of good-will, and be so friendly about it and so cordial that it will be received in good part and appreciated.

Usually it is better to suggest, or to appear to do so, than to formally advise, for a suggestion is not likely to antagonize, while arbitrary or positive advice may not be always well received. Here is where experience comes in. If you have good judgment, you will soon learn how to do it. If you have not, you will have to remain an automatic salesman, — a sort of slot-machine, and nothing more.

BEING AFRAID OF YOURSELF

I HAVE attempted to bring out the selling value of confidence under the chapter heading of "Self-Confidence," but a few words about the opposites of it, — fear and abnormal reticence, — may not be out of place.

It is a self-evident fact that nobody ever succeeded in doing anything above the ordinary who was continuously afraid of himself, who always looked for failure, or who had not proper self-confidence.

It has been said that one of our greatest generals won his battles because he was always sure of victory and did not seem to know when he was beaten. But I do not feel like going so far as to unqualifyingly commend the man who does not know when he is down, for when one is certain that he is vanquished, real bravery justifies retreat. Only the fool kicks against the pricks that he cannot remove from his path.

But the man who is continuously afraid of himself, and is forever looking for failure, usually finds it. While, on the other hand, he who possesses proper bravery, and is continually looking for success, expecting to find it, may not always reach it, but he is more likely to.

Some people have a shrinking disposition. They are afraid of the dark, and tremble in the twilight. They cannot seem to hold themselves together, to protect

themselves against obstacles. They expose their vulnerable parts, and invite the thrust of the sword.

Some of this fear is pre-natal and natural and cannot be wholly overcome, but most of it is primarily due to pure and simple laziness, to an unwillingness to stand up, to fight hard and fair whenever occasion requires.

Let me give a word of caution to the man who thinks he is brave, and who may not be. The continuous display of independence is not bravery. Looking for trouble is the act of the fool, not of the man who is truly courageous. Bullying is really cowardice. To retreat, when all hope ahead is gone, takes a higher grade of courage than to stand like a rat in the corner and fight with no prospect of winning.

Truly brave men, in business and in every other walk of life, are those who are not afraid to meet opposition, competition, and obstacle, and who are strong in their self-respect; but who do not make a display of their bravery, and who consider retreat at the right time more honorable than the continuation of a strife which is sure to lead to defeat.

Fight when you must. Stand your ground when there is something to stand on. Run with all your speed when the enemy is solid against you and your firing line is broken to a man. Somewhere else you can set up a fortification, which may stand some chance of resistance. But do not make a specialty of running away. Put up and maintain a bold front when there is a fair fighting chance of victory.

There is no reason why you should be afraid of yourself. Remember that. Never forget it. What is there in yourself to be afraid of? Nor is there any reason why you should be afraid of your goods, if they are marketable. Nor is there any possible reason why you should be afraid of the customer. He is not dangerous. He cannot hurt you. You have a recognized right to address him. Exercise that right. Salesmanship is a part of business. Go in and win if you can. To be afraid is to lose.

YOUR COMPETITORS

NOTWITHSTANDING the tendency towards monopoly and the rapid growth of combinations, comparatively few selling houses are in exclusive command of any one commodity. Competition has not been stifled, except in spots, and few buyers are obliged to patronize any one house to the exclusion of others.

The natural trend of business has produced standard qualities, or, rather, many grades of standard qualities, and about everything is in duplicate. The salesman is likely to meet competition on every side, and generally his competitor is selling just as good goods and at the same terms.

There exists a selling policy, employed by some salesmen, of attacking the competitor at every opportunity and of strenuously depreciating the goods he carries. Practically all level-headed, far-seeing business men of judgment decry the practice of this policy and instruct their salesmen to leave the competitor severely alone, unless forced to express an opinion, and, even then, they favor speaking well of the competitor and of the goods he carries.

Nothing disgusts the average buyer more than knocking a competitor. It almost invariably shows weakness on the part of the salesman, and creates a suspicion that

the competitor and his goods are superior to the one who speaks against them and the goods he carries.

Running down the competitor is far more likely to do him good, and to advertise him, than it is the salesman who is so foolish and unbusiness-like as for a moment to imagine that talking against the competitor can have other than boomerangic effect.

Either speak well of your competitor and what he sells, or say nothing about him, except under very exceptional circumstances.

In selling goods it is better to be an affirmative man than one of negative character. Negatives have little selling value. Customers prefer to listen to positive statements, all right from the shoulder of truth, and the more affirmative they are the better they like them. Talking against the "other fellow" is of negative quality, and for that alone it is out of place in selling, to say nothing about the bad policy of talking against anybody in business.

Mind your own business, and let the other man attend to his business, is a mighty good selling policy.

IRRITABILITY IN SELLING

THE perfectly balanced, equipoised, always calm, and deliberate individual does not exist, never has lived, and never will, until the inauguration of Utopian days.

Extravagant living and strenuous business-doing, coupled with frequent family troubles and friction, make it impossible for any one to be other than irritable at times, and few of us, probably none of us, can always completely control it, and every one will show it now and then, if not more frequently.

It is both useless and absurd to demand perpetual calmness of any one, or to advise him to keep his irritability completely within himself. Imperfect human nature and conditions are opposed to anything like a perfect state.

It has been said that the strongest personalities, the brains of superlative quality, carry the greater volume of irritability; and that ordinary people, traveling conventional paths, show a more equitable balance. It does not matter whether this be true or not. Certainly, it should not be cultivated as an evidence of genius.

The great man, with shabby coat and frayed trousers and with long and unkempt hair, may accomplish much in spite of his untidiness; but his personal carelessness is not a part of his work. It handicaps, not

aids, his progress. The irritable genius may succeed, because he may have sufficient power to override his misfortune.

Because the greater part of irritability has its source in the immaterial or in the imagination, it can be largely overcome or regulated to a considerable extent, unless one is suffering from chronic neurasthenia. The life of the salesman is one of constant friction. The customer is often unreasonable and irritable. Because he is the buyer, he may claim the right to do and act as he pleases. He may cast his spleen or irritability upon the salesman, unloading it upon those he comes in contact with, and especially upon those who make a request of him.

It is useless for the salesman to criticise the customer, to question whether or not he has a right to be irritable, so long as the buyer will do what he wants to and will not allow any one to dictate his policy.

So long as selling requires the exercise of a request, and so long as the seller is usually more anxious to sell than is the buyer to buy, the salesman will be obliged to cheerfully put up with irritability upon the part of the customer, whenever he can do so without loss of self-respect.

It is possible for the irritable buyer, even in his unhappiest moods, to profitably buy for his house; but it is utterly impossible for the irritable salesman to present goods and irritability at the same time and sell the former.

So long as you are a salesman, you will have daily opportunity to be irritable, and perhaps you will meet with hourly disappointment. Every time you fail to make a sale you are temporarily disappointed, perhaps disconcerted, and disappointment breeds irritability, and this irritability, if sustained or shown, cannot do other than interfere with your selling effectiveness.

The retail salesman is especially subject to irritation, for the consuming customer, the one who buys at the store, is not likely to know goods and their values, or just what he wants or must have; while the buyer of goods to be sold again is a better judge of qualities. He meets, therefore, more unreasonableness, and the display of a greater lack of business principles, than come into the every-day work of the wholesale seller. This unreasonableness, and often unfairness, will continue, and there appears to be no way to get rid of it. But if one accepts conditions as does the mariner, who is always prepared for a storm, he will not be so much affected.

Whatever may be the degree of your irritability, and however difficult or easy it may be to irritate you, you must control or regulate it while you are before your customer, or you will miserably fail as a salesman.

In the act of selling it is absolutely necessary for you to show good nature and courtesy, no matter what your inside feelings may be. If you cannot control your irritability for a time, keep away from your customer, if it is possible for you to do so, and do not go

back to him until you are in control of yourself. You may have a thousand excuses for being morose and discouraged, and all of them may be good, but as the customer is not interested in your personal welfare, you have no right to expect his sympathy or regard, unless he is a personal friend. You present yourself to him with a request that he buy something of you. You take the initiative, not he. He is not on sale, you are. As you want his money more than he wants to give it to you, he is your superior for the time being. Therefore you must meet him in a way that is satisfactory to him.

I have the deepest sympathy for men in trouble, for men with physical or other ailments, which keep them constantly on edge. They are indeed worthy of all compassion. But business is often cruel. Little of the human heart comes into it. It is a hard game to play. Its action does not seem to give much room for the nicer things of life. It is give and take, and take and give.

All of us, both buyers and sellers, are subjected to the influences of every kind of environment. It would seem that expert buyers, men who do nothing else, would buy with their brains without the intervention of their feelings, and that it would make very little difference whether the sun shone or it rained. As a matter of fact, from ten to fifty per cent more goods are sold on a pleasant day than are sold when the skies are dark.

I am not referring to the retail business, because folks naturally stay in when it rains, but to the purchases made by professional buyers. Thousands of expert salesmen never call upon the buyer when the weather is unpleasant, unless conditions are urgent.

Greater and better sales are made under favorable environment, and the salesman is one of the creators of it. It is as necessary that he be sunny as it is that the day be bright.

If goods cannot be rapidly sold on a stormy day, how can the salesman expect to succeed with a cloudy face and an irritable manner?

Be considerate of the customer. He may be in a more difficult position than you are. At times he is puzzled and uncertain. If you put yourself in his place, perhaps you would show more irritability and indecision.

Irritability felt interferes with good salesmanship; irritability shown is fatal to good salesmanship.

PERSONAL HABITS

PERHAPS you have a legal right to do as you please, provided you do not interfere with anybody else; but I do not see how you can do as you please, if what you please to do is wrong, without affecting somebody besides yourself. Therefore, if you are dissipated, or have bad habits, you have no legal right, or any other right, to do as you please, or as you have been doing, for you are outraging the best of public sentiment and are antagonizing accepted business principles.

I am aware that some forms of dissipation do not seem to interfere with business-doing, for some men of bad habits make money, and some drunkards keep their financial heads above water. But dissipation contributes to failure, and usually gets the better of the man who practices it.

As a salesman, you are under three definite laws: the law of right, the law of your own self-respect, and the law which says you shall be faithful to the man you work for and do nothing to discredit him.

The first is the most important of all, for from it spring all other laws and rules. It is the law of principle, and principle is the highest of all.

The law of your own self-respect is not of minor importance. The drunkard cannot have it. The man

of bad habits, although the practice of them may bring him transient pleasure, never respects himself, and this lack of self-respect permeates his entire system and puts a brake upon his progress.

To sustain bad habits, when you are in the employ of another, if these acts interfere with your effectiveness or with his, is as dishonest as it is to steal money. You are misrepresenting your employer and are a disgrace to the trade you are in. You cannot honorably accept your salary, even if you are able to sell goods successfully. You are a personal and business disgrace, a consummate fool, a sort of perpetual suicide, wronging yourself and everybody you come in contact with.

Your personal habits are a part of your business structure. From a business point of view alone, leaving the moral side of it out altogether, you have no right to have any habits which will interfere with your business progress, and no form of dissipation can possibly be to your benefit, and it is absolutely sure to work to your detriment.

Bad habits of every kind undermine health, destroy self-respect, and handicap effectiveness.

Wholesome diversion does not require any form of dissipation for its realization. The men who enjoy themselves to the uttermost, and who are best fitted to fight the business battles, are those who are ever careful of body and mind and who refuse to have anything to do with anything which interferes with business or social progress or with the pulling down of character.

The good fellow, who is respected, and who sells the most goods, does not do it with the aid of any form of dissipation. The dissipated man is not respected even by those who share his illegitimate liberality. Even bad men respect and honor the salesman of sterling character. They are distrustful of the fellow who does not retain his self-respect. A drink never consummated a sale that would not have resulted without it. You never offend a man by not asking him to share your dissipation.

Good personal habits are business assets and contribute largely to selling success. With bad habits you may succeed to some extent, but the flush of success is never yours.

TAKING AN INTEREST IN YOUR WORK

It is a positive fact, admitting of no qualification whatsoever, that no high grade of achievement is possible unless one takes an active, a thorough, and a strenuous interest in his work.

There is little fun, and practically nothing worth while, in playing, unless one goes at it with his whole heart, with a definite object, and with the determination to have a mighty good time.

Indifference, either in play or in duty-doing, is the microbe that eats the life out of everything it comes in contact with. No matter how menial our work may be, how disagreeable or how discouraging, we accomplish little in the present, and practically nothing in the future, unless we give it undivided interest for the time being, at least.

Perhaps a small amount of merely mechanical work, assuming that there is anything solely mechanical, can be done with indifference; but even this work of pure detail lacks finish unless interest is back of the hand which does it.

The most successful men, whether sellers of goods or not, began at the bottom, and they were as much interested at the start as they were at the finish. Whatever they did, they did with their might. The boy who

does not take an absorbing interest in the mailing of letters or the sticking on of postage stamps, or makes drudgery of it, or does not consider it a means to a better end, will probably never succeed, and surely will make nothing of himself if his attitude towards his work does not undergo a change.

Everything worth doing is worth doing with a will, and is, for the time being, a vital part of life, and there is nothing of consequence which should not carry interest in the doing of it.

If you do not like your work, either learn to like it or get something else to do; but make every effort to like it before you give it up. It must not be considered drudgery, no matter how disagreeable it may be to you. Even the least of things are stepping-stones to better things.

Few of us are doing exactly what we want to do. There are objections and obstacles all along the line of every kind of endeavor, and we may like one thing better than another, yet be obliged to do that which we like to do the least. But for all that, we can bring ourselves to be interested in the most menial labor, and to throw our heart and energy into the acts, which, for the time being, are parts of our work and lead on to better things. We can often learn to like what we have disliked by forcing ourselves to take an interest in it.

No salesman ever amounted to anything who did not have and maintain a decided interest in his work,

who was not interested in the goods he sold, and who did not feel a personal interest in the house he worked for.

Undoubtedly it is difficult at times to respect one's employer, and the methods of some particular house may not appeal to the employee; but, so long as he retains that position, he must give to it the best there is in him and look forward to a change for the better.

Remember that where you are is likely to be the best place for you, and you should feel that way unless you have positive reasons for not doing so. Particularly should you be interested in the house you work for, and feel as though you were a member of the firm, that you are a part of a mutual interest. Unless you maintain this attitude, you will be of little use to yourself or to your employer. Your interests should be interlocked, unless there is something the matter with you or with him.

Be sure that you are right before you criticise the man you work for. The fact that he is in command of the business may be considered as evidence that he is your superior for the time being. At any rate, you are commercially his inferior, and you never will be his superior unless you respect yourself sufficiently to respect your work.

Before deciding that your house offers you little or no opportunity, go into executive session with yourself, analyze yourself, watch yourself, and make sure that the bulk of the trouble is not in you. You are really

working for yourself, and you should be right, whatever may be the condition of the house you are with; and you cannot be right if you are not doing your best with heart and hand, even under real or imaginary handicaps.

If you are positive that the firm is to blame, — and do not allow your unsupported opinion to have weight, — get out. But be sure of your ground before you make the move.

Be interested, not only in the firm you work for, but in your associates. Get in contact with them. Learn of them, and give something in return. Do not place yourself upon a level above others unless you are sure that you are superior to them. If you are, it may be better to keep it to yourself so far as talking it or showing it is concerned.

Without this broad interest in your work, you will be a rattler of business, a disturbing element which only makes a noise.

If you cannot obtain this interest, if you continue to be dissatisfied, and are unable to locate the trouble after the most strenuous effort, salesmanship is undoubtedly not in your line, and I would advise you to go on the farm if I thought you would make a success of farming. You are on a side track that runs into a bumper or a sand bank. You are not getting anywhere. Get back on to the main line of interest.

TREATING THE CUSTOMER

Some folks, outside of the selling craft, seem to be laboring under the delusion that universal treating on the part of the salesman is necessary to success on the road.

Although the doing of courtesy, with more or less of what is known as treating, is quite common, it is not practiced by every salesman, nor is it done continuously by those who employ it. Some very proficient men stick strictly to the yea-yea and nay-nay of business-doing, and neither give nor receive a favor.

Yet there is not, and cannot be, any moral or business objection to so-called treating, if it be in the form of a courtesy or a return favor.

Life is hard enough, anyway, and business life too strenuous to forbid the introduction of small courtesies and the exchange of little things which smooth the business way and which add much to commercial as well as to general good-fellowship.

But treating should never suggest bribery. If it does, it is fatal to continuous success. So long as it remains a courtesy, an act of good-will, it has commercial value.

But the salesman should never treat the customer, even to a cigar, at the first interview. Let him come to business and stay at business. But after the prelim-

inary skirmish there is no objection to his handing the customer a cigar, or offering to do a minor favor, if he is reasonably sure that it will be considered as a simple act of business good-will, and will not be taken as a bribe.

Let us suppose, for example, that a salesman enters a place of business for the first time. He does not know the buyer. Nothing creates a worse impression than to immediately offer something like a cigar, which at the time is little else than a bribe; nor should he invite the buyer to dine with him until he is sufficiently acquainted with him to establish a sort of business friendship.

If the salesman is a baseball enthusiast, and he knows that the buyer is a fan, or if he enjoys any other sport or form of diversion, and thinks that the buyer is like-minded, then he may in perfect good taste invite the buyer to accompany him. He may take him to lunch or to the theater. He may even send him a box of cigars, if the buyer expresses satisfaction with the flavor of the one he handed him; but never at or near the initial interview.

The safest rule to follow is to do no treating until you know the buyer, and then to treat him as he would treat you, a sort of exchange of courtesy, it making little difference which one stands the expense.

But the offering of any courtesy which is forced, or appears to be, or is obviously done to buy the good-will of the buyer, is mighty poor business.

Of course, if one chooses to minutely analyze the fundamental elements of courtesy or of treating, he may discover that most of it is done in hope of a reward, and is, therefore, pure selfishness, and not a part of the better part of business-doing.

What if it is tainted with selfishness? What if it is a means to an end? If it accomplishes a result without injuring anybody, and, at the same time, makes trading pleasanter and easier to do, and helps to create and maintain business friendships which lead on to better sales, it should not be discarded.

No iron-clad rule can be laid down. No first-class buyer can be bribed, but the buying hours can be made pleasanter to him.

Simply treat him as you would a friend, and as a friend would treat you. To do more than that is bribery, to do less than that may be business foolishness.

INDEPENDENCE IN SELLING

THE salesman with independence written all over his face and a chip on each shoulder is looking for trouble and is going to find it. So long as he maintains this attitude, he will remain far away from the boundary lines of success.

Nowadays, many of us think altogether too much about our independence, and the folks who have the least right to it appear to show the most of it.

This desire to be independent has become almost epidemic, a sort of international disease, deathly if chronic, and injurious if of a transient duration. Some of us forget that proper self-respect recognizes others as much as ourselves and that real civilized independence is as dependent as it is independent.

Individual man amounts to mighty little. As a part of a composite whole he is of almighty importance; but take him individually, by himself alone, he is no more than the smallest bubble on the biggest sea.

The more ignorant and arrogant the man, the more he talks about his independence and the more he demands what he refuses to give. He establishes his own methods and frames a self-made code of principles. He will do it his way or not at all. He considers himself a great universal IT. If any one opposes him, or acts

differently than he does, he either condemns him or pities him. He does not realize that pure independence grows out of dependence.

I believe in self-respect. The man without it is a little bit worse than nothing. But the man who prides himself on his independence, who proposes to sell goods his way without thinking of the customer's way, who believes that he is right and the customer wrong, who is opposed to the policy of the house he works for when it is an honest one, is unfit to meet any part of the business world, and, when he does meet it, he is beaten at every point. This sort of independence is false independence, not the genuine article, and the exercise of it is absolutely fatal to any kind of success in salesmanship.

The customer has as much or more rights than those possessed by the salesman. The salesman is asking the customer to buy something, and he is more anxious to consummate the trade than is the customer. The asking-man is always dependent upon the man addressed. This position does not mean a loss of self-respect, or anything which interferes with positiveness or with the maintenance of a good honest policy. But the independence which is purely personal, and which is founded only upon the person himself, is one of the greatest obstacles to business-doing.

The majority of poor salesmen object to the policy of the house they work for, object to discipline, object to being told anything, and are particularly opposed to being ordered. They feel that they are looked upon

as dependents, and in this they are right, because they are; but the trouble is that they do not accept this condition as they should, and they chafe under the necessary, and often kindly, harness.

While many a business house is weak in method and wrong in policy, the chances are that it is better conducted than it would be if it was managed by its employees.

Practically every manager of salesmen or maker of selling policy has sold goods on the road and in the store. He is not a novice or tender-foot. He is probably a past-master in salesmanship. He gained his present position because he had drilled in the ranks. His promotion was not that of accident. He has been placed at the head of the salesmen, because he deserves to occupy that position. Not only is he familiar with salesmanship, but he is a part of the policy of the business. The salesmen under him should look up to him, should believe in him and support him and his policies, except in exceptional cases.

Upon general principles, the man at the head deserves to be there or he would not be there, and upon the same general principles it may be said that the salesman under the sales-manager is not as proficient in policy-making and in management as is the man over him, although he may grow to be superior to his commander.

The best salesmen are those who do not chafe under discipline, who do not retaliate at the unreasonableness of the customer, who realize both their dependence and

their independence, and who recognize the rights of others, so long as the exercise of them does not insult their self-respect.

They are both dependent and independent, — dependent upon others, that they may learn of others and satisfy others, and independent so far as it is necessary to be for the exercise of their self-respect and well-earned judgment. They realize that their strength is not in their own individuality wholly, but in their ability to learn of others and to shape their lives, so that instead of being mere individuals, they represent in a composite way the best obtainable.

The independent man does not live.

Many of us are impressed with the majesty and dignity of the commander on the bridge. His face shows the wear and tear of sea, wind, and experience; his tread is positive; his words few and to the point. It is popularly supposed that he is in absolute command of the ship, not only of the vessel itself, but of the lives of all on board. He represents the superlative of independence and individual command. As a matter of fact, he is the best example of the composite. He reached his position step by step. As he stands upon the bridge, the personification of dignity, he is one of our best monuments of the dependence of independence. No man has worked harder to learn what others know, no man has experimented more than he has, no man is more willing to listen to the whispers of the wind and to let the gentle breeze warn him of the coming

storm. His eyes are seldom off the barometer or compass. He is a product of composite training, the representative of true independence.

Do not be afraid of not receiving the respect due you. Better find out whether or not you deserve any respect. If you are worth it, you are likely to get it some time.

Do not be jealous of yourself. You are having no worse a time, probably, than the experience of the thousands who are with you and above you. Our lives are much alike, so far as business goes. We have to go through a certain amount of training and stumble and fall a number of times. All this is discouraging, and we are prone to envy the fellow ahead, and to pull at the reins, forgetting that the driver may have had a harder time than we are having while between the shafts of labor.

SELF-CONFIDENCE IN SELLING

BETTER have too much self-confidence than too little of it. I say this advisedly and emphatically with a full appreciation of the injury which usually results from over-confidence and arrogance.

The man of extreme modesty, the reticent man, the man who approaches the customer in a cringing sort of way, will never consummate a sale worth while.

I despise arrogance; I have little respect for over-confidence; the conceited man is an abomination; and personally I have some admiration for the man of extreme modesty, particularly in these days when modesty has not become chronically prevalent.

To sell goods is an art by itself, and aggressive work is necessary. The salesman must take the initiative. In the battle he must fire the first shot; and, if his first shot misses fire, he is likely to suffer defeat.

Now confidence, even too much of it, seems to be a part of the battle of life, particularly that of business, and more particularly that of selling.

The customer, for the most part, makes it a point to assure the seller that he does not want to buy. He produces real or imaginary obstacles. He is, or pretends to be, opposed to buying. He is looking for a weak place in the salesman, and proposes to take

advantage of it if he finds it. Therefore, the salesman with little self-confidence is likely to fail.

Of course, the perfect salesman, if there be one, carries with him the right amount of self-confidence and modesty. But the perfect salesman does not exist, and, if he did, he would have a hard time fighting the imperfect customer.

The appearance of arrogance is fatal, and too much over-confidence results in failure; but a reasonable amount of self-confidence, even a little too much of it, is a part of successful salesmanship.

No one can sell goods if he approaches the customer with apparent discouragement written upon his face. The appearance of failure breeds failure.

Nobody likes to buy of any one who does not expect to sell. The salesman who thinks he is going to make a sale, or who acts as though he appeared to expect to sell the goods, who has confidence written on his face, stands double the chance of selling as compared with the man who meets his customer as though he were afraid of him, and who talks his goods as though he were sure he could not sell them.

The question naturally arises, how can I, as a salesman or a would-be salesman, obtain and carry self-confidence?

The best way to get it or to develop it is to be enthusiastic about your work, to respect the quality of your goods and the house you work for, and to honestly believe that what you have to offer actually benefits

the buyer. You should be proud of your work, proud of everything connected with it, and consider discouragement as a part of the discipline of business.

If you thoroughly respect your goods and your employer, if you are proud of your position, and if you feel that you have what the customer wants or ought to want, you will carry with you a certain amount of self-confidence; in fact, it will be well nigh impossible for you not to have it.

If you cannot cultivate this self-confidence, if you are going to remain afraid of the customer, if you cannot bring yourself to respect your work, and if you are always thinking of the discouraging side of it, I would advise you to give up trying to sell goods and obtain some other position if you can, preferably in some clerical line where what you do means a good deal more than the way you do it, — a position which does not bring you in contact with the active side of business.

Remember that in selling goods, and, in fact, in doing anything else, you are reckoned by what you are. If you have confidence in yourself and in your work, you show it and the customer sees it and feels it. If you have not, instinctively you are looked upon as a weakling, and the best of goods and intentions count for little.

The salesman is like the soldier on the firing line. If he cannot stand up under fire, he should not be allowed to handle a gun.

Thousands of men and women, competent to do good work in clerical or other lines, have been induced to become sellers of goods, and they make little or no success at it, although most of them manage to scrape together a living. They lack the essentials of salesmanship and particularly self-confidence. They are afraid of their customers, and they cannot seem to rid themselves of this fear. They should make the most heroic effort, and, if it fails, the quicker they get out of the selling ranks the better off they will be, for there is no opportunity for them beyond that of the lowest. If they cannot stand bravely in front of the customer and meet discouragement and rebuff with a smiling face, secure in the confidence of their ability to make a sale at one time or another, if the sale be possible, they have no right to pretend to practice salesmanship. Their place is elsewhere.

STUDYING OTHERS' METHODS

OUTSIDE of the practice of the concrete arts and clerical work, individuality plays an important part. In fact, without the exercise of personality, and doing things one's own way to some extent, more than ordinary achievement appears to be impossible.

This exercise of individuality is much in evidence in salesmanship. While there are fundamental principles of selling, which cannot be done away with impunity, the majority of successful salesmen, and even those hardly above the mediocre class, have some method of their own, approach people in a little different way than others do, and present arguments which represent self-thought-out ideas, even to a small degree.

I have already said, and most emphatically, that salesmanship cannot be taught as can bookkeeping, or chemistry, or mathematics, or other concrete arts or sciences, as it is not, and probably never will be, an exact art, teachable by textbook or arbitrary rule.

Nevertheless, salesmanship is not above instruction, but this teaching, if I may call it that, should come by suggestion, the studying of men and things, and by the exchange of experiences.

Even great ability can be developed into greater ability. The best of us can become better, know more, and achieve more.

Experience and contact with others are the best teachers of salesmanship. Much of salesmanship which may be learned comes from this experience and contact with others, and this is accomplished by studying others' methods and by using as much of them as one can profitably handle.

The practice of untrained personality, and the exclusive use of original methods, invite failure. Notwithstanding how great our personality may be, alone we are very imperfect, and by ourselves it is impossible for us to accomplish anything worth while.

Although we have methods of our own, or what appear to be, and although many of us possess strong personality, as a matter of fact, these methods and our personality came largely through others, or, rather, contact with others developed them. While large differences are noticeable, all of us have something in common, and most of our ideas are adopted.

Successful salesmen live and travel with salesmen, are active members of organizations of salesmen. They never lose an opportunity to discuss with others the experiences of selling. To the little they know they add the much that others know. They are students of the human nature of salesmanship. They are able to gather something from every one. Even the office boy can give them points.

They know how to adapt the methods of others to their own use. They absorb, and yet distribute at the same time. They take and they give.

Notwithstanding that there are many different methods of selling, they are not necessarily opposed to each other, and the hearing of any kind of experience, whether it be usable or not, adds materially to working knowledge.

Salesmen should get together, play profitable games of conversation, exchange experiences, even minor ones, talk about everything which pertains to selling.

In no other way can one become a successful salesman, for in no other way can he get beyond himself and use experiences and methods which have been proven to be profitable.

The competent salesman knows what he can use, and what he cannot use, to advantage. He knows about how much he can take from another, and what is worthless to him.

Never lose an opportunity to talk with salesmen. Go out of your way to meet them. Arrange to spend some evenings together. While on the train, congregate. Be friendly. If you are able to absorb, you are fit to distribute, and it will be an even exchange.

If you are behind the counter, watch the other salesmen. See how they do things. Whenever possible, visit other stores and study the methods prevailing.

One reason why the average traveling salesman is

more progressive than is the man behind the counter is because he comes more in contact with his craft, and has, perhaps, a better opportunity to exchange experiences and ideas.

But the inside salesman can do all this if he will. He can easily study the methods of the salesmen close by and those across the aisle. He has opportunity to visit other stores and to watch the salesmen there. He can meet salesmen in the evening. I would advise him to form an association of his kind, if there is not a good one near by, to hold weekly or monthly meetings, these gatherings to be open forums, with or without a light lunch. Something to eat, however, helps mightily. Much of what goes into the stomach comes out through the mind, and eating together brings people closer together.

Arrange to meet salesmen at your noon-day lunch — not all of the time, because too much of it is not good for you and you need outside association.

Do not be afraid to ask questions. Refusal to do so is not modesty or consideration for others, but *prima facie* evidence of your laziness and indifference. The man does not live who does not like to be questioned along his line. In this direction he is more willing to give than he is to receive. When we know a thing, we like to tell others about it. If you want to know anything, and you know of some one who has it, go and get it. He is standing on the front steps beckoning you to him. It is a good thing for

him to tell what he knows, and a good thing for you to hear him tell it.

Get together socially and in a business way. No matter how expert you are, you do not know it all. Only by experience and contact with other salesmen can you rise from the ranks. Then, this game of conversation, this swapping of experiences, is not hard work. It is really diversion. It is interesting, or should be made to be. You rest while you talk and listen.

The secretive person and the hermit have no right to live in the world of selling. Really, there is not any place on earth for them.

Get together, and keep getting together. Study others, and let others study you. Learn, not only how to understand others' methods, but how to adapt them to yourself; and, what is as important, learn by experience and by a study of yourself how to discriminate between the good methods of others which you can use and the equally good methods of others which, for some reason, you can never successfully practice.

As a rule, do not try to do as others do just as others do it. The very difference between us makes it impossible for any two of us to be exactly alike or to do the same thing exactly the same way. Men of success are composite. They use what they have and what they can honestly get from others. They are not dishonest, because they give as much as they take, and what they take from others is not anybody's loss.

They simply become a part of the great world of experience, taking and giving as they go along, never relying wholly upon themselves, but realizing that success in every direction depends upon interchange and reciprocity.

INDIVIDUALITY IN SELLING

THERE are several reasons why you should preserve your own and exclusive individuality, especially in salesmanship. The prime one is that you have not, and cannot have, any other individuality.

No two men were born alike. If this unprecedented accident should occur, they would not remain alike, for no two of us have duplicate experiences or can possibly live under exactly the same environment.

Nature does not permit duplication in minute exactness of anything either on the earth or under the earth. There are no two thumb marks alike among the billions of inhabitants of the world.

Because the individuality of each person must remain, and is subject to no fundamental change, and because we cannot possibly possess any except our own, it is obviously both foolish and unbusiness-like to attempt to be what we are not. To do so invites failure and results in discouragement and loss.

True, we may overcome many of our bad habits, regulate or get rid of our irritating mannerisms, train the harsh voice to resemble softness, appear to be pleasant when we feel the opposite, and curb or regulate a bad disposition.

All of the foregoing mentioned changes are possible,

and some of them are probable, notwithstanding that we cannot alter our basic individuality any more than we can grow hair against Nature's intention.

Many a man, who could have been a success in his own way, has approached failure in attempting to be somebody else. Our capacities are limited by Nature, and our natural ability cannot be increased. There is just so much in each one of us, no more and no less. We cannot create, although we may regulate and develop.

Any attempt on our part to get rid of our innate and prenatal individuality tends towards failure. Better be yourself, because you cannot be anybody else. Regulate and develop your individuality, train it to be usable, curb the manifestation of the objectionable, but do not attempt to get yourself out of your own system. You cannot do it.

Whatever you are, you must not expect to satisfy everybody, simply because that feat is impossible of accomplishment. Some folks will like you and others will not. You will have enemies if you are worthy.

The colorless man does not even shed the light of his paleness. At best he is but a reflector, and there is little warmth in reflected rays. There is nothing direct or positive about him. He is like a water-logged ship without a rudder, a captain, and a crew. He simply floats upon the sea of life, and even the rocks of trade have too much self-respect to assist in wrecking him. He is too small for disaster to notice.

Your individuality, properly mastered, is one of your principal selling assets. It separates you from other people. It takes you out of the mass. It gives you recognized character and the right to be respected.

You will be judged by your individuality as well as by your ability. Therefore preserve it, develop it, and handle it as you would any other perquisite, smoothing it out here and there, if it needs it, using the best parts of it and secreting the worst of it. But be yourself all the time, for the suppression of the bad in you does not mean loss of personality.

The individuality which antagonizes the buyer is not of the right kind for selling goods. Therefore, it must be controlled. Yet the perfectly smooth man, who never says anything with any degree of positiveness, who buries all the personality he has, will never amount to anything anywhere.

Every one likes individuality if it is properly served, and nobody cares anything about the namby-pamby man who is afraid of himself and of everybody else, and who is content to float and never to swim on the stream of business.

But while you are forging ahead there is no need of your butting your head against the rocks just because they happen to be in your way. The brave man steers away from danger. He circles the hills he cannot climb. He never looks for trouble, but he meets it when he has to. Only the fool is fool-hardy, for he alone fights the battles which are unworthy of valor.

To sell is to be at war. You are against competition, and part of the victory lies in the presentation of individuality and self-respect, so regulated, mastered, and handled, that they will enable you to win without bruising and without giving pain to either party.

Be yourself, anyway, and your better self. Get rid of all the bad you have in you, if you can. If you cannot get rid of all of it, then get rid of as much of it as possible, and let your trained and mastered personality be the salesman of your better self.

PUNCTUALITY IN BUSINESS

BEING ahead of time may waste a minute. Being on time may save an hour or a day. Being behind time may lose a sale. The late-man always rides on the last car of the train of never-get-there.

If you make an appointment with a customer, keep it if possible. Make every effort to be on time. Nobody likes to wait, and you have no right to make him wait. If you find it impossible to meet the engagement, send word to him even at great cost, and give your reasons. If your train is late, telegraph the customer. If you are taken sick, notify him of your condition.

If you are a store-salesman, always be on time. If your train or trolley is likely to be late, take an earlier one.

Better be ahead of time than behind time.

But do not keep an appointment ahead of time, for you have no right to call upon the customer earlier than you are expected. Better wait outside half an hour and enter at the specified time than to force your presence upon him ahead of time. It may annoy the buyer to have the salesman appear before the time agreed upon.

But there is no objection to being ahead of time at the office. In fact, the ahead-of-time man is appreci-

ated, provided he starts in to work as soon as he gets there. Heads of departments and proprietors of business are usually on time or ahead of time, and the on-time man is sure to attract the notice of his employer and to gain a decided business advantage over those who get in when they get ready.

The on-time man can be depended upon. The fellow behind time is neither faithful to himself nor to his employer.

No matter if there appears to be nothing to do, and if apparently there would be no harm done if you were half an hour late or more, that day may be the very one when you are most needed. If you are there, you can attend to things. If you are not there, you take big chances.

The reputation for punctuality one is of the best business assets. If you are not reasonably sure of being able to reach a certain place at a certain time, set the time ahead. Do not try to make too close connections. Many a railroad train is late. Comparatively few arrive on time.

Let us suppose that you wire a customer that you will meet him at two o'clock, which you can do only if your train is on time. Better make it two-thirty or three, allowing for a margin of safety, than to run so close that the chances are against the keeping of the engagement.

If you are coming from a distance, and are, therefore, dependent upon the trains, it is better to tele-

graph the customer, or write him, stating that you are coming to Blanktown on the train due to arrive at one o'clock, and that you will come directly to his office. If you do not reach there on time, he will know that the train is late, and will blame the railroad, not you; whereby, if you set a specific hour, and fail to meet it, the customer may not place the blame where it belongs. Even if you have notified him that you will arrive on a certain train, it is well to telegraph him while *en route* if there is a likelihood of the train being late. The courtesy will be appreciated.

Always be on time or have an acceptable reason for being late.

THE VOICE IN SELLING

THE tone or ring of the voice counts in every walk of life, except, perhaps, in that of the purely mechanical or clerical; but, even there, it is not of inconsequence.

Many a man of great mental capacity has not received his due in the pulpit because his voice was harsh and irritated his hearers. Many a lawyer failed to impress the jury because of faulty articulation.

The tone of the spoken word is of much importance, and especially in salesmanship, because there can be little of it without the use of the voice.

We are born with good or bad voices, and the man with the bad tone of voice cannot well compete with one who possesses a voice that is naturally pleasing.

But the irritable voice may be changed into one less annoying, although it never can be brought up to the standard of natural perfection.

If your voice is not acceptable to those you talk to, — and you can easily ascertain whether it is or not, — you can by care and practice change it into a less objectionable condition.

I am not suggesting that the salesman become an elocutionist, that he continuously doctor his voice; but I do advise him to take pains with it, and, if it is not what it should be, to do something to remedy the evil.

In all the large cities there are located schools of expression and of the voice. A few lessons at these institutions are likely to do much good. The experiment is worth trying, and the expense is slight. If they are unavailable on account of the distance, the advice of a physician is suggested, who can, perhaps, give you exercises which you can practice without expert instruction.

Many public speakers, and nearly all clergymen and lawyers, have been subjected to voice-education. They will assist you, if you go to them, or tell you where you can obtain help.

Even stuttering can be largely removed, and the sharp edge of a harsh voice can be toned down.

The voice, like all other faculties, is subject to some change, lends itself to development, and may be improved with proper exercise, practice, and care.

The tone of the voice is a selling asset, and no one has a right to allow this strong aid to salesmanship to be other than at its best.

So strongly do I appreciate the value of the voice in selling, that I would advise every salesman of good voice or otherwise to consult some expert on the voice, that he may help to make his good voice better or his poor voice acceptable.

WHAT TO DO OUTSIDE OF BUSINESS

INATTENTION to business kills business. Success is impossible unless one is deeply interested in his work and gives to it painstaking and conscientious attention; but no man is a full man, a manly man, a good citizen, and worthy of the respect of his community, who is a slave to business, and who keeps himself constantly under the lash of work.

It is true that some great generals of industry apparently never get out of the field of business, and enjoy neither diversion nor education, and are deplorably unfamiliar with men and things, caring for nothing save the making of money. These men, although of great business mark, are poor, miserable, and despised failures, and leave behind them neither monuments nor anything else save the disgust of those who traded with them and lived with them or near them.

So long as business remains strenuous, and selling a difficult task to perform, the major part of one's time must be given to business-doing; but this does not mean that one cannot breathe an atmosphere outside the store, or that he must live forever in the dust of business activity. It is better to be a man of health and citizenship, even at the sacrifice of some money,

than to remain a mere weigher and sealer of financial profit.

The good men do lives after them, and makers of money only are despised while they live and forgotten when they die.

Every one should do something besides business, and should stand for something besides the making of money. He should have some outside interest, enjoy some wholesome diversion, stand for something away from his shop or office, and have some kind of a reputation removed from his place of business and his bank.

If his interest is undivided, and he thinks of nothing and cares for nothing save that of making, buying, or selling, he is, at best, little more than an automatic coiner, a chained inmate in the metallic mint of money-making. He cannot be a citizen or a good husband or father. He is an obstructing cog in the mechanism of progress.

It has been said that a man without a hobby is a fool. Perhaps "hobby" is not just the word to use, but let it stand. It is a fact that men with hobbies, with interests which temporarily take them out of the treadmill of work and open to them new avenues for rest of body and mind, which utilize the anti-business-doing cells of the brain, actually accomplish more in their offices than do those who never allow themselves to be moved by outside influences.

These men, if well-balanced, do not neglect business

or other primary duties. When they work, they work. They concentrate their minds upon what they are doing, whether it be the selling of a bill of goods, the planning of a new business scheme, or enjoying a game of ball. They become a part of their environment. They are all business during business hours. They are all play when in the field. They take as much interest fishing in a fishless pond as they do in figuring profit and loss. They are rounded-out men. They seldom fail at trade or at play. They do not pretend to be literary, yet they are not unfamiliar with the best authors. They may not be of artistic temperament, but they open both eyes at a beautiful landscape of Nature or of the brush. They may not hold political office, yet they are good citizens. They stand for progress in and out of trade.

There is something the matter with you if you do not have something outside of your business which interests you. It may be yachting, or tennis, or golf, or fishing, or tramping, or gardening, or good reading, or politics, or anything else in the line of rest and progress, citizenship always included.

If you are in this condition, there is something the matter with you or with your business. You are not a good business man, although you may be a successful accumulator, if you have not the ability to do something, and think of something, besides money-changing.

Every real man stands for something which makes for better civilization, and does something which

fits him to better perform his business and social duties.

It is your duty to take up something in your spare time, and you can have spare time if you want to have it. As a matter of fact, you will work better when you work if you have something else to do outside of your working hours. Possibly you will not make quite so much money, but you will be a better man, a stronger man, and you will have friends.

Establish some kind of social life, even though you may be on the road. Do not be known wholly as a salesman, or a grabber of trade, or a hard-fisted manipulator of business things.

Be posted on something outside of your livelihood-making. Be known for something besides your business activity and trading accomplishments.

Be well-read on some subject, if you like to read; and, if you do not, cultivate the habit.

If you enjoy the water, be a good yachtsman and know how to steer your boat. If you play tennis, play a good game, and throw your heart into it while on the court.

Put the same energy, life, and interest that you give to business into the desirable things outside of business. Have something about yourself that will make friends and hold them.

The concentration you give to business should, to some extent, govern your outside actions.

Do not have too many forms of diversion. You

have not the time to do all things well, — in play or in work. Success depends upon the oneness of your interests, in your ability to keep within the circle of your choice and trade.

Good citizenship is essential, and a general knowledge of current events is necessary to manhood. Good systematic reading is a part of life-building. One does not have to read a great deal to know a great deal. It is not so much how much we read, but what we read, that counts. The persistent reading of a few publications, including a good daily paper, is a foe to ignorance and a developer of one's best faculties.

(See chapter on "What to Read.")

Work, and work hard, at your business, but do not let that be the only end to your life. Your business alone does not make a marked man of you, and the mere getting of money does not stand for lasting distinction.

The best things of life are outside of business, but business must play its part while it is necessary to maintain it.

The all-work man allows his body to wear out and his mind to degenerate. He becomes a mechanical drudge, a worshiper at the gilded monument of trade.

The golden calf is only plated.

Be something besides a business man, but do not neglect business. Round yourself out into a good citizen, for your own sake and for the sake of those who come in contact with you. You will be a better business

man for it, and you will be respected by all of your associates, and then you will lead a happy life, and when old age comes you will not be a dried-up bag of money, and there will be some jingle to your life save the rattle of coin.

WHAT TO READ

THE book does not make the man. Book-learning alone is worth practically nothing, but few men ever knew anything, or ever did anything, who did not know about books.

Book-reading and book-learning, combined with outside experience, accomplish the flush of result. One without the other stands for next-to-nothing.

There are thousands, yes, hundreds of thousands, of book-read men, who are but derelicts floating on the sea of education, useless to themselves and menaces to the progress of intelligence. They are examples of what education cannot do, — shattered, mouldy, mossy monuments of useless endeavor. They are storehouses of information, with a hundred entrances and no exits, misers of knowledge, accumulators who do not distribute.

If you would be a salesman, do not be a book-worm, for it is your business to walk and run, not to crawl.

But do not despise books. They should be a part of your social and business life. Without them you would be unfinished and unfit for all of the big things and for most of the small things.

Because there are so many good books, it is probably well for me not to designate by names the best ones for the salesman to read. It is obvious that I

cannot, at arm's length, be familiar with individual conditions and preferences. Your time is limited. You cannot possibly read all there is, or a hundredth part of the best. Read what you want to read, provided it is sensible and profitable, and remember that what you get out of what you read counts more than the number of books you read.

Taste for good reading can be cultivated. What you do not like to-day you may love to-morrow. The best way to discover what are the best books to read is to pick out what you like, and then to consult with your friends or with others competent to advise you. There are a dozen people in every community who are well-read, who know books, and who can help you. But be careful about selecting your advisers. As you are not to be a scholar or a litterateur, it is not essential to make a specialty of reading many of the works which somewhat exclusively appeal to professional book-readers. The expert literary man in advising you may shoot too high for you, or, perhaps, too low for you, because he may not appreciate simplicity and may confine his recommendations to books too heavy to float. But his advice is good if you offset it with suggestions from people who come in closer contact with every-day men and things.

The advice of any one person is seldom safe to follow, but composite suggestion is pretty sure to be good. Talk with both professional and every-day people, and then compromise between the two. Ex-

change reading experiences. Read books for the good that they will do you, and not wholly for entertainment; but do not forget that you have a right to be entertained a part of the time.

As a salesman you should know about business in general as well as about general things, and much of this can be obtained from books. Any librarian can give you a list of good business books, and intelligent merchants know something about them. If you cannot see them personally, write to them. The editor of your trade paper can be of much assistance to you.

Read a good daily paper with persistent regularity, and do not skip any part of it. Read the editorials as well as the news, and do not omit the miscellany.

Habitually read one or two local dailies, including the advertisements, especially those of the line you follow.

The newspaper is the mirror of the business and social life of its community and of the country and world at-large. It has its imperfections, but no more than those possessed by people in general, and it is, as a rule, of a grade higher than that of its community. Without the newspaper there could be little intercommunication, and most of the good in the world would be undistributed. The good newspaper is in the van of progress. The reader of a well-conducted newspaper cannot be an ignorant man.

The advertising columns always contain information of strong business value, so much of it that I would

advise all business men to regularly read at least a part of the advertisements.

Subscribe to magazines devoted to salesmanship and to general business. Do not neglect the trade paper. Read every issue of it, from beginning to end, including the advertisements. Some of the trade papers thoroughly represent the trade, and others are poorly gotten up and miserably edited; but there is something worth while in all of them. If your firm does not subscribe for them, or you cannot buy them while away, have them sent to your house or purchase them on the road. Read them conscientiously and thoroughly. There is a lot of wheat among the chaff, and if you are interested and discriminating, you will separate the good from the poor.

Not only read about the particular things you sell, but familiarize yourself with the goods which you do not sell, if the house you are working for carries them; and become familiar, by reading and otherwise, with everything pertaining to your business and to all general business which may indirectly benefit you.

Read regularly some good review, a paper or magazine which comments upon current events and which covers the whole world of information. There are several of these published, and most of them are worth subscribing for.

Read, besides, one or more magazines devoted to general literature. They will furnish you with both entertainment and instruction.

Keep up your reading systematically. Spend half of your reading time in general reading, the other half in reading about your business.

Be so much interested in your goods and in your work that you will enjoy reading everything pertaining to them, from the climate where the beginning of them grows, to the packing-boxes in which they are shipped.

WIT AND HUMOR IN SELLING

GENUINE wit and clean-cut humor are profitable commodities in any market, and should be carefully cultivated. The possessor of them has an advantage over those who are too sedate, too dense, and do not or cannot appreciate the lights and sparkles of life.

The wit and the humorist are the creators of human sunshine. They have a distinct and necessary place in the world.

I would pity, yes, I would be somewhat suspicious of the man who possessed no sense of humor. There is something the matter with him somewhere.

The man of strong individuality and of marked ability, the owner of most of the elements of success, can usually crack a joke, or appreciate one, or do both.

But wit, valuable as it is, must be handled with the nicest care. It is a delicate proposition considered commercially. It is more of a hair-spring than a main-spring. If it is always in evidence, or if there is too much of it, it is sure to work injury to its possessor. Too much wit is like a diamond without a setting, — there is nothing back of it in the way of contrast.

Selling goods is more or less cold-blooded business. It is serious to the buyer, because it takes his money;

and equally serious to the seller, because he does it for a living. Therefore, the introduction of wit, or the funny story, should be carefully safe-guarded.

The successful seller caters to the impulses and desires of the customer. He must do it or fail. It is for the buyer, not the seller, to set the conversational pace, to designate the policy of everything outside of business.

The salesman may take the business initiative, but to the seller is allowed the privilege of controlling the social initiative.

If you, as a seller, are reasonably certain that the buyer would enjoy a funny story, or a display of wit, give it to him.

Even the best of wit is sometimes considered flippancy by some men, and especially by the buyer if he is harassed and naturally morose. The best story may prevent a sale on one occasion and help to consummate one on another.

The best rule to follow is never to joke, or to tell a funny story, or to enter into any social conversation, unless encouraged to do so by the buyer.

Of course, if the salesman is intimately acquainted with the buyer, or they are warm personal friends, he then may have excuse to let down the bars at will, for this friendship carries with it social rights, but even here it is better to be careful.

The improper story is never in good taste, and cannot assist in selling goods. Even the teller of the questionable joke may not respect the salesman who outrages

decency in his stories. Unclean fun is a dangerous proposition everywhere.

But a cheery face and a genial smile are always acceptable and must work for success. They cannot antagonize anybody. They are absolutely non-irritant.

When in doubt, do not be funny. Be business-like first, humorous afterwards. Never carry your wit to a market which will not appreciate it.

RECREATION AND EXERCISE

Although I have touched upon these subjects under the chapter heading of "What to Do Outside of Business," I believe that they are of sufficient consequence for a chapter by themselves.

The book-worm and his business brother crawl through life, accomplishing little for humanity, including themselves. Voluntarily they bury themselves in books or business and forever remain in the tombs of their choice. They begrudge the hours of sleeping and of eating, and refuse to reciprocate the smile of the sun. They load, but they seldom fire. Their ammunition, procured at the cost of manhood, remains a useless thing, contributing nothing to any kind of up-building.

Occasionally we find men who stick to business at a sacrifice of everything worth having, including the better part of business. They are a detriment to trade, a menace to society.

Neither the body nor the mind can do its best without periods of rest. It is not how much we work, but how we work, that counts.

The successful and economical man economizes his time. When he works he works with all his body and mind, and when he rests he relaxes all over. He plays

as heartily and as faithfully and conscientiously as he works.

Loafing is not resting, nor does it contribute a fraction of a mite to the making or maintenance of either the physical or the mental. But the right amount of recreation, the proper letting down of the bars, the hearty laugh, the real play, contribute mightily to the building of the monument of success in every calling.

Sticking to business should not be confined to the exclusive doing of business, for it is as important to be in a condition to do business as it is to do business itself.

Few of us are so situated that we cannot get moments and hours of recreation, time and opportunity to recuperate, to make the body and mind better able to stand the strain of work.

If you would succeed, if you would develop the best of yourself, take care of yourself. If your occupation is such that there appears to be no opportunity for exercise, first make sure that no opportunity exists, and then make a change if it is possible. Yes, make a change if it requires a sacrifice.

All the money in the world is worthless if you have no time to enjoy it. The highest business or professional position is of inconsequence if there is nothing back of it or around it.

Relaxation is easy to obtain in most cases for one constantly and conscientiously hunting for it.

If you live near your place of business, walk to it

every day or nearly every day. A pair of heavy shoes, a rain-coat, and an umbrella will allow you to take your daily walk irrespective of the weather. Folks seldom get cold or become sick from being exposed to the natural elements, unless they are hot-house plants unused to naked air and sunshine.

If you live quite a distance from the office, walk a part of the way, and do it systematically and regularly. Find some friend who will walk with you, for companionship doubles the value of diversion.

When you walk, learn to walk properly. If you do not know how, find out. Your doctor will gladly tell you, and much better than I can on the printed page.

Do not eat your lunch alone. Go to lunch with somebody, or arrange to meet friends at luncheon.

Do not spend all your evenings in book and magazine study or in reading. Converse with others. Play a frequent game of profitable conversation where all at the table win.

Set aside a few evenings every week for social intercourse. Have friends come to your house and go to theirs. Do not spend all your time card-playing, but talk matters over, and have a social good time discussing all things of interest, in a light, easy, conversational way.

Do not limit your friends to those in your business. Get outside of your business a part of the time and exchange experiences with those who do not work as you do.

Play ball if you get a chance, and you can do it even in Winter. If there is a gymnasium near by, and good jolly fellows attend it, join the gymnasium, but do not over-exercise or become an athlete.

Better be outdoors than indoors. Learn to swim, and swim at every opportunity in the ocean, lake, and river, when the water is warm, and patronize the swimming school in the Winter.

Take trolley rides, so as to get a diversity of scenery; but when you leave the trolley, walk, and walk part of the way back, picking up the trolley *en route.*

Have some objective point. Do not walk aimlessly or alone, if you can help it. There is more enjoyment and real diversion in traveling a mile with a friend, or to meet a friend, than there is in attempting to walk two miles with nobody to see nobody. Get out of yourself at every proper opportunity.

Do not be so much engrossed in business that you can think of nothing else, because if you do not think of something else, and do not do something else, you will be deficient in business.

If your work requires a certain kind of exercise, take a different kind when out of the shop.

Never take any diversion without an aim or a purpose. Do not make hardship of it. Get pleasure out of it. You can if you will.

Getting physically tired in moderation, if there is nothing seriously the matter with you, means a better night's sleep and a greater capacity for work. But do

not get over-tired. There is such a thing as over-doing any kind of exercise. Never over-strain yourself or take physical chances, for the strenuous sports do much more harm than good, and often injure for life.

If you are naturally athletic, and enjoy severe exercise, do not go into it until you have consulted a good physician that you may know your limitations. It may not hurt you to get tired, but exhaustion is injurious. Do not allow yourself to always decide for yourself. No man, unless a physician, knows his physical strength or how much he can stand, and thousands of young men have driven themselves into premature ill-health by over-exercise. Consult somebody who knows.

Physicians, nowadays, are strong advocates of outdoor exercise, but none of them believe in strenuous athletics. For a few dollars they will tell you just how to take care of yourself.

Do not allow yourself to be guided wholly by books on physical culture, for the book cannot diagnose, and unless you have been professionally trained you cannot possibly know what to do and how to do it.

It is just as much your duty to take care of your physical health as it is to train your mind or do business. And it is your further duty to scientifically and intelligently find out what is best for you to do, and not to depend upon your lack of knowledge or upon the advice of the untrained.

But do not over-do diversion. Diversion is only a

part of life. The all-time baseball fan, the ever-running crank, and other kinds of athletic enthusiasts, become so much interested in outside things that they cannot properly attend to business. The extremist, either in business or in play, is a natural fool or has acquired foolishness.

There is one thing which you cannot over-stock in, and that is common sense. Apply the same common sense to your play as you do to your business, and do not allow yourself to be your sole dictator.

What you want to do in the way of play or exercise may not be the best thing for you to do.

Although dissipation frequently accompanies the action of diversion, it has no right to be a part of it.

A glass of whiskey can spoil a day of pleasure and bring you back to your work much worse off than if you had slaved in the office.

Never do anything in the way of diversion which is wholly physical or wholly mental. Combine the two. Otherwise you make drudgery of it.

But get diversion and exercise some way, and you can in most cases, if you will.

CANVASSERS AND BOOK AGENTS

COMMERCIALLY speaking, the house-to-house canvasser and peddler, and the seller of books outside of the store and the trade, are designated as canvassers or book agents. As a matter of fact they are salesmen, and none of them are agents in any sense. The act of the agent involves his principal, who is legally responsible for his doings. The book agent is agent in name only.

These sellers differ primarily from others in that they do not sell to the trade as a rule, do not stand behind the counter, do not have places of business, and do not usually sell goods to be sold again. They do not cater to any regular trade, as does the shoe salesman, for example, although they may have a selected list of customers.

It has been said that it is more difficult to sell from house to house than it is to sell in any other way. This cannot be so, because, if it is, the selling of these articles would require a very high grade of salesmanship, and men and women who apparently are not possessed of even ordinary selling ability would not seem to be able to make a living.

The expert book agent, — and allow me to use this term because it is so common, — who handles encyclopedias and other voluminous and high-priced works, —

has the fundamental characteristics of a great salesman, and probably would succeed as a regular seller of trade commodities. But the average book agent sells books because he cannot find anything else to do, or thinks that he cannot, because no capital is required, because he can usually begin without experience, and because he can work to-day and stop to-morrow, and be a sort of go-as-you-please seller. A proportion of these people do not continue in the business, but take up some other line if they can find it.

A superintendent of book agents, employing thousands of men and women, told me that anybody who could talk could sell books, and that talking was the prime requisite. The fact that most book agents are fluent talkers, whether they know how to talk or not, and the further fact that a large amount of vocal energy is expended at the consummation of every sale, would indicate that the rapid and fairly good talker would make a good book agent.

The high-class book agent may earn from $5,000 to $6,000 a year, although the latter figure is very unusual. He succeeds because he has the right selling stuff in him, is everlastingly persistent, uses good judgment, has the power of diagnosing the customer, is a good judge of human nature, and is willing to stand any kind of rebuff, even insult. These men are geniuses, and many of them would make less money in some other calling, although it is probable that they would do well in almost any selling direction.

But the rank and file of book agents and other canvassers either do poorly or fairly well, and seldom make more than a living, often because they do not exert themselves.

The book agent, first of all, should know his books and be familiar with similar works. He should carry with him, not only his own opinion about the book for sale, but that of authoritative readers, — men and women of mark, — that he may present arguments other than his own, and be ever ready to quote authorities.

He should know what the book is good for, what it will do, and how it will help the reader, especially the last. He should school himself not to be affected by constant failure, because he cannot expect to sell to every one he meets; yet he must have that persistency that will allow him to feel that every one he sees is a possible customer, and he must, while before the customer, show the confidence of expected success.

He should have a general literary or scientific knowledge of books in general, and possess the power of description. He should allow the customer to do some of the talking; in fact, he should encourage him to do so, because the more the customer talks the easier it is for him to find out what the customer wants, and he is then better able to present the book specifically.

He should be so familiar with the book that he can turn to any page of it upon request, and speak intelligently and emphatically on any point mentioned.

Many people buy books, not for their entirety, but for some particular part of them; and the presentation of some one picture or chapter may be sufficient to sell the book. It is, therefore, incumbent upon the seller to discover the likes and dislikes of the customer.

The names of prominent buyers of the book are of consequence. The agent should obtain a list of the friends of his customers and permission to use their names. Most folks, especially the common people, follow a leader, and buy what others buy.

The good book agent obtains a list of possible customers and finds out something about them in advance. He does not waste time in presenting an undesirable book to them.

The method of approach is of extreme importance. Most people seem to have an apathy against all book agents and canvassers, and they will say "no," and snap it out, even though they may buy afterwards. They may refuse to allow the agent to talk.

Great control of one's feelings is necessary. The slightest show of irritation on the part of the agent is fatal to a sale. He must meet a frown with a smile, and create a good impression at the start. It is difficult to bring a customer into a buying mood, unless the first few words, and the manner in which they are expressed, are pleasing to the customer.

Stereotyped stories or descriptions, recited in a parrot-like manner, are to be discouraged.

The agent should get in connection with others of

his class and exchange experiences. If he is at all proficient, he will learn how to meet men and women, and frame a sort of informal form of presentation or argument which is likely to work well under usual conditions.

Courage is absolutely necessary in the selling of books or house-to-house articles, because the agent generally interrupts the work of the housewife and business man, and most of them are not professional buyers.

Success requires almost instantaneous quickness, and a large amount of personal persuasion. But back of it all is that everlasting persistency and refusal to recognize failure, that schooled ability to pleasantly meet both insulting rebuff and placid indifference.

It offers a living to most people who are willing to work, and it certainly presents one with an opportunity to gain a large amount of experience.

The same principles which apply to the selling of books from house to house are equally pertinent to the selling of any other articles by canvassers.

THE ACADEMIC EDUCATION OF THE SALESMAN

WHAT should be the academic or school education of the seller of goods? It is as well to ask what should be the educational requirements of anybody about to enter any department of business.

The answer is terribly vexed. There is almost a babel of opinion concerning it. The curriculums and methods, from those of the between-town school to the university post-graduate course, show, perhaps, a greater diversity of professional and every-day ideas than exists in any other department of human affairs.

The academic side of education is deservedly receiving the earnest thought of the whole civilized world. Thousands of conscientious, highly educated, and trained men and women are giving their lives to the cause, and are attempting to formulate an educational policy which will be somewhat universally acceptable to the people at-large.

The pessimistic educator and researcher may claim that educational curriculums, methods, and policies have shown less improvement than the changes wrought in any other department of business or commercial science.

Even the optimistic man of learning is not able to refute all of the damaging statements made, for it is

quite probable that if a totally unbiased and fair jury could be impaneled that it would be able to discover ample evidence of greater improvement along purely business lines than in educational fields.

Business-doing and manufacturing have undergone an almost complete change. There are, to-day, few machines or processes which were used a few years ago; while in the educational world one finds a majority of old methods in vogue, which are acknowledged by educators to be unfit for their work; and yet these methods continue to prevail, because expert academic learning and educational direction do not seem to be as active and as progressive as is the selfishness of business.

But the book reader and the business worker, the academic researcher and the expert at trading, are getting together, each contributing his part to what cannot help becoming a profitable whole, and we may confidently look forward to the early arrival of an educational train directly connecting the school-house with the house of business.

Present academic education, broadly speaking, consists of what is given in the common schools, the high school, the classical or preparatory school, the technical school, and the college.

However much we may differ, it is impossible to find, in and out of the educational craft, any one who does not consider a grammar school education essential to any kind of business-doing.

While it is true that some illiterate business men have become marvelous financial successes, not one of them would claim that lack of education did anything for him, and probably all of them would be fair enough to admit that if they had had more school training they would have been better off socially and financially.

Therefore, I think I may safely contend that the would-be salesman, and all those who would enter business, should have at least a grammar or common school education, without which they would be materially handicapped, not only at the start but all through life. And I would most emphatically advise any one intending to enter business to graduate from what is known as a high school, an institution which is both a preparatory and a finishing school.

While attendance at this latter institution may not be considered absolutely essential, it is, I believe, of great consequence, as it gives a knowledge of men and things, which the lower schools cannot possibly present, and then it teaches one how to teach himself, makes him better able to grasp a situation, gives him a higher respect for himself, and prevents a feeling of educational deficiency.

The high school course comes at the right time in one's life, when he has finished the Three R's of Education, is old enough to better weigh educational values, and is in the best condition for the absorption of academic knowledge. Later on in life he cannot as easily

acquire the fundamentals, and he is not likely to have the time for school-room training. The three or four additional years are not wasted, and one should certainly contribute this time to academic study unless financial or other obstacles arise.

Would I advise the coming salesman to go higher academically, to graduate from the technical school, or institute of technology, or college?

If he is going to sell goods of a technical nature, graduation from a good institution of technology will broaden him out generally and will make him better able to meet his customers and to override technical and other difficulties. I would advise him to attend this higher technical school if he can do so without too great a sacrifice of money, health, and time.

But I would not suggest to the young man in financial straits that he live in a cold room and upon insufficient food, at a sacrifice of mental and bodily health, for the sake of this technical school training.

When it comes to the college or university, we find an even greater diversity of opinion. Some business men of mark feel that a college education is essential to the flush of success, while others consider it a good thing, and still others are pronouncedly opposed to it, the last believing that four years at college amount to little more than four years of wasted time for one who is going to take up a business career.

A friend of mine, one of the most expert salesmen in the country, a manager of salesmen, and an active

partner in the business, told me that out of the large number of college men starting in his house, few of them seemed to know how to take hold or to really do things in other than an indifferent and mechanical way. He said that his experience with college men proved to him that a classical education was likely to be not only useless but detrimental to success in business.

Another business friend of mine, a man with a national reputation for shrewdness and for building up and maintaining great business enterprises, is a strong advocate of a college course for those who would enter business. Although not a graduate himself, he put all of his boys through college, and as soon as a boy graduated, he was placed in one of his factories, at the very bottom, forced to wear over-alls, and to carry labor's dinner pail. This man has employed many college graduates, and his experience with them is directly opposite from that of my other business friend.

But I think the majority of business men would differ from both of the men I have described. Comparatively few of them would insist that a college education is essential, and not many of them would condemn the college graduate.

Personally I would advise any young man, whether he intends to enter business or not, to graduate from some first-class college or university, provided he can do so without undue sacrifice.

If he is poor and not physically robust, and must fight to earn his way through college without proper food or other necessities, I would most emphatically condemn a college course for him if he intends to enter business. I do not believe it is worth to him what it would cost him. But, if he can afford it, and can have it without too great a sacrifice, I believe that he will be better off in the end, both socially and in a business way.

College membership gives one an opportunity to make many firm and lasting friends. The college men are together for four or more years; they work together, sleep together, and play together. These years establish a fraternity of the strongest kind. Graduation does not break it. It remains. These acquaintanceships and friendships are an everlasting asset, not only a social one, but one which can be applied to business.

Then, the very environment of a good college is conducive to better citizenship and to the establishment of a high-grade of manliness.

College never made a fool or a fop of a boy. If he came out one, he would have been one without the intervention of the college. Certainly a college education cannot injure a salesman, unless he is bound to be injured anyway, and then it does not make much difference whether he is educated or not.

But no man of business judgment would dare to assert that a college education is essential to good

salesmanship. Success may be made with or without it. In many cases greater success with it; in some cases more success without it. It is simply a question of whether one desires a college education and can afford the time and money.

For the moment let me leave the academic side of education and consider self-teaching. No man is equipped for a living in salesmanship, or in anything else, no matter what his school education may be, if he drops learning when he leaves the school-room or the campus. Men who amount to anything are learning all the time. The store is their school-house and the street their college. There is no place in the world for the man who stops.

Good reading, conversation, contact with men and things, will do as much or more than can any educational institution, after one has learned the fundamentals.

I say this without disparagement to the school or college, because he who knows nothing of books and little of school is either a fool or is likely to be one, and so it is with him who knows only books and has never drawn from the inexhaustible library of the great outdoors.

Books and experience rightly mixed make the compound of success. Neither is worth much of anything without the other.

To sum up, let me say that probably the best rule to follow is to get all the education you can afford.

It is not wasted time if it is so you can give it. But it is unprofitable to have too much academic education if conditions present almost insurmountable obstacles.

Graduate from a high school, anyway, even at considerable sacrifice, and go as much higher as conditions will allow, always remembering that what you get at school is only the beginning of your education.

Academic training better prepares you for life by making you better able to learn, to grasp, to absorb, and to utilize.

This early school education will avail you little unless you begin to study harder after you leave school than you ever did in the school-room.

Adapt your school education so far as you can to what you are going to do. One form of academic education is essential or valuable if you are going in a certain direction, while another should be taken if your after life is to be different.

The establishment of specialty schools is growing rapidly, and in many places one can obtain forms of school training somewhat adapted to his future work. For the present, this condition does not exist except in a few centers, and is unavailable to the many.

The curriculum of the general school, although it may not be directly adaptable to your coming work, gives you a general and a somewhat broad education, which you can adapt to your necessities.

Until the schools combine both the general and broad

training with a specific training especially adapted to your needs, the best you can do is to obtain this general education, adapting its generalities to your requirements.

This general education, however far removed it may be from your personal needs, is of consequence, because, while it may not add a stone to your superstructure, it gives you a foundation to build upon.

THE VOICE OF SELLING EXPERIENCE

APPENDED are personally written articles from twenty-nine representative business men of recognized success, and of large and varied experience in salesmanship.

Every one of the writers has been, or is, a salesman of marked achievement; and all of them are either directly selling goods, or are sales-managers, or are in charge of business outputs.

None of them are theorists. Every one of them has earned his position in the selling world by coming in direct, active, and working contact with buyers of his class.

Each one tells his story from his individual standpoint, and, collectively, the articles present a composite picture of selling success.

The articles are printed as written, having been subjected only to proof-reader's corrections.

The articles appear alphabetically, by company names, so as to avoid even the appearance of partiality.

JOHN R. AINSLEY

Of the Firm of John R. Ainsley and Company, Importers and Manufacturers of Hosiery, Underwear, and Notions, Boston, Mass.

The principles of salesmanship, as applied to the dry-goods business, consist in mastering details, in securing a knowledge of merchandise and in studying human nature. To perfect oneself in the details requires perseverance, utilizing every moment of time, and an earnest desire to learn everything possible from A to Z regarding the make-up and use of the various articles offered for sale; to exercise care in taking orders or serving customers, so as to clearly understand what is wanted in color, size, and quantity; to write orders legibly; and to be correct and precise as to prices, terms, and shipping directions, thus preventing mistakes from careless writing or poor figures or misunderstandings; to be honest as to traveling expenses, and in the disposition of time that belongs to the employer; to handle samples with judgment and care, knowing that they cost money, and to be replaced means added expense; to be correct in deportment, appearance, and habits; and to have a methodical way of doing everything in a proper way, at the proper time, and in the proper place.

A knowledge of merchandise is now absolutely necessary, no half-way business will pass muster. High

schools of commerce, technical schools, and trade pamphlets are doing much towards supplying information about merchandise, and buyers, as a rule, are well posted on "what's what," so that a salesman must know what he has to offer, how to state his story, how to make comparisons as to quality and price, and must inspire confidence in himself, in his story, in his goods, and in his firm, and he must study character, know how to approach individuals (there are no two alike), and how to adapt himself to all sorts of people.

He must make himself right with his prospective customers, and prove to them that his word is as good as his bond, and that the maxim, "All wool and a yard wide," can be figuratively applied to the man as well as to the merchandise.

Brilliancy and braggadocio don't count; but plain, honest, hard work does the business every time.

FRED L. HOWARD

MEMBER OF THE FIRM OF C. A. BROWNING AND COMPANY, WHOLESALE MILLINERY AND SILK, BOSTON, MASS.; PRESIDENT, BOSTON CREDIT MEN'S ASSOCIATION

While salesmen in general are included in the few thoughts here set down, it is the wholesale and traveling distributer of merchandise who is especially in mind.

The great influence of such persons upon the traffic

of the world, the ethics of trade, and even the morals of life in general, make them not only an important consideration, but quite an interesting sociological proposition.

We sometimes hear of "Born Salesmen," and born salesmen there may be, but Salesmanship is the birthright of no one. Salesmanship is acquired, and one can no more be born with that acquisition than he can be born educated. It is true that some are born with the selling talent and take to trading naturally, but the ethics of trade, upon which all success in selling is based, must be studied to be understood and may be acquired by all.

As between the possessor of much talent and little moral sense, and one of little selling talent and a keen sense of the ethics of trade, much more is to be expected of the latter, in the end. With the talent, or gift, of selling in the highest degree, one may prove a sad failure as a salesman, as plentiful examples show.

Even with a thorough knowledge of the goods to be sold, a good understanding of human nature, patience, perseverance, industry, and the valuable possession of a winning personality, no one can achieve either great or permanent success as a salesman, without a sense of honor and justice and the constant practice of these principles.

Salesmanship is so much a matter of morals, that to be a successful salesman is to be an upright man.

The time is not confined to the memory of the very aged, when "the best end of the bargain" theory was

the prevailing policy in selling goods. Somewhat longer ago, a great English writer's comment on commerce in his time was that "honor sinks where commerce long prevails." More and more the prevailing policy is coming to be "a square deal" for all.

It was the merchant prince, A. T. Stewart, who claimed that the greatest factor in his success was the invariable practice of giving value received.

Many men, who think they are struggling against Fate, are merely struggling against the effect of a poor policy, or the lack of any policy at all, upon which to base the conduct of their business. To drop a poor policy, to learn to adopt a good one, will generally turn defeat into success.

It is one of the best policies for every salesman to remember that his own success must come through the success of his customers, and that every advantage he takes at their expense is, in the end, bound to be an injury to himself. Let him never forget the fable of "the goose and the golden eggs," that his trade is the goose that lays the golden eggs for him, and that, in his own interest, if for no higher reason, his customers' interests must be carefully conserved and assisted in every reasonable way possible.

The opposite course may at first appear to bring quicker and better results, but it will limit him to few transactions with such customers, narrow his field of opportunity day by day, and the small advantage temporarily gained will cost him the con-

fidence of the buyers he might have profitably retained for many years, and also cost him the loss of his own self-respect.

A good salesman must be a good sport. He must be a good loser as well as a good winner. He must learn to wait as well as to work, and if he is working along wise, upright, honorable lines, he is sure to win, and his success will be permanent.

It is an unfortunate salesman who does not appreciate the dignity of his work. The seller of merchandise is a factor of great consequence in the enormous and ever-increasing volume of business of the world. It is to him the importer, manufacturer, and wholesaler look for the consummating results of their labor. It is largely upon him that the reputation of his house depends, and the nature of the relations between his employer and the trade is largely in his hands.

It is also an unfortunate salesman who sees nothing in his business but labor for gain and gain for labor.

His opportunities for helpfulness, for doing good while doing business, are on every hand. The poor manager, the unwise buyer, the inexperienced and the discouraged shopkeeper, are all opportunities in his life for helpfulness, which, if improved, will not only insure business success to himself, but make his work a joy, and his life worth living. To paraphrase the poet a little:

> Where all is only a selfish gain
> 'T is useless to excel.

FRANK E. HILL

MANAGER, BROWNING, KING AND COMPANY,
CLOTHIERS, NEW YORK CITY

The selling of merchandise is not only a pleasant, but an easy task. There are three important factors of salesmanship, namely, to read human nature at a glance, having a keen interest in the merchandise, together with prompt and efficient service to the customer.

The great mistake which is often made in selling goods is trying to persuade a customer to take an article which he does not care for. This, in itself, is poor salesmanship, and while there are many definitions of salesmanship, and what constitutes a salesman, I believe the man who builds up the business and is able to take care of it from season to season is the man who would secure the most votes in a competition on salesmanship.

It was in the store of Marshall Field & Co. that I had the opportunity to study human nature and salespeople. I made application to Mr. Selfridge, who was at that time a manager of the retail store, and now a merchant of London, for a position as salesman in one of his departments. In referring to one of his best salesmen, he said: "Give me two men as good as he is and you may have him."

In reply to my question as to why he considered him so good, he answered: "He could serve more than one customer at a time, used excellent judgment in introducing the merchandise, and the customers were pleased with his attention."

Special attention to customers, without giving the impression that you are too eager to make the sale by an over-display of merchandise, is appreciated. This suggests the thought that a customer should never be allowed to leave your store dissatisfied, and a salesman will promptly report to the manager any complaint a customer may have. These matters should be handled with promptitude and void of argument in adjusting a claim, for there is no better advertisement for a firm than a well-pleased customer.

The development of young people to assume positions as salespeople requires much patience and careful instruction from their beginning until they are given a sales-book. I regret space will not permit my explaining in detail the experience in this particular part of mercantile life, as the experiences are so varied that what would fit one case would prove entirely out of place in another.

It is a mistake to try to have young minds absorb the fundamental principles, even in selling goods, in a short space of time; but careful instruction at a well-defined time, say, immediately after they have served a customer, and you saw that the customer was not entirely satisfied with the manner in which

the goods were presented or with the knowledge the salesman seemed to have of the merchandise; then is the time to correct them, and if they are quick to absorb, it will not happen the second time.

It often occurs that the salesman will say "No" (when a customer asks for some specified article), "I am unable to give you that," instead of introducing something which is a little superior, or even a little less in price, where this same customer was given to another salesman, and in five minutes made a purchase of items which were already in the store, but had not been shown. This would come under the point of good salesmanship.

W. ATLEE BURPEE

HEAD OF THE FIRM OF W. ATLEE BURPEE AND COMPANY, GROWERS OF SEEDS, PHILADELPHIA, PA.

One basic requirement for a successful salesman, to-day, is absolute integrity and honesty. He must neither lie nor misrepresent in any way, and naturally he cannot afford to be connected with a house that would permit misrepresentation, either as to quality or value of goods. This may not have been true a generation ago, but the standard of business ethics has advanced so steadily that now no house (and no salesman) can be permanently successful unless they

gain (and deserve) a reputation for plain truth-telling and square-dealing.

Salesmanship to-day, being upon a higher plane, is more attractive and offers better inducements to young men than ever before. The salesman must, of course, understand thoroughly the character of the goods he is offering, and their value. He must be imbued with a spirit of loyalty, and really believe that "our house can do no wrong," at least intentionally. He must feel himself, — and thus impart to his customers, — the confidence, that were he the *buyer* instead of *seller*, he would *buy* from the house for which he is selling.

The methods of successful business, to-day, are not based upon the ancient idea of "trying to get the better of the other fellow." In a broad sense, the interests of buyer and seller, instead of being antagonistical, are really mutual. It is only by "repeat orders" from satisfied customers (whether at wholesale or retail) that it is possible to maintain a prosperous business.

Rather than dwell upon other important requisites of good salesmanship, perhaps it would be more suggestive to the readers to state "one reason why" a dozen years ago we ceased to be represented "on the road," and became at wholesale, as we had always been at retail, "exclusively a mail-order house."

A traveler would send in orders for peas, beans, and other seeds at "cut" prices, and when we protested,

would offer the excuse that so-and-so were quoting those prices. My instructions would be, that while you must never run down a competitor, yet you should maintain the position that *you* were not selling Smith's or Brown's, but Burpee's seeds, and you knew that Burpee's seeds were *worth* the prices asked; they would bring more at retail and make satisfied customers. In other words, in such a business as garden seeds, it would pay to handle only the best grades possible to produce, and these could not be sold at the prices of "cheap seeds" to "quality-buyers." I found it almost impossible, then, to train a salesman to be willing to lose an order rather than attempt to meet competition merely in price. This may have been as much my fault as that of our salesmen. To-day, it would be easier for both of us.

However, for the past decade, we have reiterated in millions of catalogues (*our* "Silent Salesmen") the fact that:

We travel many thousands of miles each season to inspect growing crops, which are produced for us under special contracts throughout America and Europe, but never travel a single mile to solicit an order. And yet we want your trade, if you can appreciate the value of quality in seeds.

MARCH G. BENNETT

GENERAL MANAGER, SAMUEL CABOT, INC., MANUFACTURING CHEMISTS, "CREOSOTE SHINGLE STAINS," BOSTON, MASS.

We all agree that the road to successful salesmanship, like that to other heights of achievement, is unknown, but I believe that the surest and best road that we do know, in this or any other vocation, is hard work, intelligent, courageous, and persevering.

I disagree with the old saying that "salesmen are born, not made." Like most old sayings, it is only a half truth, and is discouraging.

Granted that fluency, geniality, and assurance are important qualifications, it is still true that they alone cannot make a successful salesman (or politician), and the man who possesses these qualities in abundance is less likely to be a hard worker, a student of his business, and a trained expert in his line, than the man with a smaller equipment of these superficial advantages, because the latter finds that he cannot rely entirely upon his personality, as the other man is apt to do, but must work for his success.

In every line, — business, politics, law, and athletics, — we see numerous examples of men who seem to have been especially equipped by Nature for success distanced by others whose one advantage over them is that genius which is *the capacity for hard work.*

The combination of these qualifications, of course, produces the brilliant success that establishes our standards, and, if we argue solely from such examples, a successful salesman must possess all the qualifications which Dr. Johnson required to make a poet, and then some. But, in my judgment, the average intelligent young man who wishes to become a salesman can succeed by hard work, using his brains to study his business and his customers and to sustain his courage. He can educate himself in the science and diplomacy of his calling. He will learn all those standard maxims, — never to misrepresent his goods, never to really lose his temper, to restrain an eager customer from buying too heavily a line that is not adapted for his trade, to force goods upon a reluctant customer that he knows will sell, never to forget that unless he is loyally representing his house he is not making headway; and, more, he can acquire a reputation for complete knowledge of his business that will sell goods and recommend him for promotion. When promotion comes to such a man, he is equipped for it, because he has made himself competent by hard work directed by intelligence.

Therefore, without denying the great benefit of certain accidental talents, I believe that no young man who wishes to become a salesman need be discouraged if he lacks those talents in abundance, but has brains and force.

HERBERT M. SEAVER

SALESMAN, COBB, BATES AND YERXA COMPANY, WHOLESALE AND RETAIL GROCERS, BOSTON, MASS.

The first requisite to become a good salesman is to be honest, not only with your employer, but with yourself as well. Always be obliging and courteous, never familiar. Never make a promise that will be doubtful to fulfill. A good memory is a very great asset.

Cultivate the ability to recognize customers and call them by name. Familiarize yourself with original packages and their contents.

Study prices, so that at any time you can readily quote them.

Enable yourself to write swiftly and legibly.

Never let your customers feel that you are in a hurry; your time should belong to them.

Never watch the clock. The moment you enter the employ of a firm, you should always be willing to do a little more than is stipulated in the agreement, if you aspire to grow in their esteem.

Many times you will find it impossible to go to your meals on time; and, perhaps, you will find it advantageous to your future interests to return before your meal hour has passed.

Much more might be said, but, in my opinion, a man with the foregoing qualities would be a desirable salesman.

JAMES G. BERRIEN

NEW ENGLAND MANAGER, "COLLIER'S WEEKLY," NEW YORK CITY

"Zogbaum works with a pencil: I do things with a pen —

"But you sit up in a conning tower bossing ten thousand men."

So says Mr. Kipling, with a little touch of envy mixed with admiration, to one of our admirals.

It all depends upon the viewpoint as to how much glory a man can descry in his work. There is a certain class of servants in England that counts it a glory when a son adopts his father's calling, and it is a glory to them. Four or five generations trained to wait on others have given England the best servants in the world. Four or five generations of skilled laborers have given England the reputation of making the finest guns in the world. There is a touch and feel and balance in an English gun that is the inheritance of fathers', grandfathers', and great-grandfathers' skill passed on. It is inimitable.

So, in this country, cases might be cited of succeeding generations taking up the same calling, — law, ministry, medicine, merchandising.

There is a business which has grown to enormous proportions in this country in the last fifteen or twenty years. It is too young a business to have engaged the energies of grandfathers, and there are very few fathers whose sons are old enough as yet to take up the same calling. It is the business, — some prefer calling it a profession, — of advertising.

There is coming a time when fathers, now engaged in the profession of law or medicine or in mercantile pursuits, will be as proud to have their sons take up this calling as they now are to have them go through college and take up a profession.

There is no more fascinating and absorbing business open to man. It is a young man's business. "Kipling does things with a pen — the admiral bosses ten thousand men." The editor has his influence on the thoughts of his fellow-men. The advertising man furnishes the sinews by which the editor is able to carry on his work of moulding public opinion. He makes barren lands give place to new factories. He gives more than a living to thousands and thousands of people. Ten years ago, the only place you could get a certain article was over the counter of a little retail druggist in Cleveland. Four or five thousand people to-day owe their living to the first small advertisement for this product placed in a national paper within the last ten years.

The advertising man is not restricted in his appeal to one audience. If necessary, he can talk through all

the magazines, all the newspapers, the bill-boards, the street cars, the mails; every channel of publicity is open to him to carry the news of his wares, to mould public opinion to believe in the product he is selling.

Can there be any more inviting field for a young man of enthusiasm? To tell of new products and mould opinion regarding merchandise of all sorts; to help editors reach vaster audiences through furnishing funds with which to gain greater circulation; to create new work for the workers of the world by widening markets; to minister to declining or stagnant enterprises, giving them new life; to turn barren fields into whirring homes of industry; to reduce the cost of selling goods in the line from the manufacturer to the ultimate consumer; — these are indeed substantial contributions in the way of service.

No profession offers better inducements to brains and personality. These two things are prerequisites of advertising, for one must have brains enough to see the vision of widening trade and deepening the channels of opinion, and one must also have the force and personality to show this vision to the manufacturer; and, having convinced him, he must have the endurance and courage to make the vision a vital truth.

The man who swings an arch across a mile-deep gulf, the man who rides his chariot over the avenues of the air, the explorer, — how can we bring them under one category except as pioneers? The regions of advertising have as yet been scarcely staked out,

and the need of recruits is heard on every side. It is the business of life we are in, and our pioneers must be intelligent, persistent, and wide-visioned.

There are two types of sellers of advertising, as there are two types of salesmen in every line, — the man who thinks and the other kind. The man who feels the lure of the business, but lacks the imagination and brains, is being rapidly displaced. The man who goes to a manufacturer and asks, "Anything for my paper to-day?" is being displaced by the man who constructs a concrete plan of advertising and sells it as a proposition worthy of the investment of the manufacturer's hard-earned money.

To be a salesman of advertising, one must answer to the following tests: He must have the inclination and the ability to create ideas of such sensible fiber that they will invite the attention of the prospective buyer. He must be able to win the prospective buyer's utmost confidence, for in no business is there a larger call on the faith of the buyer. He must be of such high personal integrity that he will not build a false plan for immediate gain, and he must have horse-sense enough to know that the creations of his mind have their basis in sound principles. And with these special requirements, he must have all the fundamental requirements of a salesman, such as enthusiasm, sincerity, persistence; and each of these essentials he must have developed to an unusual degree.

AUSTIN H. DECATUR

PRESIDENT, DECATUR AND HOPKINS COMPANY,
WHOLESALE HARDWARE, BOSTON, MASS.

In my opinion, the requisites for a good salesman are character, address, tact, a thorough knowledge of the article to be sold, and enthusiasm.

Character. "Character is not determined by a single act, but by habitual conduct." It is not formed in a day, nor can it be purchased or inherited, but must be planted in early life, and cultivated and ripened into a manhood which will win the confidence of all with whom it comes in contact. Confidence in the seller makes it easy for both buyer and seller. When a buyer has no confidence in the seller, the seller's usefulness is lost, and the goods must sell themselves or remain unsold.

Address. "Address is needed to gain the attention of the buyer and hold it until the acquaintance is made, and then character or the man will hold the confidence of the buyer." A salesman cannot be too particular about his general appearance and personal address.

Tact. "Tact is the judicious use of one's power at the right time." No salesman ever accomplished very much without being tactful. There are all kinds of people to deal with, and one must be able to adapt himself to the person and condition.

All the foregoing are important requisites for a salesman, but they are all lost sight of in comparison with a knowledge of the goods or articles to be sold, and this knowledge can be obtained only by study and hard work. If it be a general line of goods, one must begin in boyhood and spend years of time in learning, not only the goods to be sold, but the general business policy or management, in order that he may be in touch with the whole situation, and do justice, not only to his employer, but to his customer.

My experience with salesmen is that no one has ever been able to learn two or more kinds of business, and be an expert at either. Life is not long enough to master and make a success of many things. We must make a choice of some one thing, and stick to it until we win, and if we are enthusiastic and happy, we are sure to win.

One may know all about the goods he wishes to sell, and yet not meet with any great degree of success, unless he is enthusiastic and able to impart this enthusiasm to the other fellow. No young man of to-day can succeed to any great extent who is not enthusiastic in his business or occupation. In this day of sharp competition, half-hearted, indifferent methods will not suffice.

To sum up the subject, I feel that knowledge of the articles to be sold, and knowledge of the business with which one is connected, are the first great requisites; and enthusiasm which springs from loyalty to the em-

ployer or manager of the sales-department, and for the merit in the article itself, is of equal importance.

To sum it all up, the secret of success in selling goods, as well as in any other occupation in life, is WORK. The world is full of people who are too proud to beg, too honest to steal, and too lazy to work; they are the most to be pitied of any class.

FRED H. TUCKER

MEMBER OF THE FIRM OF FARLEY, HARVEY AND COMPANY, WHOLESALE DRY GOODS, BOSTON, MASS.

Selling goods successfully is an art, and one that needs to be studied as carefully as any of the so-called "higher arts." The necessary preparation may be considered under three heads:

Knowledge of yourself.

Knowledge of your goods.

Knowledge of your customer.

To know yourself, wherein your greatest powers of persuasion lie, what your limitations are; to learn to use your best weapons and discard your weaker ones; and to always be yourself and not try to be an imitation of some one else; are of first importance.

Equally important is it that you should know as much as possible about what you have to sell. The art student must spend weary years studying anatomy, architecture, or engineering, according to the subject

he is to paint. So must the salesman study, that he may say, as did the successful German who was asked why his sales were so much larger than his competitors', "No man can ask me a question about my goods that I cannot answer."

This leads to the third important factor in a salesman's success: "Know your customer." Study him as carefully as a general studies the fortifications he hopes to storm successfully. Find out the conditions that are likely to make him want your goods, also those that will work against you. Study his temperament. If you have an opportunity, learn all you can about him before you meet him, — his outside interests, as well as his business interests. Then, and only then, are you fully prepared to meet him to the best advantage.

With these foundations well laid, last, but not least, cultivate your imagination, — for it is a most potent factor. If selling to a retail dealer, try to see in your mind the goods in his window and on his counters; see the people admiring and buying them; or, if you are selling to a consumer, see him in your imagination wearing or using your goods with pleasure or profit to himself. Get the picture fixed so well in your mind that you can make the customer see it, and your sale is made.

William Morris has said: "Art is the expression of a man's joy in his work." This is as true of the well-equipped salesman as of other artists.

Know yourself, know your goods, and know your customer; and with plenty of hard work you will succeed and get real pleasure from your work. Be an artist in your business.

EMILE PICKHARDT

SALES-MANAGER, GEORGE FROST COMPANY, MANUFACTURERS OF HOSE SUPPORTERS AND "BOSTON GARTERS," BOSTON, MASS.

I once asked a young lady, highly successful in growing flowers, as to her methods. She replied: "I'll tell you a secret, — don't give it away. You must just love them." In disregarding the young lady's injunction not to "give it away," I am giving away at the same time at least *one* of the secrets of successful salesmanship: The salesman must "just love" his work.

So much has been said on this topic by able salesmen that discursive detail would seem superfluous, but it may remain to be noted that the old saying, "Salesmen are born, not made," is true only in so far as ancestral qualities of mind and personality are concerned. Some dominant factors of success in this calling are simply acquired largely by discipline and training in childhood and adolescence, but more particularly by actual experience on the road.

Naturally, under the head of inherited qualities, come native enthusiasm, patience, and a kindly dis-

position. These last-named factors are, in themselves, almost fundamental. The "I don't care," or "That be hanged," spirit is, of course, fatal to success. The man who "goes in to win," regardless of educational, mental, physical, or social handicap, is bound to make his calling at least a comparative success, sooner or later.

It is self-evident that to insure the most permanent success in this vocation, the most faithful and painstaking attention to detail is imperative. Every promise must be kept. No matter how small a customer is, he must be treated with exactly the same courtesy and consideration as a large one. *He may grow*, and if you help him, he will help you.

Absolute honesty is a first requisite in truly successful salesmanship. But to be honest with one's trade, a salesman must believe in his own goods. Every salesman should make himself thoroughly familiar with all points of excellence of his line and *never* allow his faith in his house to waiver. Rather than this, it were better to seek other connections. He should, also, have constantly in view the improvement of his line and keep his house informed of what is "doing," so that they can, by comparison with other goods, keep abreast of the times with theirs.

Some salesmen have such an abundant fund of enthusiasm that they can sell almost anything; but, while enthusiasm is an all-important factor, it does not necessarily in itself constitute *salesmanship;* and,

where there is danger of its leading to misrepresentation, it had better be curbed. Nevertheless, true enthusiasm, when based on absolute faith in one's goods and the integrity of one's house, is as contagious as the measles, and when a buyer and his department force have caught it from a salesman it usually lasts a good while. I have known such cases of contagion to be incurable.

Finally, a salesman must be a *gentleman*, whether by nature or by training, — not a gentleman merely in outward appearance and deportment, but also "*at heart.*" This is perhaps the most important thing of all. It goes deep down under the surface and into the very nature of things. There is something almost magical about the personality of a right-thinking, broad-minded gentleman, who has taken his degree not only in mere goodness, virtue, and form, but who has through the great tests of life been enabled to enter into the heart of humanity, and, by this process, come out beyond and above the mere ethical code, and is daily living in that well-spring of love for and sympathy with all human kind which makes him at once kin with all Heaven and Earth.

A salesman who has thus achieved more than mere smartness or ability, who no longer regards the world at-large merely with the cold eye of personal advantage, if he fortunately possesses the other requirements, may feel absolutely sure of the greatest possible success in this calling, for this last-named quality finds

immediate response in the heart of the buyer. The latter at once senses *more* than mere perfunctory virtue and ability in the atmosphere surrounding such a personality. He senses a *compelling attraction*, a spiritual magnetism, which may always be predicated of a man when he has arrived at the point in his metaphysical growth where the injunction "that ye love one another" is no longer to him an empty formula.

ALLAN C. EMERY

MEMBER OF THE FIRM OF GOODHUE, STUDLEY AND EMERY, WOOL COMMISSION MERCHANTS, BOSTON, MASS.

In order for a young man to become a successful salesman he should first of all have a thorough training of the goods he is to sell, so as to have a better knowledge, if possible, of the goods which he offers than his customers have. He should be frank and honest, and secure his customers' confidence by representing his goods fairly, and should see to it that his deliveries are equal to sample. "His word should be as good as his bond." He should study his man, find out his needs, and see that he has what the buyer wants when in the market.

He should not be small, but waive little points and get a reputation of being liberal. In every possible way he should try to please his customer, — "play the long game"; that is, he should so use a customer that

one sale will mean many, and once a customer is secured, he should see to it that he is never lost.

When the young man makes a mistake, he should confess it quickly, and do the right thing. He should avoid useless argument and remember he is paid to get orders.

He should work hard and ceaselessly, not like a way train that makes sudden dashes and then comes to a stop, but more like a freight train that is continually plugging along, not fast, but keeping everlastingly at it.

He should sell when a customer wants to buy, and not pass him up, and later urge him to buy when his wants have been supplied. When he is thrown down, he should bob up again smilingly. He should be happy and good-natured, and make friends. He should treat the office boy right, he may be the buyer some day.

He should never get discouraged, but have faith in God and man and in himself. He should believe in his goods and in his house, and talk them up with great enthusiasm.

He should cut out cigarettes; the odor of them is offensive to many men, and it has been conclusively proven that they seriously injure a young man's mental ability. He should cut out booze and other evils. It is not necessary to drink to effect sales; on the contrary, a young man needs to have his body pure and his mind clear and alert to accomplish the best results. It is easier to be a total abstainer than

a moderate drinker. He should always be ready to sacrifice pleasure for business, instead of business for pleasure, which is so often done. He should be thorough, and learn to concentrate his efforts where they count.

A good motto to have is: "I can if I will."

ALBERT BERREY

CHIEF-SALES-MANAGER, ISAAC HAMBURGER AND SONS, MEN'S CLOTHING, BALTIMORE, MD.

"I walked four blocks out of my way to come to this store to buy a fifty-cent tie because you wait on me so well!"

This expression I overheard while standing in our neckwear section the other day, and, most naturally, it made me stir and study the cause. The sales-person to whom this remark was addressed was a *master of her stock*. The knowledge this person possessed of the goods coming under her care was a pleasure to behold, as there was nothing one could ask her for that she could not immediately place her hands on.

After nearly twenty years of hard-earned experience, I sum successful salesmanship up primarily under the heading: "I fully understand the goods I handle."

Be a salesman ever so homely, — too large or too small, — even unfortunate as to the command of the English language and possessed of many other faults, if this person will be ambitious enough to "fully understand the goods he handles," his success is assured.

I have seen busy men wait many minutes for a certain sales-person to serve them, and surely for no other reason than that sales-person was capable of explaining in details the whys and wherefores of the articles in question. This not only means that he or she could tell what the fabric was, which article would wear better, what colors would blend better; but the promptness in quickly finding a desired article more than compensated for the possible original waiting to be served by a particular sales-person.

There is a decided air of confidence displayed by people who "understand the goods they handle" that makes salesmanship an easy matter, but beyond question of doubt one must study thoroughly the stock one handles and be able to converse intelligently regarding each and every article brought forward.

This summary, while thus far written of the retail sales-person, holds with equal force regarding the wholesale; in fact, even to a greater extent. Wholesale salesmen invariably call on very busy people, buyers whose every moment is seriously occupied, and he with knowledge regarding his wares is he that wins the prize.

I cannot too strongly urge upon those desiring to be good salespeople:

Study your goods.

Learn your stock.

Know what you are talking about.

And do not trust so much to luck.

THOMAS S. HALL

SALES-MANAGER, HAMILTON, BROWN SHOE COMPANY, MANUFACTURERS AND DISTRIBUTERS OF BOOTS AND SHOES, ST. LOUIS, MO.

The qualities that go to make the great salesman are not different from those necessary to the making of a great merchant. There is an inexorable law governing success in salesmanship that must be respected, and this is the same law that governs all men who are really great. I am not one who believes in its entirety the aphorism that salesmen are born. True, we have different qualities of mental and physical make-up born in us, but the man of average mental and physical equipment may become a great salesman by using as a basis of his work the qualities of character, energy, and perseverance. These constitute the arch of success, the first named being the keystone. In my judgment, it is difficult for any man to be a great salesman who does not possess the first-named quality. He may possess the qualities of energy and perseverance and apply them vigorously, yet in the noise of the battle he can never be heard, for the reason that his lack of character is speaking so loud the trade cannot hear the words his tongue utters. While, if he possesses much character, every word, every act, is productive of results, and this must be so whether

the customer will or not, and this principle must ever be true so long as men live.

My experience has been that buyers invariably are attracted to the big, wholesome, clean, courageous man, rather than to the weak, boisterous, unethical coward.

The most influential tongue in America, to-day, attracts attention, not altogether because of the words uttered, for its possessor is not an orator, but because of the bold, aggressive, moral force behind the words which burn his thoughts into his hearers' minds. These virtues are the same as are being sought by the large business houses, knowing, as they do, that they are judged by the character of their representation. Men possessing these virtues are valuable for the reason that they lift a house onto a higher plane than could be reached, save by the presence of such men, and such are few, not because of physical or mental inefficiency, but because they do not respect the law of success, which demands they shall not hear the siren's song, shall not feel the heat and cold, shall not realize the dark of night, shall not indulge the fleeting pleasures of life, but shall concentrate their minds upon their work until they burn with enthusiasm.

The great salesman must be a student of men, and until human nature changes this will constantly excite his mind, for each day he will come in contact with a disposition new to him, and to succeed he must

be trained in the art of diplomacy, never for a moment forgetting:

"How sweet and gracious,
Even in common speech,
Is that fine sense
Which men call courtesy;
Wholesome as air,
Genial as light,
Welcome in every clime
As breath of flowers;
It transmutes aliens
Into lasting friends,
And gives its owner
Transport 'round the globe."

W. A. HAWKINS

SUPERINTENDENT, JORDAN, MARSH COMPANY, DEPARTMENT STORE, BOSTON, MASS.

MY DEAR MR. FOWLER, — Your favor informing me that you are writing a book on salesmanship duly received, and I want to tell you how glad I am to know that you realize enough the importance of salesmanship to write a book about it. May your tribe increase!

Few people realize the importance of salesmanship. It is an art. I would gladly add dignity to it by listing it among the professions, if you please. Perhaps more discredit has been cast upon this profession than upon almost any other, due to thousands who claim to be sales-people, but who in reality are not.

There is much "Quack" salesmanship in the world.

It is an encouraging sign, however, that people like yourself are realizing more and more the absolute necessity of a thorough training in order to become efficient in this work.

Perhaps one reason why many people have given so little thought to the great importance and dignity of salesmanship is that, like the air we breathe and the sun that shines upon us, it is so common. How little there is in the world into which salesmanship does not enter! Did you ever stop to think of that?

A beautiful picture, through which the artist expresses divine beauty, must be sold. The book, through which the author may change the thought of the world, must be sold (and how hard it sometimes is, artists and authors can tell you), just the same as the common commodities which change hands in the market place.

The Jordan, Marsh Company, intent upon improving service to patrons in the same ratio that other things are progressing to-day, started some time ago a School of Salesmanship, placing their best talent at the disposal of the school. Old and new employees in the store are given instruction.

It is my custom to address each class at the close of the term, at which time I always bring out a point which I would suggest that you make use of in your book.

My method is as follows:

Assuming a serious manner, I say to the class:

"As you are about to enter the employ of the Jordan, Marsh Company, there is one very important thing that you should know, and that is, who is the boss in this store. *Now, who is the boss?*" I ask, pointing to some eager student. The answer usually comes back, "Why, you are." I reply, with emphasis, "Oh, no! I'm not the boss." Again I ask, "Now, who is the real boss in this store?" All are intensely interested now. Positive voices in chorus now proclaim a member of the firm to be the real boss. I say again:

"Oh, no! He is not the boss. *The boss in this store is the customer.* It's the customer that you and I are working for. It's the customer that you and I are here to please. It's the customer who pays your wages and mine. If it were not for the customer, you and I would be looking for a job, and we might not get as good a one as we have here.

"Now, if you are sitting behind your counter, doing nothing, and you see me coming, don't jump up; but if you see the customer, the boss, coming, jump!"

This line of argument always makes a strong impression, and it strikes the key-note of good salesmanship, namely, *satisfactory service to customers.*

Wishing you much success in your work, I remain,

Very truly yours,

W. A. HAWKINS.

DELLA B. BEAN

PRINCIPAL OF THE JORDAN, MARSH COMPANY SCHOOL OF SALESMANSHIP

The department store offers the sales-people unusual opportunities for getting a great deal of satisfaction from the work. This is because of the great variety in the work. The huge, modern department store is a world in miniature. The markets of all countries are scoured for the best kind of merchandise. Almost every conceivable need of humanity is catered to. Then, again, consider the variety of customers. Nothing is more interesting and helpful than the study of human nature, and what greater opportunity could there be for such study than in selling merchandise in a department store? Every customer is a different study, and requires different treatment in order to obtain the best results.

Under the circumstances, what line of business could offer a greater field for enthusiasm? The best merchandise of the world is given the sales-people to sell. In many departments, such as pictures, laces, furniture, china, bric-a-brac, rugs, etc., the highest forms of artistic expression are shown.

We all, to some extent, have a sense of the beautiful in us, and it would be strange if such merchandise did not make a direct appeal to us, and if we did not be-

come interested and enthusiastic about it. The same thing applies to all merchandise in the store. It has different prices, different styles, different materials, different makes. There is a reason for each difference in price. Styles are constantly changing. New styles, popular styles, extreme styles, and novelties are always coming in and going out. Each has its ear-marks, its desirable and undesirable qualities. The history of the production and manufacture of all merchandise is full of interest. Different materials are adapted to different uses for this, that, or the other reason. The range of valuable and interesting information about the goods in each department is without limit, and all the information is easily within our reach, if we are willing to acquire it.

A careful study of the merchandise in a department, comparison of different materials and makes, to note the points of difference, the reading of trade journals, books on special topics, and encyclopedia, — all of which are readily accessible in large cities, — are some ways in which a sales-person can become a store-house of valuable and interesting information about the goods he is selling. Moreover, buyers are always glad to give sales-people the benefit of their long experience and accurate knowledge, if they show enough interest and enthusiasm to ask for it.

A customer comes to your department. He is not antagonistic, and you don't deal with him at arm's length. He comes to buy, and he is glad if you can

satisfy his wants. He comes very often also for information about the merchandise, and is always pleased to obtain it. You, on your side, have the best merchandise that can be procured, sufficient in quantity and variety to satisfy any reasonable demand. You have the utmost confidence in the goods you are selling. You can answer all questions the customer may ask. You can and do explain the different kinds, the reasons for the different prices, why some kinds are better suited than others for particular purposes. You can give all kinds of curious and interesting facts about the merchandise. You size-up the customer, and note his apparent station in life, his age, figure, complexion, probable taste, etc. You adapt your tact, and display accordingly. You note the effect that is being produced on him by the different kinds of merchandise shown. You can judge his likes and dislikes. The evident enthusiasm which you have for your work is infectious. It cannot help but make an impression on the customer. He can now purchase intelligently. He is impressed with your knowledge and honest enthusiasm, and relies on your judgment. He has confidence in you, and shopping to him is no longer a drudgery, but becomes a pleasure. Other customers approach, but they are different customers, of different manner and different tastes. You notice the difference, and adapt yourself accordingly. But your intelligent knowledge and enthusiasm always have the same successful result, — satisfied customers

who invariably seek you rather than the dull, indifferent sales-person in the same department.

Can this work, with all its variety and its interesting features, be called a hardship? Is n't it a fit subject for enthusiasm? And is n't there something radically wrong with the sales-person who is so blind to the possibilities of the work that he does n't seem interested and enthusiastic about it?

I have mentioned the possibilities of the work, which of themselves should arouse enthusiasm in us. There is always satisfaction in doing work in the best possible way, and this feeling of satisfaction is sufficient for doing work well.

But there is another possibility, which in this commercial age makes a strong appeal to most of us. Intelligence and enthusiasm, which make first-class sales-people, also pave the way for more important positions. The interest in our work, and the knowledge of our work which enthusiasm creates, are just what will enable us to rise to buyers' positions. Nothing else is necessary. Sales-people who have these qualities are too valuable to the store to remain long as sales-people. A department store can always get all the ordinary sales-people it needs. The supply is greater than the demand. But a department store cannot always get competent persons to fill the more responsible positions, and is always on the watch for them.

JOHN C. JUHRING

PRESIDENT, FRANCIS H. LEGGETT AND COMPANY, IMPORTING AND MANUFACTURING GROCERS, NEW YORK CITY.

A salesman to be successful must have some natural qualifications, plus energy, stick-at-it-iveness, and tact, combined with reliability. He must understand his business thoroughly and be able to talk intelligently and enthusiastically about his bonds, or real estate, or merchandise, or whatever he sells. Then, if he values the importance of presenting a good appearance, is particular as to his habits, and realizes that he must make himself profitable to his employers as well as guard the interests of a prospective customer, — he is likely to reach the top rung of the ladder in successful salesmanship.

In our weekly meetings we try to impress upon our younger or junior salesmen the importance of neatness in dress, as well as personal appearance generally, of never entering a store with a cigar in their mouth, and of never discussing a subject other than business.

We also endeavor to impress upon the minds of such new salesmen that our house has won its place by reliability, and by never misrepresenting an article and we expect them to follow along this same line.

J. WILLIAM NAYLOR

TRAVELING SALESMAN, THE MENIHAN COMPANY, SHOE MAKERS FOR WOMEN, ROCHESTER, N. Y.; PRESIDENT, THE SHOE TRAVELERS' ASSOCIATION OF CHICAGO

The foundations of a great structure, after the excavations, are very unattractive, and yet they are the vital portion of the building, for its subsequent architectural beauty and adornment. People will pass by, but not until the attractive points are forced upon the attention of the public, will they ever be spoken of. But who would build without a good foundation, except a Fool? The successful business man must build a good foundation, or else his business will crumble; and this follows in all parts of life.

There is a science to salesmanship, which has to be worked out, which is necessary and essential in all parts before a man is a success.

In looking back for the requirements of a good salesman, and judging by those now living, and by some who have passed away, I can recall men of different temperaments, of entirely different ideas, men of different political, social, and religious sympathies; and they were all equally successful, not because they sold to their own types, but because they could count as their friends and patrons men of the opposite type, because they had certain marks in their natures that

stood out differently from other men. These "nature marks," as we may call them, were the foundations. The edifice of this type of man can never be shaken. It is built to stay, on the solid rock.

The essentials to this character can never be assumed or copied. They do not belong to the penitent; they must be the original, which can never be counterfeited. I should place them:

First, truthfulness. There are usually two ways of lying in business, — one is to lie audibly, and the other is to keep still when we ought to tell the truth and act the lie.

It sometimes takes nerve to tell the truth, but it always wins out.

The second essential, I believe, is promptness. So many days have been lost to a salesman by the tardiness of buyers! A man who has no regard for promptness is already a failure, and there is no excuse for a salesman's being tardy because somebody else is. A salesman should regard his dates the same as catching a train.

I believe industry should fit into the third place. To make good at any vocation, we have got to work. In this age of hair-splitting competition, the "race is to the swift," and the man who gets at them early and late is a sure winner, in competition with the man who indulges in quantities of slumber, if he has the essentials.

Cheerfulness we will name for the fourth place.

Were you ever down, away down, when death was almost welcome? A somber friend calls, and you have his sympathy. A cheerful friend calls, and you have his inspiration.

It is in understanding men that a salesman makes his mark in life, saying the right thing at the right time, saying nothing when there is nothing to say, being aggressive when there is something to get, standing by an absent friend, — all these come into a salesman's life.

The first duty a salesman owes to his employer is to fully understand the product of his employer, and then sell it just as his employer would sell it.

We are all inclined to put our own personality into our sales, instead of putting our personality into our employer, and, through him, into the product. A salesman should always remember that he is the middleman between his employer and his customer, and that what he says and does create a binding influence or cause a breach.

I believe, with all sincerity, that if a salesman will stick to the essentials, he cannot help being a success.

GEORGE H. BARBOUR

VICE-PRESIDENT AND GENERAL MANAGER, THE MICHIGAN STOVE COMPANY, DETROIT, MICHIGAN

The requisites of a good salesman, in the opinion of the writer, consist largely in his personality. There

are other requisites, of course, but one taking the position of salesman and representing a line of goods (I care not in what particular line) must have a certain personality, especially if he is a stranger to the merchants he is to meet, so that he may leave the right impression.

I am one who believes, to a greater or less extent, that the qualifications to produce a good salesman must be born in him, the same as the talents of a professional man, such as a musician or actor. He must feel an interest and like his work. If he succeeds, he must leave the correct impression on his first visit; and if he fails to get an order, this impression will be lasting, and sooner or later he will succeed in doing business with the merchants he calls on.

He must at all times represent the line of goods he has just as it is, so that when the merchant receives the goods he has ordered from him, he will find them just as represented and fully up to the recommendations made by him. If he fails in this, he will never succeed in continuing business relations with any merchant to whom he misrepresents.

He must be upright, honest, and reliable in every respect, and the success of the salesman must be along these lines. He must, at the same time, be straightforward with the firm he is representing. It is a great mistake for him to become too extravagant in his expenditures. I do not believe in a salesman trying to be economical by stopping at cheap hotels, just the

reverse; for he should always endeavor to assist his business by stopping at the leading hotels; he should make the acquaintance of those who are his equal, and those representing large concerns, men who are holding high positions and demanding the highest respect of the merchants with whom they do business. In this way one salesman can often assist another.

Another very important point for the salesman representing any concern is to live up to his instructions to the letter of the law. Many houses have their own ideas as to the way their goods should be marketed, and instruct their salesmen along these lines; and the salesmen should carry out these instructions to the letter and never depart from them unless in their experience they find certain conditions can be improved by so doing, and then they should explain them to the house they represent.

His main aim should be to succeed, and not only benefit himself, but the firm he represents. He should take sufficient time to accommodate the convenience of the merchants with whom he expects to do business; not to hurry them in any way, but arrange his time to accommodate that of the buyer.

There is one thing the salesman wants to do, if possible, and that is to leave just the right impression, which is sure to give him the preference, so that when he again visits the town the merchant will await his coming, give him the orders and a preference over

other salesmen. This is a strong point, and one that will tell in the end.

I have endeavored, in a condensed form, to give you some ideas on this subject. I could go into details more fully, but believe I have said sufficient and given sufficient ground, which, if followed by any salesman, will bring success to him if he has the natural ability to make him a good and profitable salesman.

CHANDLER W. SMITH

MANAGER, WHOLESALE DEPARTMENT, HENRY F. MILLER AND SONS COMPANY, PIANO MANUFACTURERS, BOSTON, MASS.

In starting out to become a salesman one must be honest and have an honesty of purpose in order to acquire REAL SUCCESS.

That word "Success" is a broad one, and is interpreted in different ways. In order to impress the importance of this firmly upon your mind, I am going to give you an illustration:

Not long ago I was visiting a large Western city, and as I went to the hotel dining-room for my breakfast, I bought a morning paper. I was informed that it was the largest and most reliable of all the papers published in that city. Prominent, on the first page, was an obituary notice of a man who had been the managing head of an enormous corporation, and enjoyed the reputation of being one of the brightest and most able

men that our country possessed. On the editorial page of that paper I read a two-column article giving the history of his business life. The article gave him credit for his accumulation of many millions of dollars, and then criticised him right and left for his unfair and unprincipled business methods.

I believe that article voices the sentiment of every honest person who was familiar with the business career of that great financier, and it should be a warning to you and stand out prominently before you as a danger signal labeled "Failure!" It should impress upon your mind that there is something else besides the accumulation of the Almighty Dollar to constitute a truly successful business life.

You should have implicit confidence in the goods you are selling, and treat your customers as you would like to be treated in return. You should study human nature, as hardly any two customers can be handled successfully by the same method. Obtain the confidence of your customers by taking a special interest in them. Recommend to them the article that you yourself know will be the most satisfactory, and be sure that you are giving your customer full value for money received.

You should be courteous and polite at all times and under all circumstances, and if possible take more pains with your customers after the sale than before. You should never sell an article for a higher price than it is marked to be sold for, thinking that by so doing

you will gain the good will of your employers. If you do, and your employer is honest, he will insist that you refund to your defrauded customer the full amount of the over-charge, and inform you, with emphasis, that if the act is repeated it will cost you your position. I know of no truer saying than the following quotation: "First of all to thine own self be true, and it will surely follow as the night the day thou canst not then be false to any man."

You should familiarize yourself with the qualities of your competitor's goods, but never speak ill of your competitor or his goods. That custom is too often adopted, and the result is like the gun that kicks backward, does more harm to the salesman than to the competitor. You can employ every moment of the time that your customer can give you to much better advantage by explaining the merits of the goods you are selling.

Be sure your customer understands fully the conditions of the sale. If interest is to be charged, see to it that your customer fully understands that fact, the rate of interest, and when it is to be paid.

Remember that there is nothing more annoying to your employer, or harmful in fact, than to have a dissatisfied customer.

I have only submitted a few fundamental principles of salesmanship. If what I have said will be of any assistance to you, my efforts will not have been in vain.

In closing, I want to impress upon your mind that "Truth is a Divine Attribute and the Foundation of Every Virtue."

HUMPHREY O'SULLIVAN

TREASURER, O'SULLIVAN RUBBER HEEL COMPANY; PROPRIETOR, THE MERRIMACK CLOTHING, LOWELL, MASS.

You ask me how to describe the ideal salesman. The ideal salesman meets you with a glad hand, if he knows you; if he does not know you, he greets you, and while he is entertaining you in conversation he is digging through your mind, — who you are and what you want.

The ideal salesman! To be a salesman to-day means to be a gentleman first, of resourcefulness, intelligence, and tact; and, while I do not claim any of those accomplishments, I have been a salesman for over a quarter of a century and I know whereof I speak.

A salesman! In my estimation, a salesman is born and not educated. Every great success in this country represents as its head a salesman. If he were not a salesman, the firm would not be a success.

There are more salesmen in name than in fact. All that I can write upon the subject of "Salesmanship" is to tell each one who intends to be a salesman:

Throw your entire heart and ambition into the busi-

ness with which you are associated. If you cannot do that, you are simply a machine.

You must master and remember every article that is in your department. If you are "classy," and if you really understand the business that you are associated with, you will have to sell your customer the highest class of goods in your department, because of the manner in which you describe the goods and the interest you show to your customer. Cheap goods sell themselves, but it requires a salesman to sell high-class goods.

Salesmanship consists, first, in kindness, honesty, and politeness; next, in making the customer understand that the goods that you have for sale will benefit him to own them. And when I say that, it tells the whole story of salesmanship, in advertising or selling. The man, who does not carry out this plan, fails. You need to make the other fellow think, either by talk or print, that you have something that it would benefit him to own.

Selfishness! Do not tell him that you want him to get anything because you want to sell it, but tell him that he should buy it because it will benefit him to own it. The man who knows his stock, and has his heart in his business, will sell the goods; but he must not show by his action to the customer that he wants to sell, that he is hungry to sell. His cleverness will come in by making the customer believe that he ought to own what he has for sale.

DAVID M. PARRY

PRESIDENT, PARRY AUTO COMPANY, INDIANAPOLIS, IND.; EX-PRESIDENT, NATIONAL ASSOCIATION OF MANUFACTURERS OF THE UNITED STATES AND THE CARRIAGE BUILDERS' NATIONAL ASSOCIATION

There was a time, not long past, when the "drummer" was generally accepted as a common rogue. To-day he must be a gentleman in the truest sense. Then he swapped drinks and hot stories; to-day he passes out engraved cards and discusses the psychology of the trade. The problem now before him is that of a dual existence, a sort of Dr. Jekyll and Mr. Hyde life confronting him, whichever way he may turn. And, unless he is blest with the best in man's makeup, he is doomed to a double rôle, for on the one hand he protects his personal interests along with the employer's, and on the other hand he protects the customer's interests to get more business.

Now you can see how impossible it is to fill this dual position when things begin to conflict. Everybody lied whitely. The salesman made claims for his goods that were based more on eager desire than on fact. The customer begins stretching the truth from the point where the salesman left off, and in the Divine Law of Compensation gets everybody into trouble. Then it is up to the salesman to adjust affairs to the

satisfaction of the employer or he loses his job, and to the satisfaction of the customer or he obtains no more orders. And the devil laughs while our salesman flips to the advisability of jumping from the frying pan.

Right here I want to suggest the substitution of the Truthful Triangle for the Square Deal. Place the employer, the salesman, and the customer on the points of an equilateral triangle, the sides of which shall be bounded by lines of truth, and you have demonstrated the only methods business can ever follow. Turn the Truthful Triangle whichever way you will, and you have always the same proportions. The salesman knows for certain that the sides which support him, one leading from his employer, the other from his customer, are equal as respects Truth. He gives out his facts accordingly.

So our salesman must not only be a gentleman, but he must be a veracious one. His funny stories and red bottles are mildewing on the shelf where good judgment had grown so dusty. Just good, honest horse-sense is all the employer wants. My experience selling goods on the road soon taught me that before I could ever succeed I must have ability to control myself. One customer wants to take a drink with you, another a smoke; this one desires dinner at your expense; that one a theater ticket. Though the customer expects this as his due, yet the employer will not carry this extra expense, while the salesman cannot.

I soon discovered that if I avoided beginnings there

was not the continual worry. "Habit at first is but a silken thread. Beware! that thread may bind you as a chain." Habit, little by little, slyly and unperceived, slips in the foot of her authority, but having established it, she then unmasks a furious and tyrannic countenance against which we dare not raise our eyes. Providence smiles kindly on the salesman who guards himself and his employer from these impositions. You see the customer is trying to spoil our Triangle by acquiring greater length to the side he represents. And the strength of figure means, "Together we succeed, divided we fail."

Now I have piled obligations on our salesman until he is an honest gentleman of habits. He is paid money to hold down second base on the Truthful Triangle, and there we have him smiling out friendly sunshine and glowing with faith in his goods.

EDWARD W. POPE

EX-TREASURER, POPE MANUFACTURING COMPANY, "POPE-HARTFORD" AUTOMOBILES AND "COLUMBIA" BICYCLES, HARTFORD, CONN.

The question is often asked, Can a salesman be successful and always tell the truth? Some men tell the truth because it is right, and, therefore, need no advice. Others think it sometimes pays better not to tell it, and it is to the latter class that I appeal.

My experience in business of over forty years has en-

abled me to observe many instances where a business house has built up a reputation, and kept it, because it would not allow its salesmen to deceive their customers. I remember discussing the matter with a man who admitted that he deceived his customers. I asked him if he thought it paid, and he replied, "Yes, I think it does. There is a sucker born every minute, and I can find plenty of them." But he did not succeed, for his customers not only did not return, but they told their friends, and the result was that his trade dropped off and he went out of business.

Another very common mistake is to run down your competitors' goods. If you cannot speak well of them, say nothing. Many a salesman has lost his customer by doing it, as the average man believes in fair play and will favor the "under dog."

Usually a salesman must make his customer's acquaintance, and sometimes his friendship, before he can sell him; and he would certainly be very unwise to resort to deception and thereby lose all he had worked hard to gain.

Methods of doing business have changed greatly since the department stores adopted the return of goods not satisfactory. This plan made it not only unnecessary to deceive, but to do everything possible to satisfy the customer, which, of course, includes telling the exact truth. This change has affected many other kinds of business.

If a business house or corporation intended to make

all the money it could in a few years, and then go out of business, it might pay it to let its salesmen misrepresent; but, as a rule, fortunes in business take nearly a lifetime to build, and, in the long run, if not in the short one, it pays to be truthful.

If the manufacturer is truthful through his manufactured articles, of course it is easy for the salesmen to be truthful in selling them. If the manufacturer makes a dishonest article, then the salesman should not pledge himself to sell it.

It takes a long time to make a reputation for a manufactured article; it requires constant watchfulness to keep it; and it is very easy to lose it. It is just the same with a salesman's reputation.

FRANK S. CHICK

VICE-PRESIDENT, THE JOHN H. PRAY AND SONS COMPANY, WHOLESALERS AND RETAILERS OF CARPETS, BOSTON, MASS.

A salesman's best asset is knowledge of human nature.

The great salesman is an even balance of knowledge of human nature and of his business, but, of the two, the former is the more important.

Out of this equipment, and two good-sized "Don'ts," salesmen are made.

Don't talk too much; be a good listener.

Don't make mis-statements.

Of course, I presume that you are going to be polite and decent, for you have to have these to make friends with even a yellow dog. How much more are they necessary when you have something "really worth while" in hand?

I have known of successful salesmen who took a drink when they liked, and smoked in a customer's face, whether the customer smoked or not; but I have known far more who did not, and somehow or other this latter class are about longer and keep out of the graveyard.

It is about all summed up in good manners, good-nature, and good sense.

ROBERT J. MIX

MANAGER, ORDINARY DEPARTMENT, NEW YORK CITY OFFICE OF THE PRUDENTIAL INSURANCE COMPANY OF AMERICA

That the salesman should be thoroughly familiar with his wares, that he should understand human nature, that he should know when he has talked enough, that he should be neat and cleanly as to his person, — these are facts that are patent to everybody. The statements are axiomatic. Therefore, in this brief article, let us take higher ground, let us look for a moment at the moral side of "Salesmanship," for no man can be called a good salesman who achieves temporary success at the expense of the RIGHT.

It is of the utmost importance that the reader should agree with us at the outset that the ability to dispose of a large quantity of goods does not necessarily make a man a good salesman.

One who misrepresents his goods, or induces his customer to purchase under a misapprehension of the terms of the sale, is not a good salesman, no matter what the size of his orders; he's a bad salesman, and a bad salesman is not only an undesirable employee, but he is a most objectionable citizen, for he tends to undermine that which lies at the foundation of all good salesmanship and real prosperity, namely, public confidence. One salesman who has sold a bill of goods through the practice of deceit or misrepresentation of any kind makes trouble for all the good and honest salesmen who come after him.

Goods which are not sold on their merits had better never have been sold at all, for the sale is of no ultimate benefit to the concern that the salesman represents, and no business house or corporation can afford to retain in its employ what is commonly known as a "slick" salesman, one who resorts to trickery of any sort with customers.

It cannot be denied that a salesman is frequently confronted with the temptation to take advantage of the customer's ignorance, but it is a temptation which must be resisted, if the salesman expects to make healthy and lasting progress in his vocation. By adhering rigidly to the truth, he may occasionally lose

a sale; but, on the other hand, he has no chickens coming home to roost, he has no dissatisfied customers. He can look men in the face, conscious of his integrity; he will gradually, but surely, build up a reputation of the right sort, a reputation for reliability; he will be known as a man whose word is as good as his bond, and, if he is industrious, he may feel assured of success.

The salesman should be a man of smiling countenance and a kindly heart. Human nature loves sunshine, and customers like to trade with the man who wears a smile and who breathes the spirit of geniality. Is it not so with you, reader? Have you not often visited a store in which you have declined the proffered services of a number of clerks in order that you might be waited upon by a particular salesman who had won you over by his painstaking, good-natured manner, and by the apparent truthfulness of all his statements? Of course, you have, and if this is true of you, it is true of others. It is true of practically all of us.

A good salesman will never make slurring remarks about a rival concern, nor will he permit himself to sell a customer more goods than the customer needs. The man who makes either of these mistakes has done more harm than good to the house which he represents, he has done something which may result in the loss of that customer's trade for future years.

Finally, and in general, honesty in the broad sense, honesty of purpose as well as honesty in practice, is

not only the best policy for the salesman, but it is the only policy which he can follow if he expects to become a "good" salesman.

P. A. BEST

MANAGER, SELFRIDGE AND COMPANY, WHOLESALE AND RETAIL MERCHANTS, LONDON, ENGLAND

Industry. First of all you must have the desire to do well; you must bring into this business all that is best in your home training. You must be industrious, for in the ideal condition that I am imagining there is no room for idle people, and every moment that is wasted by each individual is a great loss of time and opportunity.

Honesty. You must be honest in all that you do and say, scorning to be untruthful, having far too much self-respect to be dishonest in the slightest detail. It is dishonest to take away from this store, or to use for your own purpose, without permission, the least expensive of the supplies that are from time to time provided for your various departments or sections to wrap merchandise in or for you to use in the discharge of your duties. The pen that is supplied to you is not your own property; the string that you use for tying parcels must not be used for your own purposes. All these little points help to build up scrupulously fine characters.

Perseverance. You must be persevering, and al-

though it may be difficult for you to accomplish many things that you set out to do, if they are worth accomplishing, you must not lay them aside unfinished because you are not able to surmount the difficulties as soon as you would wish. The putting off of the completion of any task is always a dangerous thing to do. Do not procrastinate, for "Procrastination is the thief of time"; but the qualifications of perseverance will help you to keep trying until finally you must succeed in doing that which you are attempting.

Thoroughness. You must be thorough: do not handle your duties in a light manner; do not be content with surface service, — *i. e.*, apparently doing the task that has been set you, — for this is not sufficient. Do it in such a way that you know it cannot be done better, — that is being thorough. If you have received instructions how to perform a certain task, endeavor to find even a better way than you have been told; — always be thinking of better ways and better means of carrying out your daily work. This is the cult of thoroughness, and will be one of the strongest factors in your business success.

Punctuality. "Punctuality is the soul of business," for the care and forethought which make you careful to be punctual are the very essentials that will carry you through other duties. If the morning is foggy, leave home that much earlier, so that you may be able to catch the train that leaves before the one you usually catch. Abhor excuses, and endeavor to be

independent of even climatic conditions, for by studying this you will be placing yourself under self-discipline, which will make the more serious tasks that you will have to face when you get older very much easier to accomplish.

Courtesy. Be courteous, for there is nothing that appeals to that which is best in us more than the courteous and kindly treatment we receive from those associated with us or with whom we come in contact. A pleasant smile, a kindly manner, will often win where sterner methods fail. It is good for each individual to cultivate this attribute, for it is one of those that in the practice brings as much gratification to those who acquire it as to those who enjoy its influence.

Cleanliness. It is hardly necessary, perhaps, to remind you that cleanliness in person and habits goes hand in hand with the characteristics that up to the present time I have enumerated as being essential to bring about an ideal condition under which to work.

Loyalty. Loyalty is the groundwork of good service, for one cannot give faithful service and discharge those obligations that every one undertakes when accepting employment, without being loyal. Do not talk about your house of business or criticise it in any manner, except you do so in the interests of the business and to those whose positions of authority enable them to accept and deal with the criticism in the manner to which it is entitled. The business demands

from you that same loyalty that you should show towards your parents' house. If you were to see in the conduct of your household any action of any individual member that was displeasing to you, you surely would not speak to your friends or neighbors and criticise this fault, you would immediately go to one of your parents and make a criticism; but to make this to those not connected in any way with your home would be an act of disloyalty. Therefore, the same applies to the business house, for this is your business home, and as long as you accept service in it, the house has a right to demand from you unswerving loyalty.

Imagination. Another characteristic which, if properly cultivated, will assist to make an ideal condition possible, is the cultivation of imagination. "Imagination sets the goal, and industry and perseverance are the stepping-stones that carry us towards it," and so set your goal as soon as you commence your business life. Do not be afraid of aiming too high, for as sure as you set your goal so will you endeavor to find ways and means of achieving the tasks that you have laid before you. Let every one look to the highest places on the management, and then let it be his daily endeavor to so conduct himself in the discharge of his duties that he may be gradually laying the foundation stones on which ultimately to build a successful business career whose final goal at least shall be the best post that the house can offer him. Imagination finds

new and better ways of doing things. If you cultivate the habit of thinking, your imagination is its nearest partner. Be constantly thinking of some new way of using the systems of the house. Try to imagine another method for charging up merchandise other than the sales-book. Who knows but that it may fall to you to revolutionize what is to-day the most important item in the transaction of any retail business, the use of the sales-book; but unless you exercise your imagination, and are constantly thinking how much better you could do things, you will not be likely to achieve this desired distinction.

Discipline. I would like to emphasize the necessity of strict discipline being maintained by all ranks, — in any organization and in any sphere whatsoever, — for not only is it necessary that discipline, which means unhesitating obedience to those in authority over us, faithfully discharging all orders and instructions received, respect of rules and regulations and strict obedience to same, but there is a discipline thrust upon us by Nature, the respect of which means health, for even with our own bodies we cannot ignore the laws of Nature which urge us to be obedient to its discipline, and whatever part of Nature we look to we find the same discipline is insisted upon, and any breach of this always brings ultimately its automatic punishment: therefore, in a business it is vitally necessary to its well-being that all members should readily maintain the chain of discipline from the highest down

to the lowest. I, myself, have never forgotten the twelve months that I was privileged to be under the discipline of the regular army in South Africa, and I can fully appreciate that without discipline an army would become a rabble, — useless for attack or defense. There is nothing unmanly in the implicit obedience that the discipline of the army insisted upon from me, because I appreciated its necessity; and so I wish you to appreciate the absolute necessity of your maintaining strictly and unhesitatingly the discipline of the house.

Personality. Personality is an influence exercised by one individual over his fellow creatures. It is difficult to define, yet it is easily felt. It is the effect upon our minds of an individuality that appeals, attracts, and exercises an indescribable influence. Let me use the life of individuals, who possess this charm of personality, who are known to you if not by sight at least by reputation, people of whom you have read if not seen. Let us take the personality of our late King: the influence that he wielded was the influence for peace. He was not aggressive; he was called by our friends in the United States the First Gentleman in Europe. He won for our Empire treaties and peaceful relations with Great Powers, that in my opinion will be before long mighty factors in retaining for us the proud possessions that we hold to-day. At a time when the French nation and ourselves were in no way on a friendly footing, King Edward went to Paris,

and, by his wonderful personality, the charm of his temperament, paved the way to what very soon afterwards became a complete and friendly understanding between the two nations.

Now think what it would mean if every one connected with our house, by the close study of these attributes that I have set forth, by honest endeavor and determination to take the fullest advantage of his opportunities to-day, were to build up each his own individual personality! We should have an organization that would indeed become a national institution.

R. A. WALKER

SALES-MANAGER, A. SHUMAN AND COMPANY, MANUFACTURERS AND RETAILERS OF CLOTHING, BOSTON, MASS.

The fatal obstacle which bars thousands of retail salesmen from advancement and large success is the deadening rut of commonplace daily habit, both physical and mental.

The man who falls into a rut, without the grit and stamina to force himself out, is surely doomed. He not only becomes machine-like in his thought and action, but eventually narrows his mental horizon until it is bounded by the closing bell and the weekly pay envelope.

Thus he entirely loses the ability even to form the

mental picture of success which must precede the actual performance.

Every retail salesman worthy of the name does certain important things:

He studies his stocks and keeps them in perfect order.

He is courteous to his customers, while using all legitimate means to make every possible sale.

He is regular in his hours and careful in all details of his work.

But these things, excellent in themselves, will never give him the high unusual success we all desire, — for if he is content with simply doing the usual things well, he is in danger of being benumbed by daily custom and of slipping into the rut of daily habit.

To keep out of the rut he must do the unusual things:

He must strive for originality.

He must suggest, if possible, improvements of methods, new arrangements of stocks and departments.

He must make all hours business hours; doing personal missionary work continually to increase his list of customers.

He must take infinite pains.

For example, — if he has definitely promised to deliver goods at a certain hour, the man who is keeping out of the rut will personally make sure that those goods leave the shipping room as promised.

There are a thousand and one differences of this

kind between the unusual man and the good routine man, and the salesman who successfully strives to lift himself above the ordinary, and to keep himself out of the rut, will reap the resulting benefit just as surely as light follows darkness.

P. V. BUNN

MANAGER, MAIL SERVICE DEPARTMENT, JOHN WANAMAKER, DEPARTMENT STORE, NEW YORK CITY

The word "Salesmanship" has been written so many times, and by so many pens, that I hesitate to comply with your request to tell you what it means to me. When I got your letter I pulled out Volume "S" of the Century Dictionary as a starter, and I was surprised to find no mention of the word in that book! On the other hand, dozens of writers have told what salesmanship is and how it may be acquired.

But the more I hear, and see, and read of salesmanship, the more I feel that *hearing*, and *seeing*, and *reading* of it will never *create* it.

Now, treatises covering the details of salesmanship are good things, but the student should remember that he can never make a salesman of himself by any instructions from the *outside* unless the real desire and determination to do so have been created *within* himself, and *by* himself, and *for* himself; and if a man has well and truly done that, he will need mighty few written rules to go by. It depends so much, — as in

most every activity in life, — on that sixth sense, that *Grasp*, which only one in ten seems to possess.

Take a counter salesman in a big store, for instance: Did you ever go to the same counter three times without knowing thereafter just which salesman you preferred to have wait on you? And yet the selected one may have seen the least service of any. But he *started right;* he was personally anxious to please you, — he was glad to see you; he had looked forward to your coming, and had prepared himself for it. He had learned more about his stock in three months than some of his mates ever would learn. And if you asked a question that he could not answer, he showed real solicitude about it; he let you feel that it was a *proper* question to ask, and he hurried to the aisleman and got the information; and you went away feeling a warm glow in your heart for the way he had treated you, and a resolve to trade with no one but him at that counter in the future. And, to-day, you would walk ten blocks out of your way to deal with that salesman.

The point I am making is this: That clerk had more *Real Salesmanship* in his cosmos, without ever having heard the word defined, than the majority of the experienced ones, even though they may have learned "by heart" all printed or written rules on the subject.

Our man started right by *longing to be a success*, and with the knowledge that the customer must be pleased, and satisfied, and gratified.

Salesmanship means the art or science of convincing another that it would be to his interest to exchange his money for whatever commodity the salesman has to sell.

The qualities that make the salesman deal with you in a way that gratifies you, all combine to make the salesman's *Personality;* that is the one word that best defines the true basis of salesmanship. But that word means so much; it means Tact, Gentleness, Sympathy, Interest, Enthusiasm, and Intelligence, all coupled with Good Business Common Sense. But if you are unfortunate enough not to have a goodly share of those qualities, you will never be a *real* salesman; in which event, if you insist on being a salesman anyway, you will have to fall back on the written rules as your sole equipment.

After we agree, then, on what must be the *basis* of success, no harm can come from studying the details of language and gesture, and certain psychological principles, which will give finish or polish where they would fail to create.

A good actor must study his "business," even after having demonstrated that he has the personality necessary to be a good actor; but the "business" alone would make him a very poor actor.

When we get into the field of these details, there are thousands of them. But the most important thing to learn is never to try to sell a thing that you do not believe in yourself, because *Sincerity* is bound to be

felt. Without it you lose your own self-respect, then your confidence, and then your success.

In the next place learn that even a crank can keep on talking, but that it is the wise man who knows when to stop.

The salesman who can so adjust himself as to be able to hang on to his "prospect" to the finish, without boring or making him mad, is bound to succeed.

GEORGE C. WARREN

PRESIDENT, WARREN BROTHERS COMPANY, CONTRACTORS OF THE "BITULITHIC PAVEMENT," BOSTON, MASS.

NOTE. — Although Mr. Warren's article appears to refer largely to the selling of pavements, it covers in reality the entire field of selling commodities to towns, cities, counties, and states, — a class of business which has assumed enormous proportions and is growing very rapidly. What Mr. Warren says about pavements applies to almost everything sold to other than business houses.

There are few commodities, the successful selling of which requires more high-class representation, more sound business judgment, and more varied qualifications than street pavements. Each customer is the whole taxpaying public of a municipality, with all the varied opinions its members hold.

The successful salesman should not only thoroughly know his own pavement but the various competitive pavements. He should have sufficient knowledge of engineering and municipal contract law to be able, as he is often required, to advise municipal engineers,

attorneys, and other officials, to the end that all proceedings shall be in strict accordance with the law and best practice.

Contrary to what the writer believes to be the popular idea on the subject, there are few lines of business in which competition is more keen and in which the salesman has a better opportunity to display his genius and exercise his mental activities. He should have a generally pleasing address and be able to converse understandingly on general topics of the day and to meet men and women in high as well as low stations in life and to be "at home" with all. He should be able to intelligently converse with the individual or address a public meeting in a manner which carries conviction with what he has to say.

All pavements have merit. Most pavements have some features in which they excel all others. All things considered, some are best for some conditions of traffic and other physical conditions, and others best for other conditions. It is a part of the essential duties of the salesman to quickly perceive the conditions and determine whether or not his pavement is most suitable for any particular case and be as frank in advising that another pavement be used if better adapted for the street as he is insistent that his pavement will give the most satisfaction under conditions for which it is best adapted. Intelligent consideration and prompt action on the part of the salesman on this important point avoids getting himself and employer committed

to undesirable propositions. Salesmen are apt to feel when they frankly acknowledge that a pavement is not best for any condition that the public and competitions will seize on that as an acknowledgment of general inferiority. In the writer's judgment and experience frankness in such, as in other matters, yields the best results in the long run.

To enable him to answer argument and intelligently answer questions, the salesman should be familiar with the merits, demerits, and history of all kinds of pavement and paving materials, and while vigorously presenting the merits of his own material, he should be careful not to exaggerate and over-state them, and equally careful to be fair to his competitors' wares. Above all, he should avoid "knocking" or unduly referring to the misfortunes of a competitor. Uniform perfection in any engineering construction is impossible, and when, as they often do, salesmen have more to say against a competitor's than about their own product, they generally create a lack of confidence in the minds of the customers, who, as a rule, do not care to hear what a salesman has to say against a competitor.

A part of the qualifications of the successful salesman is to have a general knowledge of the laws and customs in other cities and to advise what form of law and method of assessment is best and safest. It frequently happens in cities, which have not done paving before, that either the city attorney, engineer, or other official starts something irregular in the form of proceedings,

assessment, specifications, or contract, which, if consummated, would endanger the legality of the whole proceedings and contract. The salesman must know what is right and what is wrong, and then, most diplomatically, call attention to the error and advise how to correct it. He must know enough of finance to be able to intelligently advise the taxpayers and officials how to proceed, — how other cities do it.

The salesman should studiously keep out of partisan politics. He needs the friendship of all, and, even under the enticement of temporary advantage, should avoid making enemies for the future by becoming a partisan in politics.

If the salesman represents a bituminous pavement, he must know sufficient of the chemical constituents and physical properties of bitumen, both as to his own and that of his competitors, to intelligently represent his material.

The best thought in street construction of the last seventeen years (the life of patents) is generally represented by patents. If the salesman happens to represent a patented pavement, he must have a generally correct knowledge of the fundamental principles of patent law, and also of municipal law with respect to its application to patented articles in connection with the general laws regarding competition.

In many places payments to paving contractors are made in municipal bonds or assessment liens. When contracts provide for cash payment, the ability of the

municipality to meet its obligation often depends on the salability of its bonds. A first-class salesman, therefore, should have added to his other accomplishments a good knowledge of finance and real estate values and should investigate these matters to the end that he does not load his employer with a lot of unsalable securities or contracts on which he cannot realize the contract price.

As stated above, few businesses are subjected to more keen and aggressive competition than the street-paving business. This may not be so as to any particular kind of pavement, but all kinds of pavements are sharp competitors of each other. The representatives of all are keen for the business, — a condition which necessarily regulates the prices and quality of workmanship. Except in very extraordinary cases, one cannot get an exorbitant profit for his work, and if he attempts to do so he will find his competitors "on the job" with another kind of pavement, perhaps not so good but answering the same general purpose, at so much lower price that the exorbitant profit man will find himself "in the cold."

The salesman should not only be able to advise on matters referred to above leading up to the construction of pavements, including the materials to be used; laying out of the street, including lawns, parkways, shade trees, etc.; but also how to care for the pavements, — how to economically clean and repair them, after they are laid. He should be well read and up-to-

date on all matters pertaining to his and his competitor's business and able to hold his own in any public or private argument on the subject.

Finally he should be a "hail fellow well met," always sober, industrious, and economical, but not penurious in his expenses. When a salesman is noticed to be extravagant in his expenses and mode of living, the public quickly reaches the conclusion that the profits of the business must be excessive, however erroneous the conclusion may be and however difficult it may be for his employer to meet the expenses out of the revenues from the business.

F. P. SEYMOUR

SALES-MANAGER, L. E. WATERMAN COMPANY, MANUFACTURERS OF FOUNTAIN PENS, NEW YORK CITY

Advertising has lessened "the strength of the cry" from the drummer of old to the salesman of to-day. In the process of standardizing products of manufacture salesmen also have become standardized.

The successful salesman of to-day must be a well-read, forceful, honest, polished man, who can meet intelligent dealers on the basis of assisting them to increase their annual business. "Ways and means salesmen," or those with the creative force, have taken the place of the drummer, who formed his acquaintance with a dealer, supplied his merchandise at the highest price possible, shipped it into his dealer's store, and then

left him stranded to dispose of his stock to the best of his ability.

Price standardization has left little opportunity for salesmen to supply goods at more favorable prices than might be first quoted. With the purchase price and the retail selling price regulated, the margin of profit is established, as is done with the leading staple lines of to-day. The salesman's effort comes extensively to the front, then, to make the dealer's business sufficiently large to afford a desirable trade on a fixed profit.

Advertising *has* regenerated salesmanship, but has not minimized the importance of the selling department.

We look for greater changes in the era of salesmanship in the next decade than in the last.

CONTENTS

CHAPTER I

PAGE

THE COMMERCIAL STATUS OF ADVERTISING 3

Business is becoming a world-dominating science—Simplifies problem of production and distribution—fathers products of world and puts them in easy access to all —Advertising creates conditions and habits; produces demands by molding the public mind—Incomes divide people into groups—Biggest advertising successes, articles of small retail value—Reaching the right group the problem of space buyers—Advertising must appeal to right group—Finding the right group a fundamental problem—Manufacturer can create buying groups by advertising—Advertising makes possible small capital and reduced selling cost—Group department store advertising most productive—Advertising not a material substance, but service to a group.

CHAPTER II

PAGE

How Markets Benefit Both Consumer and Producer 16

The market based on the group—Professional services enhanced by the group—The group idea establishes banks—Marketing a young man's time—Price as a marketing factor—Buyer not an expert judge of intrinsic values—Disaster follows price competition—Quality and service competition beneficial—Salesman's judgment must be respected—Market control a money-making occupation—Cash lubricates the machinery of production and distribution—Publicity will correct all evils of market control—Consumers should prefer goods bearing the producer's trademark—Dangerous position of some manufacturers.

CHAPTER III

Salesmanship Is Service 28

Men succeed in the measure in which they can induce others to accept their views—Salesmanship entails permanent satisfaction to the buyer and a profitable compensation to seller—Advertising is organized salesmanship—Service dominant in

PAGE

salesmanship—The successful salesman sells merchandise plus merchandising advice and ideas—Advertising is service salesmanship directed at a group.—Advertising should create desires that benefit the consumer—The responsibility of the publisher to his subscribers—Censorship of advertising a necessary service.

CHAPTER IV

ADVERTISING IS SELLING THE GROUP . . . 38

Men with ability to induce others to accept their views, broaden their appeal to take in a group—The group idea converts storekeepers into merchants—Creates department stores—Groups analyzed in detail—One form composed of those who think alike—Groups are essentially coöperative organizations—Cities, fast trains, publications, are good examples—Luxuries, conveniences, and education made available for all because of groups—Group membership matter of volition—In reaching groups advertising multiplies salesmanship—All forms of advertising an appeal to groups—Sensing the keynote of group harmony brings success to the salesman and writer of advertisements.

CHAPTER V

PAGE

THE TOOLS OF ADVERTISING 48

Leave the detail to men whose special business it is to work with type, art work, engravings, printing, plates, etc.—Successful illustrations must tell the story in less space than could words—The idea must usually be given the artist—Simple words the best—Give the typesetting room superintendent leeway in setting printed matter—Building advertisements as much of an art as building homes—How type is used in printing newspapers and magazines—The making of engravings and importance of getting good ones—Making the most of advertising space—Space buying a job for a man of experience—How to get good printing—The postage saving expert a coming profession—Paper stocks and printing inks.

CHAPTER VI

ADVERTISING MEDIUMS 59

The group spirit creates the advertising medium—Some mediums have greater prestige than others—How to analyze the value of a medium—The service rendered by representatives of mediums—One large group

PAGE

compared with several smaller groups—The different mediums used in advertising—Newspapers the logical medium for local stores and for satisfying immediate needs—The importance as mediums of fiction magazines, national weeklies, trade, class, technical publications, and farm papers—How to judge class publications.

CHAPTER VII

ADVERTISING MEDIUMS—CONTINUED . . . 68

Street-car advertising: its function, cost, and how it is checked—The evolution of the modern 24-sheet poster—Billposting service as standardized in the United States—Painted bulletins and their value compared with walls. Electric signs, window displays, store demonstrations, sampling, house-to-house canvassing—Form letters, mailing cards, folders, printed matter used to assist salesmen—Calendars and novelties—Slides.

CHAPTER VIII

BUILDING AND TESTING AN ADVERTISEMENT. 78

What the copy writer should know—The copy writer is an interpreter between advertiser and buying groups—Writing and illustrating advertisements with a strong

PAGE

group appeal a natural gift—Diagramming the advertisement—Brevity not necessarily good—Ten tests of an advertisement: Is it institutional—is it natural—is it specific—is it timely—is it pertinent—is it consistent—is it persistent—is it authoritative—is it plausible—is it sincere?

CHAPTER IX

APPLICATION OF THE TEN TESTS 88

Application of the ten advertising tests made to the retail advertisements of such prominent institutions as John Wanamaker, Philadelphia; Marshall Field & Co., Chicago; B. Altman & Co., Rogers Peet Co., New York; Filene Brothers, Boston; Wm. Taylor & Sons, Cleveland—Comments on national magazine advertising of Eastman Kodaks, Old Dutch Cleanser, American Telephone & Telegraph Co., Swift's Premium Hams, Hydraulic Pressed Brick, National Lead, Quaker Oats, Ivory Soap, Hart, Schaffner & Marx Clothes, Sears, Roebuck & Co.—Application of ten tests to White Rock Water electric sign.

CHAPTER X

ADVERTISING AND SELLING THROUGH THE ORDINARY CHANNELS OF TRADE 107

PAGE

The retailer and his function: The wholesaler as an aid to the retailer—The exclusive jobber plan—The jobber a distributor, not a market creator—Selling the dealer direct—The third middleman: agent, broker, importer or exporter—Selling the consumer direct through agents, representatives, solicitors—Manufacturers who operate chain stores—The mail-order house—The middleman essential in almost all selling systems.

CHAPTER XI

RETAIL ADVERTISING—PREPARATION . . . 121

A stable labor market necessary to successful retailing—Crime of contributory idleness—The location within the locality—Appreciation of mental and physical conditions—Buying should be concentrated—Comparative value of advertised and unadvertised products—Exclusive agency—National prestige and local reputation—Analyze selling costs—Coöperate with national advertising.

CHAPTER XII

RETAIL ADVERTISING—METHODS AND MEDIUMS 130

Attract favorable attention—Inside store display essential—The chief improvement

PAGE

in modern business is the change from a personal to institutional business—Retailer should be able to say no—The plan more important than the medium—How suburban retailers can cash in on the manufacturers' advertising—How the retailer can remove doubts—Plan your work; work your plan.

CHAPTER XIII

RETAIL ADVERTISING—MAKING GOOD . . 139

Maintaining confidence increases the dealer's assets—Inviting the return of merchandise increased profits—"Taking back" goods the dealer did not sell—The power of service—Price cutting benefits nobody—Difference between intrinsic, real, and commercial value—Will service become too costly—Desire for luxury stimulates industry—Service competition invites cooperation—Advertising will bring needed reforms—Stable conditions insure prosperity.

CHAPTER XIV

MAIL-ORDER ADVERTISING 151

Mail-order advertising logical and natural—Over two billions worth of merchandise

PAGE

sold by mail, each year, in United States—This only one fourteenth of whole business—The wide-awake retailer need not fear mail-order competition—The field that the mail-order advertiser fills better than any one else—Many nationally advertised lines started in mail-order way—Choosing the medium for mail-order advertising—Advertising and follow up of mail-order house of high quality—Must offset the prestige and personal salesmanship of the store on the ground—Every word must be weighed in a mail-order advertisement—Headings that changed inquiry costs from $1.64 to 8 cents apiece—Getting the names of possible buyers—Advertising to focus attention of mail-order catalogues already in circulation.

CHAPTER XV

NATIONAL ADVERTISING AND EXCLUSIVE DEALERS 162

A coöperative arrangement between high-class manufacturers and high-class retailers—The manufacturer contributes selling helps, the retailer advertises locally and pushes the sale—Drawing inquiries through national advertising to refer to dealers—How magazines are protecting dealers—

PAGE

Failure to handle advertised goods a reflection on the dealer—The great variety of selling helps furnished dealers by manufacturers.

CHAPTER XVI

TRADEMARKS 170

Value to consumer—No valid reason for purchase of untrademarked goods—Bargain hunter assumes entire responsibility—Sincere dealers in untrademarked goods must come together with manufacturers of trademarked products—Trademark fixes responsibility and helps to standardize price, production and selling costs—Backing up the trademark with advertising.

CHAPTER XVII

PRESTIGE-BUILDING ADVERTISING 178

The salesman's part in establishing prestige—Prestige not inherent, but the impression conveyed—Constant reiteration driving home the fact—Telling the prestige building story—Publicity without prestige; the recoil—Advertising makes the goods live up to the prestige gained—Building prestige on a rise in price—The deciding vote—A house of cards.

CHAPTER XVIII

PAGE

COÖPERATION BETWEEN SALESMEN AND ADVERTISING 189

Salesmen, the closer; advertising the missionary—Creating the buying impulse—Team work—Increased income for the salesman—Service to consumer—The stability test of both advertising and salesmanship—The salesman with a medieval mind—The modern machinery of selling—Advertising and selling should cost no more than selling alone—Educating the retailer to coöperate—Responsibility means coöperation.

CHAPTER XIX

PRICE MAINTENANCE. 197

The business builder for the retailer—Makes mail-order business possible—The field of tremendous accomplishment—Getting the "jump"—The supreme court and the fixed price—Two effective ways of maintaining price—Cut price plays havoc with confidence—Plus service vs. cut price—Persuasion vs. Coercion—Advertising, the strongest ally of price maintenance.

CHAPTER XX

ADVERTISING OPPORTUNITIES 206

Young men who want to get into the adver-

PAGE

tising business must be cautioned that advertising is a serious business, and that a knowledge of it can be gained only by hard work and close application—The bigger opportunities in advertising are its application to ordinary everyday business life—The types of advertising men include the publisher, the solicitor who must sell, with his space, ways and means of making it profitable, the advertising writer, the space buyer and the printer, platemaker and typesetter who can become real artists at their work—Big advertising opportunities are open with the publishers—Advertising courses in universities, and things to be remembered in the quest of advertising experience.

CHAPTER XXI

THE ADVERTISING MANAGER 212

He should be synonymous with sales manager, interpreting the sales policy both to the salesmen and through printers' ink—The job is as big as the man who fills it—Four epochs in every business career—The final epoch commanding the coöperation of men of big calibre—Business should be an open book to the advertising manager—The strong advertising manager must be

PAGE

mature in development, and also to command coöperation and discriminate between the unessential things and the really big things.

CHAPTER XXII

THE ADVERTISING SOLICITOR 225

The first attempt at soliciting—Advertising can harm as well as help—A solicitor must sell service—Study the customer's proposition, his market, and show how you are ready to serve him—Things to avoid in talking with prospect—Soliciting, a serious job—Building confidence—Know your medium like a book—The value of definite statements—"Plan your work and work your plan"—Connect with a good house.

CHAPTER XXIII

THE ADVERTISING AGENCY 237

The business of soliciting, preparing, placing, checking, and paying for all the advertising space entails an infinite amount of detail. To handle this work the agency was developed—The history of the agency from the days of split commission and special rates to the present-day agents of four types—The agent who sells service to the customer, the highest type—He gets his

PAGE

compensation as a retainer fee plus a service charge for work actually handled—The four definite functions of high-class agency service are: 1, Counsel on mediums; 2, Purchase of space; 3, Copy Building; 4, Sales Coöperation—The advertising agency should be a trustee of the customer's money and advertiser should have constant access to the books.

CHAPTER XXIV

ACCOUNTING 248

The Accounting System should provide a ready basis for advertising deductions—Proper distribution of overhead expense, —How to change the advertising—The executive should be able to find out at a minute's notice anything he wants to know —Keying mail-order advertisements—Good accounting an asset in negotiating loans or receiving favors from banks—The relation of advertising to good-will—How much should be spent in advertising—Successful advertising defined.

APPENDIX 257

INTRODUCTION

Early in the spring of 1910, Dr. Willard R. Hotchkiss asked me to take an evening class in advertising at the School of Commerce which Northwestern University had just established.

In a general way, I grouped the subject matter under ten heads, one of which was covered each week in a preliminary talk. This was supplemented by an informal discussion—my answers to questions put by the students.

The chapters which follow are based upon notes made at these classroom talks, and from lectures delivered before the Universities of Chicago, Wisconsin, Michigan, Illinois, Minnesota, and Washington.

Advertising as a means of influencing human beings through groups presents its most interesting characteristics.

It is by comprehending the group spirit and working in harmony with it that the greatest achievements in advertising have been made.

If this book shall serve truthfully and adequately to introduce the reader to a profession which is fascinating, constructive, and growing, it will have fulfilled its purpose.

JOHN LEE MAHIN.

ADVERTISING—SELLING THE CONSUMER

CHAPTER I

THE COMMERCIAL STATUS OF ADVERTISING

THIS is the age of advertising. Within the memory of older men the ambitious youth was urged to enter the church or the army, to study law or the sciences. Now business is generally recognized as a world-dominating science. It is becoming more and more intricate and complex, and constantly calls for a higher grade of intelligence.

In its elemental form, commerce is little more than the hewing of wood and the drawing of water, and trading in the simple things necessary to sustain a low order of physical life. It is only when it comes to grappling with our enormous wheat, corn, and cotton crops and the products of our mines and factories that it begins to demand and give substantial rewards for brain power which can organize equipment, devise ways and means, and execute.

In its crude state war does not call forth our admiration. When it means butchery, it is hideous. It is only tolerable when it is the expression of the undivided will—the group spirit—of a nation. When it is determined and reverent resistance to wrong, it is grand. In war the master-mind is an incarnation

of the national group spirit and the expression of its purpose. Alexander, Cæsar, Napoleon, Washington, and Grant understood the laws which hold human beings together in groups.

They knew how to present their ideas to these groups—that made them leaders. They got and held the confidence of the nation and of the army. They shifted soldiers about as an expert chess-player moves his mimic warriors; they won and have held the admiration of mankind because their achievements give them clear title to it.

Understanding the Group Spirit Makes Leaders of Men

So, too, with the master-minds of commerce. The problems of production and distribution, the elimination of waste and famine, the gathering of the products of the world, and putting them where they are accessible to all—these problems call for brain power.

But to the mind that has creative ability, commerce, satisfied with ordinary profit and passively awaiting the dictum of the capricious taste of mankind, still falls far short of the ideal. Having gathered the products of industry, commerce changes their form and character, fashions them into articles specially suited for the higher needs of men and women. Then, by arousing interest, creating desire, educating taste, stimulating appetite, and developing new wants, advertising makes a stable market for them.

Commerce Supplies Demand; Advertising Creates Demand

The standard of living has been raised by this

process until it includes as necessities articles the need of which was unknown to the grandparents of the present generation.

In doing this, commerce has had the help of a power which the trader did not possess. Its skill, thought, resource, and judgment, virile energy, largeness of vision and equipment, when combined with the creative force which accomplishes things, is called advertising.

In giving orders to manufacturers for six months or a year in advance, the merchant who does not advertise makes a shrewd guess at what the public is going to want. He deals with conditions as he finds them.

Advertising Holds the Public Mind

Advertising creates conditions. It establishes stable business conditions, and upon them attains its highest development. It can solve all sorts of commercial problems, because it knows how to influence human minds in groups. It will produce active desire where none existed, or at least only a latent variety. By suggestion, advertising can create among people well-defined habits which the alert commercial mind takes advantage of in building and fostering a business.

There are people who think that the display of words and pictures in newspapers is advertising. Such individuals would probably call him a merchant who mechanically hands a cake of soap to a customer. But advertising is not merely spending money for magazine, newspaper, street-car, and outdoor space.

It is the accomplishment of definite purposes—by molding the minds of groups of people.

How to Decide Whether or Not an Article May Be Profitably Advertised

Two sharp distinctions must be made when we attempt to decide whether or not an article may be profitably advertised. Because purchased in large quantities and then manufactured (i. e., so changed in form that the identity and knowledge of the source of supply of the component parts is lost), raw materials cannot be advertised as profitably, at a large outlay, as can articles of small retail value sold in packages and capable of being used by almost every family.

Raw materials are usually bought by experts who have explored the market carefully. All that advertising can do here is to teach how the goods can be utilized to the profit of the purchaser, thereby increasing the demand; or, by constantly demonstrating the superior quality of the merchandise, either get a preference, at the same price, over competing goods, or a slight increase in profit. In selling such goods, the number of possible customers is known, and the personality of a competent salesman is usually the best form of advertising for them.

There are salesmen, however, and people who are called salesmen. The man who directs a large business in accordance with certain definite principles should see to it that his customers get the benefit of them. Some form of regular communication is recommended, in the form of printed matter, between the moving spirit of an organization and the cus-

tomer. The salesman should close sales; the missionary work usually can be done best with printers' ink.

Incomes Divide People into Groups

It is in making known and selling articles of everyday use to the average family—the smallest of the groups—that modern methods of advertising have been most successful. An able statistician claims that of the 20,689,000 families in the United States, but 6.8 per cent. have incomes exceeding $3,000 a year.* This figure includes both the proceeds of invested capital and the earnings of the entire family. When we consider how many articles can be bought only by families having an income of $3,000, and that only 6.8 per cent. of the population are possible purchasers, the problem of the advertiser is to spend his appropriation so that it will reach as nearly as possible only the class to which his goods will appeal. In such case, a class magazine of national circulation might have been less waste circulation than a local paper.

Biggest Advertising Successes Are Articles of Small Retail Value

The statistician referred to claims that 27.8 per cent. of the total number of American families live on less than $400 a year; and that 46.3 per cent. live on less than $600 a year.* It is plain, therefore, that an article which sells as freely to the family of small means as it does to the well-to-do is in less danger of being exploited in publications where there would be waste. It may also explain why the biggest

* "Mahin Advertising Data Book," 1913-14, p. 413.

advertising successes have been articles of small retail value which are within reach of the masses.

Desire to own an automobile may be implanted in the mind of a man whose annual income is less than $400. But it is not probable that, as far as this individual is concerned, the advertising which created that desire will be profitable for the advertiser. On the other hand, advertising a rag-carpet loom brings good returns in a publication read by people of small incomes, but might never get an inquiry from the readers of such magazines as *World's Work*, *Harper's*, *The Century*, and *Scribner's*.

Reaching the Right Groups the Problem of Space Buyers

There are 22,141 publications* in the United States, 58,000 street cars, and millions of square feet of billboards and dead walls. The man who can afford to advertise has plenty of opportunities to discriminate. Much training for space buying is desirable, if satisfactory results are to be had.

Too frequently advertising is viewed superficially. Very few advertising men have gone deeper into their own business than to note certain phenomena and assert that history will repeat itself. An analysis of conditions and the forces which have brought them about is seldom attempted. Such men are gamblers in every sense of the word. They speak of advertising effort as "playing the game."

Few publishers understand the value of the advertising space they produce. Too many regard it as

*"Mahin Advertising Data Book," 1913-14, p. 427.

merchandise to be sold to whomsoever comes at whatever price the market will permit. Some will make a fixed price and let the matter rest there. A very few study out the service possibilities of the space, and by systematic effort develop and maintain an advertising constituency in such harmony with the group creating and conserving characteristics of publications that advertisements become of value to the readers because they are adapted to their tastes, requirements, and conditions.

Advertising Must Attract the Right Buying Group

Advertising does not consist merely in attracting attention. It must get the attention of the right kind of people in a way which will produce sales for the article advertised. All possible knowledge of the human mind, its mysterious and subtle manifestations, the influence of affirmation, argument, color, suggestion, or an appeal to the imagination and sentiments, must enter into the deliberations of the man who plans and executes an advertising campaign.

In spite of the prevalence of mistaken ideas about advertising and its true functions, about $616,000,000 is spent for advertising each year. ("Selling Forces," Curtis Publishing Company, 1913, page 40.) Much of it is intelligently spent. The men who have made a success of advertising do not think it a matter of luck; they know that its powers are subject to certain laws. Illustration, words, and space, and the cost of them, while weighed and considered, have been subordinated to the main purpose of producing

a mental impression. The place of advertising in modern business is secure. Our merchant princes and captains of industry and distribution cannot get along without it, because advertising is to the selling of goods what modern machinery is to their manufacture.

The Dealer Not a Consumer

There is a fine distinction between the effect of advertising on the final purchaser and upon the intermediate handler of the product. The man who buys a hat to wear is not at all in the position of the man who buys it to sell again. The latter is the dealer. Strange as it may seem, the most common mistake manufacturers make is that of regarding the dealer as a consumer.

The dealer buys a hat to make a profit in selling it again. Two considerations appeal to him—price and a quality for which he can establish a permanent trade. Style is valuable to him only as it is valued by the man who buys from him. Shape, color, and trimmings are not in any sense a matter of the dealer's individual taste—if his customers have definite ideas on these subjects themselves.

Advertising Creates and Fixes Habits

The man who buys a hat to wear may think he is buying it because he has to. The habit of wearing hats is evidence of skilful advertising years ago. An independent man would wear a hood, or a scarf; or let his hair grow, and do without a hat. But other men have decided what he is to wear. He may exercise some selection as far as color, shape, and style are concerned;

but it is confined to what is placed before him. He may buy a broad-brimmed, soft hat, because he admires a certain ex-president who wears one; he may buy a hat to please a woman; or he may select one which ministers to his own vanity. In any case, his selection depends upon something which another has forced on his mind, and it is with the study, comprehension, and utilization of the things which cause such impressions that the manufacturer of hats should concern himself as soon as he has mastered the mechanical problems of his factory.

Advertising gives a manufacturer power to produce trade for the thing he is best equipped to make. It eliminates competition. It creates, forces, persuades, builds. It makes things happen. It is so many-sided that it deserves the attention of each department of every business organization. Advertising produces desire; gratified desire produces habit; and habit produces business.

It does more. It makes sales. The brainy salesman gets a larger field for usefulness and more pay when he coöperates with advertising, and while making more money for himself reduces the cost of selling which includes both personal salesmanship and advertising.

Advertising Makes Possible Small Capital and Reduced Selling Cost

The man who advertises gets along on less capital and saves on interest charges. That is because a business which advertises is produced more by creating business conditions, instead of by adapting its affairs entirely to them.

Collections can be closer, for advertising puts the purchaser in the position of *seeking* the goods.

Retailers find that advertising brings purchasers to the store earlier in the day than they would otherwise come. Rent, clerk hire, insurance, all the fixed expenses of a business, must be met before the profits are counted. A store which is rushed with customers from eleven until five has but six hours of business. Advertising bargains and special sales bring customers two and sometimes three hours earlier, without increasing the fixed expense for these hours.

Advertising has educational value also. It teaches people, before they come to the store, what they want to buy. Part of their shopping is done before they leave home.

One salesman is able to wait on more customers, thus lowering the selling cost per customer.

Many stores have acquired the confidence of large groups of people in their newspaper announcements. The taste of these regular customers is molded to a considerable degree, and the buyers for the store can get lower prices because they can place larger orders, for they *know* that the advertising of the house will create a demand for the large purchases they have made.

Group Department Store Advertising Gets Most Productive Results

The advertising manager of a large retail store, if he be shrewd, will separate his trade into several groups and influence each by advertising. A certain number want high class and exclusiveness; another class spends its sur-

plus cash for bargains, no matter what they are. He finds a best method for reaching each group. This plan makes it possible for him to counteract the errors of a too sanguine buyer and to take advantage of a manufacturer's mistakes in judgment in over-producing.

Advertising Not a Material Substance but Service to a Group

Advertising is not material substance. It is service. The true advertiser and the advertising man never forget that space is less important than service. Ideas are paramount. The purpose of an advertisement should be clear and definite. It must be kept in mind constantly during the planning and execution of the details by which it is to be effected. Space, type, words, and pictures are merely tools which the master workman uses in expressing an idea. The finished work of an advertiser is not a material substance which can be seen with eyes and touched with hands, but a definite, positive impression in the minds of possible buyers which is reflected in the voluntary purchase of the goods which the advertiser wishes to sell.

REFERENCES FOR CHAPTER I

"Modern Advertising," 1905 (D. Appleton & Company, New York), by Calkins and Halden, contains much illuminating historical matter, and was up to date in every particular when it was printed. The advance in the advertising business within nine years can be measured by reading it carefully.

"Advertising as a Business Force," 1913 (Doubleday, Page & Company, Garden City, N. Y.), is an up-to-the-minute review and compilation by Paul Terry Cherington, instructor in commercial organization in the Graduate School of Business Administration, Harvard University. It deserves careful study because it shows how present-day advertising impresses a thoughtful onlooker.

"The Science of Advertising," 1910 (Duffield & Company, New York), by Edwin Balmer, with the counsel of Thomas Balmer, is a book of illuminating analysis based on concrete experiences and established principles. It is both informative and thought stimulating.

"The Library of Advertising," seven volumes, 1911 (Cree Publishing Company, Chicago), compiled by A. P. Johnson, presents the views of sixty-four men who have made good in the various phases of advertising. As a whole, the books contain much valuable information, and will give the student food for thought for some time if he attempts to reconcile conflicting opinions.

A well-equipped advertising library would contain all the issues of *Printers' Ink* (weekly), *Advertising and Selling* (monthly), the *Mail Order Journal* (monthly), and *Standard Advertising* (monthly). These publications must be read regularly, if one is to keep up to date. They cover the field admirably. Several publications put out by special interests contain much that is interesting and valuable.

The statistics quoted in this chapter and elsewhere in this book, unless otherwise noted, are from the 1913–1914 edition of the "Mahin Advertising Data Book."

CHAPTER II

HOW MARKETS BENEFIT BOTH CONSUMER AND PRODUCER

A GRAPHIC demonstration of the value of markets is given any man who hunts big game in the Canadian wilds. His whole labor is required to transport a few miles a day himself and the supplies he brings in with him. There are no mills or factories where he can market his labor for money with which he can secure transportation at 2 cents a mile on steam railroads, or 5 cents for as many as eight miles on street cars, which are markets where transportation is offered for sale. Nor are there stores to supply clothing, nor are there hotels which market shelter and food. He has his physical strength and his brain in the woods, but he can scarcely command sustenance with them. A day's labor commands a greater variety and abundance of comforts and luxuries the nearer it is performed to highly developed markets.

The Markets Based on the Group

It is no uncommon experience for a man to find food products selling at the same price in the section where they are produced as on South Water Street in Chicago. This

is because South Water Street is a highly developed and specialized market, and fruits and vegetables flow to it as naturally as the magnetic needle points to the North Pole.

A market is nothing more or less than a group of purchasers regularly seeking the same type of goods.

Mere possession of merchandise does not create a market. There must be a group of people of similar tastes, habits, and purchasing power associated with the accumulation and display of merchandise to make the market a possibility.

The numerical strength of the group is also a most important factor in the service that the market renders to the individuals comprising it.

This argument can be developed safely in determining the value of professional services.

Professional Services Enhanced by the Group

A lawyer, physician, or architect may have unsurpassed ability, knowledge, and training, but without a group of people to appreciate and pay for his work, his capacity for service benefits neither himself nor any one else. He must find a market for what he can deliver—a group of people who think alike to the extent in which they appreciate and value his work and possess the means to purchase it from him. The larger the number in the group he serves the more expert he becomes, and the more he can charge for his services without contracting his own market to a point where his full output in time and energy is not entirely taken.

A bank is a market that sells the use of money. It does not sell money itself, but merely the service rendered by having it to use. It buys the use of other people's money by acting as custodian of it, or in some cases by paying in addition thereto a smaller rent for the money of its depositors than it charges its borrowers for the same money.

The Group Idea Establishes Banks

The larger the groups of depositors and borrowers the larger is the market, which the bank really is. Again, we find depositors that *think alike* in possessing confidence in the bank as a buyer of the use of their money, and a group of borrowers who *think alike* in preferring to rent the money they desire from a particular bank.

The market for a young man's service is larger in direct proportion to the number of employers who know he possesses the qualities they esteem in an employee. His ability to profit by his market is the measure of his ability to think accurately and by will power make his thoughts control his actions. Even if there are many other young men competing in his market, unless the number greatly exceeds the demand, and he concedes equality by joining a labor union or admitting the buyer's estimate of his value as being better than his own, he can command a premium over others who apparently can perform all the work he is capable of doing.

Marketing a Young Man's Time

It is this quality in getting others to accept one's

own estimate of value that is called Salesmanship. It differentiates the highly successful from the ordinary and mediocre. It is the only power the individual has to develop any degree of influence approaching to control in his own market.

Price as a Marketing Factor

When we view the manufacturer catering to an established market we find that price exercises a great influence. Price is not a measure of intrinsic value, but it is a decisive factor in the buyer's mind who has the choice of two products apparently of equal merit.

The wonderful economies in production due to the development of the factory system has made price an important factor in the control of markets, but price cannot affect the buyer's mind to prefer one article to another unless there is also the thought of equal quality associated with it.

The Buyer Not an Expert Judge of Intrinsic Values

It is an old saying that a woman's favors are worth the price she puts on them, and we have too many instances of most consumers being wholly ignorant of values based on cost of production to make price a determining factor unless the thought of equal quality is associated with it.

No consumer buys on the basis of intrinsic value. Sentiment, rather than logic, is the impulse in most sales of articles to the consumer. It is right that this should be so because satisfaction itself is a sentiment. The measure of value in all commercial transactions is the satisfaction to the buyer.

If a woman wants an exact duplicate of the sewing machine her mother used twenty-five years ago, she will be much better satisfied with it than one embodying all the latest improvements, unless these changes have been told to her. No matter how much better intrinsically the new machine is, the daughter must be persuaded that her mother would have preferred the modern machine to the original if she could have secured it at that time.

The wise salesman says less about the mechanical features as such and more about how much the new machine would have saved her mother's work if she had possessed it in her day. This makes the present-day purchase *satisfactory* and valuable to the buyer because it is *satisfactory*.

The purchasing power of everybody's dollar has been enormously increased by manufacturers competing with each other on a price basis. But price competition without responsibility to the consumer on the maker's part is disastrous to both.

Disaster Follows Price Competition

Price competition as a factor to control the market with full responsibility to the consumer will always be self-respecting on the part of the manufacturer, and will always be true service to the consumer.

But price competition where one manufacturer lets another make his prices for him, and he meets this condition by cheapening the quality, destroys the manufacturer's self-respect and positively injures the consumer. He greatly increases the cost

of service to the consumer. This is always done where merchandise is put out that does not come up to a quality standard.

There are no business men who defend competition based on price alone as being advantageous either to consumer or producer. The whole idea of a market is destroyed unless producer and consumer are benefited.

The competition on quality and on service enlarges the scope of the market and benefits both consumer and producer. Competition on quality and service are impossible without salesmanship. No salesman is required to move goods on a price basis, but expert salesmen are needed to educate the consumer to an appreciation of quality, and expert salesmen are equally necessary to develop and maintain service.

Quality and Service Competition Beneficial

It is the introduction of salesmanship into markets that has greatly broadened their scope and has given to those who employed it the greatest degree of influence. Hence it has almost become an axiom that the man who can make sales in the market is a much more important factor than the manufacturer who supplies the goods.

No salesman can be worthy of the name unless there is a group of satisfied customers who will accept his judgment rather than their own. The organizing and maintaining of this group constitute the whole value of the salesman, and as such he has a much better position in the market than the producer who either

The Salesman's Judgment Must Be Respected

must take any price offered or employ the services of a salesman. The ideal condition for the producer is to develop within himself the quality of getting and holding a group of buyers to whom his name is a guarantee of satisfaction.

The men who influence or control the market are the men who individually profit most by contact with it.

For instance, the Chicago Board of Trade and the New York Stock Exchange are highly developed markets for the employment of the public's savings. The men who manipulate are the real money-makers. They take toll from the farmer and the maker of securities. They charge the buyer for the privilege of buying. Yet these men unquestionably render a great service to the general public.

Market Control a Money-making Occupation

A market without control will reflect caprice, fear, and overconfidence at various times. These are all factors that retard rather than develop real service to producer and consumer.

Some years ago a prominent speculator on the Chicago Board of Trade raised the price of wheat. He had seen it being shipped out of the United States when he was sure in a few months it would be needed here to prevent a famine. His purchases arrested exports. As it was, he caught wheat which had been grown in Kansas later going East. Eventually it was shipped back to Kansas to supply flour mills operating in that State. Had he not taken control of

the market, it would have been shipped abroad, and all the unnecessary labor of transporting it back again, to say nothing of the abnormally high prices for flour that must have followed, would have prevailed.

A ready market yielding cash to any farmer increases his purchasing power. It makes his day's work command more for him than if he had to trade off his produce to the consumer who did not have cash, but only the product of his own unsupervised labor, to pay for it.

Cash Lubricates the Mochinery of Production and Distribution

Market control can injure as well as benefit, but in this case the man holding power abuses the confidence reposed in him, and must ultimately fail. Control is better than chaos, and most leaders recognize that confidence of the group is necessary to maintain their position.

A bad man anywhere—in the pulpit, on the bench, in Congress, or in business—does harm, but markets and the control of markets by men who may have no other purpose than making money benefit the public. Men who exercise power must be made to accept responsibility for their acts, and publicity will insure this being done.

Publicity Will Correct All Evils of Market Control

We fail to appreciate how dependent upon each other are producers and consumers because our markets are so large. The processes of distribution are so involved that consumer and producer seldom come in personal contact.

There is no doubt that the middleman—the man who influences and often controls the market—in many cases takes more than his service is worth. That is one of the reasons why I wrote this book, as I am going to show how much of this can be remedied.

First, the producer should feel his responsibility to the consumer, and he can never do this if he considers nothing but price.

The Welch Grape Juice Company paid $10 per ton for grapes in 1897, and $35 in 1914. They paid this increase to get better grapes produced, so they could make Welch's Grape Juice realize the highest possible standard of quality.

I know lands in Iowa that have multiplied in value because farmers were shown how to cultivate cucumbers in a way that increased their value, for which the H. J. Heinz Co. gladly paid the higher price because they could give the consumer a better standard of quality.

At the Chicago Stock Yards Armour & Company paid in 1914 nearly three times as much for live cattle as they did twenty-five years before. The railroads and the packers themselves operate on smaller margins. The farmer got the increased price. Volume explains the increased earnings in making internal economies possible.

Consumers Should Prefer Goods Bearing the Producer's Trademark

The feeling of responsibility prompts a producer to lend his name to his goods because it protects the consumer. The loyal groups of consumers created in this way constitute the finest markets in the world, because

they are controlled by the producer who created them.

Every manufacturer can measure what markets cost him by subtracting what he receives for his goods from the price the consumer pays for them.

The underwear manufacturer who gets $7 a dozen for his suits pays $5 to the men who control the market if the consumer pays $12 for them. It is possible that without raising the price to the consumer the manufacturer could exercise control in the market himself by directing how the $5 should be spent, and give increased benefits to consumer and himself and also to the distributor who will coöperate in a more economical plan of distribution.

The Dangerous Position of Some Manufacturers

When a manufacturer finds that he has no control in the market in which his goods are distributed, he is in a dangerous position, and he certainly ought to look into what salesmanship and advertising could do for him as well as his real customers—the consumers.

The consumer should and will through proper advertising welcome all efforts of producers to accept responsibility for the quality of goods and the service the consumer buys.

As I will show in later chapters, I do not advocate any radical change in market conditions, but I do know and am sure I will prove that a distributor serves himself and all with whom he comes in contact when he concentrates on distributing. And a manufacturer who fails to accept responsibility and to let

the consumer of goods know that he does accept responsibility leaves an opening for usurpers to manipulate market conditions to the detriment of producer, distributor, and consumer.

There is no doubt that the consumer and producer are greatly benefited by our system of markets. Yet no student of economics can fail to see that parasites exist in large numbers, and many methods are antiquated and much improvement could be made.

How Salesmanship and Advertising (which is Selling organized to influence Groups) will accomplish these beneficial changes will be detailed in the following chapters.

REFERENCES ON CHAPTER II

Louis D. Brandeis, arguing in 1901-1911 before the Interstate Commerce Commission against an increase in railroad rates, claimed the railroads could increase profits by cutting out useless motions. His book "Other People's Money" (Frederick A. Stokes Company, New York, 1914), is one of the most interesting studies of leadership in the creation and manipulation of groups in American business life during the past twenty years. Few readers without further investigation will accept at par all that Mr. Brandeis says. Yet his advent into public life, and the place he occupies, is worthy of attention by all students of publicity. His optimism is refreshing. He believes in the people, in their good judgment when the facts are placed before them, and in their

capacity for proper action when the reasons are impressed upon them. He expects new leaders to appear on the scene and by an appeal to the group spirit accomplish great things for the people as a whole. He affirms that power to dominate the group in America can be retained only as long as the individual members truly profit thereby.

Here is a characteristic summing up of his views on the value of markets and the effect of publicity upon them:

"Every great distributor of merchandise knows the obstacles which he had to overcome before success was attained; and the large sums that had to be invested in opening and preparing a market. Individual concerns have spent millions in wise publicity, and have ultimately reaped immense profits when the market was won. Cities must take their lessons from these great distributors. Cities must be ready to study the problem and to spend prudently for proper publicity work."

Van Antwerp's "Stock Exchange from Within" (Doubleday, Page & Co.) gives a complete explanation as to the way the control of the Stock Exchange market works toward stability and public advantage.

CHAPTER III

SALESMANSHIP IS SERVICE

TO EVERY human being comes the opportunity and the responsibility for salesmanship.

None of us can achieve success without the coöperation of others.

The successful parent does not say to his child, "Never do that again!" with the added inference, "because I say that you must not." Instead, the wise father tells his ideas and ideals to his child, thereby getting intelligent and enthusiastic coöperation from him.

That man will be a failure surely who will not make the effort necessary to get others to accept his views about matters on which he needs their help.

Men Succeed as They Are Able to Induce Others to Accept Their Views

None of us can be absolutely independent. To be able to get others to accept your ideas about something which benefits you (and fair play demands that you share this benefit with them) is the essence of salesmanship.

Ability and ability to sell it = success. Salesmanship is the power of persuading others to accept you at your own estimate, the estimate upon which you

can continue to "make good." This is as precise a definition of salesmanship as I am able to frame. As applied to merchandise, it needs only a change of terms, not of essence.

Salesmanship is persuading your man to buy what you have to sell at a price which means permanent satisfaction to him and a profitable compensation for you.

Advertising Is Organized Salesmanship

Advertising is organized salesmanship. As the modern shoe factory has supplanted the cobbler, so the use of words, pictures, type, printing plates, paper, and printers' ink have given to salesmanship an impetus, a scope, and a dominion which it could never have had otherwise.

Any one who has the selling instinct and a reasonable amount of experience can increase the value of his own service and that of the goods he handles by just the amount of time, thought, and energy which he puts into selling them.

The Most Successful Salesman Is He Who Gives His Customer the Most Service

To many men the word "selling" means unnecessary inflation of prices, an added tax upon the consumer, and taking advantage of the ignorance of buyers. The trend of modern sales development, however, is to give to the buyer more and more actual service. The only salesman who may feel safely entrenched is the one who makes sure that everything he does counts in service to the consumer. By adapting his merchandise to the needs of

his trade, he can easily build for himself a substantial following. If he will study their individuality, he can influence the mental attitude of the prospective purchasers with regard to the articles which make up his employer's stock. Unless he can do this, unless he can create for himself a clientele which will come back to him again and again, his employer cannot afford to keep him.

Obviously the state of mind of the purchaser is a weighty factor in determining the value of the article he buys. For example—the intrinsic worth of millinery does not change at all from year to year; but its value fluctuates constantly, because fashion, which is the mental attitude of the buying group, changes.

The Intelligent Salesman Appreciates That His Responsibility Does Not End with the Sale

A certain salesman sells you a hat, a suit of clothes, or a piece of furniture in such a way that it affords you a great deal more satisfaction than would the same article bought from another salesman. Some who pretend to be salesmen lose sales because they do not know how to present to the prospective purchaser the merits of their wares. The intelligent salesman knows that we all buy things because the possession of them gives us a definite kind of satisfaction; he knows, too, that lacking a convinced state of mind with reference to the article purchased there can be no satisfaction.

The salesman's opportunity to give the customer actual service becomes more apparent when we con-

sider the selling of a kitchen range, a sewing machine, or an automobile. Here he has a chance to demonstrate to the prospective purchaser that the construction and method of operation of the range, sewing machine, or automobile will give him economical and adequate service. In the last analysis, the man who buys an automobile buys so many hours of pleasurable transportation, or so many miles of dependable locomotion. It is certain that the salesman who acquaints the buyer with all those points which enable him to use his automobile to the best advantage increases its life and materially decreases the cost per hour or per mile of the service he gets.

The Service That Merchants Give More Attractive Than the Goods

The traveling salesman who calls on dealers eventually becomes a competent counsellor on merchandising, financing, and trade-building. One sees why a dealer might pay such a man more for merchandise than he would pay elsewhere, and still be better off both in the matter of aggregate sales and profits, and more permanent business.

Merchandise Plus Advice and Ideas More Valuable Than Merchandise Alone

The salesman has made himself indispensable who knows he *earns*, in positive service to the buyer, every cent he receives from his employer. He will never be laid off. Every salesman who aspires to be something more than a necessary link between buyer and seller must realize that his salary and expenses are included in every sale he makes, and

that he is either a burden or a benefit to the consumer.

The clerk who renders the buyer definite service, and has this clearly in mind has taken the first step toward something better. Once the elements of his own service to the buyer are clearly outlined, he is fired with ambition to do just such work for more buyers, more than he can wait upon personally. This means that he soon needs assistants to whom he may delegate a share of his duties.

To such men advertising appeals. They see its relationship to modern business methods.

Advertising Is Service Salesmanship Directed at a Group

Advertising is systematized selling. Prospective purchasers are influenced in a wholesale group. They may not be aware that they are being reached and influenced in a wholesale way and that the force which is changing their mental attitude is accomplishing similar results with many others at the same time. In fact, the chances are, if the advertising has been properly planned, that each individual will think he has been singled out for special attention; or, better still, that he has, without outside suggestion, made up his mind to do this certain thing.

Advertising Should Create Desires That Benefit the Consumer

The best salesman uses suggestion in his work. He strives to leave with the purchaser the impression that the article has been bought voluntarily, rather than that he has been persuaded to buy. He uses advertising in the same way. He values his self-

respect (the one complete satisfaction), and will direct his powers only along lines which will benefit the final purchaser.

This does not mean that salesmanship and advertising cannot be, or have not been, used by men who did not have the best interests of their fellowmen at heart. But it does mean that the man who analyzes his work, who studies his opportunities, who desires to attain for himself the best satisfactions, and to keep his self-respect will use his ability to sell, and the multiplying power which advertising lends, for the good of all with whom he comes in contact.

Publishers Fast Realizing Their Responsibility to Readers

Men who have studied newspaper and magazine advertising for the past twenty-five years note with great satisfaction the constantly increasing number of publishers who realize that advertising should serve rather than exploit the subscriber. Advertising space was originally a by-product of the publishing business. The publisher looked primarily to the subscriber, and was concerned (1) with organizing a group of people who would take regularly and pay for his publication, (2) with collecting, writing, and illustrating the reading matter to be used, and (3) with the mechanical, financial, and executive problems incident to buying paper, putting the reading matter into type, turning the presses, and distributing the publications produced thereon.

For many years advertising remained a mystery

to publishers. They knew there were people ready to buy space. But most of them were convinced (since the reader knows that reading and advertising matter are two separate things, the publisher being responsible for the former, and the advertiser for the latter) that whenever the advertiser's name appeared beneath his copy, they (the publishers) had no responsibility to the subscriber.

The Days of Advertising "Mystery" and Fake Advertising Fast Passing

This condition was a loophole through which the unscrupulous preyed upon and exploited the reader. All sorts of fake medical, disastrous financial, and unreliable merchandising schemes were put upon the market, and paid—in dollars and cents—because their authors possessed a shrewd knowledge of human nature, and ability to write profitable advertising copy.

The general magazines are given credit for being the first to "clean up." But I know newspaper publishers, in both large and small cities, who for nearly half a century have refused to carry in their advertising columns the announcement of any business in which they would not be willing to engage.

Publishers and advertisers are recognizing that the complete confidence of the subscriber is the one sure foundation on which to build a successful magazine, newspaper, or class publication. Anything which weakens it reduces the publisher's capital. The reader may not be aware that his confidence has increased or diminished. But it is certain that dependable, trust-

Censorship of Advertising a Necessary Service

worthy news, editorial and advertising announcements, add to that confidence slowly but constantly, and that unreliability cuts it down rapidly.

Of late even the announcements of businesses which are thoroughly reliable are censored, to make certain that they contain nothing which in any wise reflects upon their competitors. Publishers take the stand that the buyer's confidence in advertising as a whole cannot be held if one advertiser is allowed to discredit another.

This is a very encouraging development of the service idea, a most satisfactory indication that during the coming twenty-five years advertising is to be a much more important factor in reducing the cost of production and distribution, and in raising the standard of merchandise and human service, than it has been during the last quarter of a century.

REFERENCES ON CHAPTER III

A book that supplements this chapter admirably is Walter D. Moody's "Men Who Sell Things," 1907 (A. C. McClurg & Company, Chicago). It is inspiring and informative, practical.

In "Influencing Men in Business," 1911 (The Ronald Press Company, New York), Professor Walter Dill Scott, of Northwestern University, presents the results of scientific tests which bear out the conclusions reached by experienced and thoughtful salesmen. Professor Scott has written several other books. All of them deal with his methods of testing the laws

of mental action in his laboratory, and the results he has observed. All are worth careful study.

Mr. A. F. Sheldon has written much and thoughtfully about salesmanship. He has made a sincere effort to segregate the various elements which produce successful sales, and to explain the laws which govern them. Practically all he has written is embodied in a correspondence course (The Sheldon School, Chicago), which one is required to take in order to secure his text-books.

Mr. Sheldon claims every sale takes place in the buyer's mind, and the processes through which his mind passes and which the successful salesman intelligently stimulates are (1) Attention, (2) Interest, (3) Desire, (4) Conviction. Conviction automatically arouses the buying impulse to action, forcing the lips to say the words and the hands to open the purse strings and thus complete the sale. Mr. Sheldon edits the *Business Philosopher* (Chicago), a monthly magazine.

In a two-volume work, "Principles of Economics," 1912 (The Macmillan Company, New York, F. W. Taussig), Henry Lee, Professor of Economics in Harvard University, has defined the creative power of salesmanship in the clearest and most satisfactory manner (page 22, Vol. 1): "All those whose labors satisfy wants—all those who bring about satisfaction or utilities—are to be reckoned as taking part in production, and are to be called productive laborers. . . . So long as a person who buys a

thing or pays for a service really *desires* it, the labor which yields him the satisfaction is productive." These two volumes, in clear and concise English, are very easily read and will help you tremendously in clarifying your own convictions. Professor Taussig understands the group spirit, because he says (page 30, Vol. 1): "It is strictly true that the workers in a modern society combine in bringing about a joint output; but the consciousness of coöperation is lost."

CHAPTER IV

ADVERTISING IS SELLING THE GROUP

GRANTED that a salesman is one who can get other people to accept his estimate of the value of the article he offers for sale (his valuation to include the value of the article itself plus the value of his service to the customer), how long do you think he will be content to appeal to only one buyer at a time? Certainly the moment he becomes aware of his ability he will want to accomplish results in a larger and broader way.

Salesmanship Converts Storekeepers into Merchants

The distinction between a merchant and a storekeeper depends entirely upon the degree of salesmanship possessed by the former. Theoretically both handle goods for which there exists a buying demand, in a location which is convenient for the purchaser. A storekeeper becomes a merchant when he puts personality into his work and gathers about him a group of people who, consciously or unconsciously, accept as valuable his endorsement or recommendation of what he offers them. Sometimes a certain store draws trade long distances past shops where equally desirable merchandise is to be had for prac-

tically the same or even less money. That is because the purchaser is definitely influenced by the prestige of the merchant with whom he is accustomed to deal.

Getting the Confidence of a Group Is the Department Store Idea

A striking illustration of this fact was afforded me one day in Detroit. I noticed that next door to a cut-rate drug store was the drug section of a large department store. In the latter I approached a saleswoman who appeared to be of about average intelligence. I made a small purchase, and then asked her the price of Mennen's Talcum Powder.

"Eighteen cents."

"What," I ventured, "would you say if I should tell you that I can buy a box next door for 12 cents?"

"That often happens. Our manager has told us to tell people that we don't know anything about the goods that are sold next door. We guarantee our Mennen's to be the genuine article, and a lady told me, a few days ago, that she wasn't going to buy any more of that cheap Mennen's, for she had used some on her baby and it had broken out with a rash, and that hereafter she will buy goods where she *knows* they are genuine."

This is an extreme case. But it points out clearly that a department store is fundamentally and essentially the group of human beings whose confidence that store has won and is able to hold.

We are all fortunate in being members of many social groups. Membership in the family group is

economically of inestimable value, and procures for us one of our most lasting satisfactions. As a rule we are not conscious that we belong to groups. We have never thought about it. We are Democrats or Republicans, Protestants or Catholics, we are literary or athletic, we go in for opera or the "movies," but quite without thinking of it as a group activity.

The Group Is Composed of Those Who Think Alike

We enjoy being with and coöperating with those who think as we do. But unless we take an active part in the administration of their affairs, we benefit by membership in clubs, churches, and other groups chiefly in that it relieves us of doing our thinking ourselves.

Some philosophers, Le Bon and Nietzsche, for example, are of the opinion that human beings lose in individuality by herding in groups. Nietzsche believed that it is impossible for two or more human beings to agree, unless one of them dominates the thought of the others. Le Bon outlines the process of influencing crowds as affirmation, repetition, and contagion. Neither one of these men sufficiently emphasizes the thought that we may enter or leave a group as we please.

Groups as Viewed by Philosophers

The man who does not interest himself in the affairs which concern the welfare of the city in which he lives misses much of the pleasure of being a citizen. Nor can he give his city the benefit of his ideas for its betterment until he can secure the coöperation of his fellow-citizens. He cannot truly enjoy the fruits of coöpera-

Groups Are Really Co-operative Organizations

tion unless he be a member of the coöperating organizations.

Every man should find in his own business enough to absorb the bulk of his time and creative energy. By regarding himself with relation to his own business as the trustee of a group of coöperative buyers, he can offer each member of the group better values at less individual outlay than would be called for should they buy individually.

A trip into the wilds illustrates my point admirably. Practically all your strength and energy is expended in transporting yourself and your belongings from place to place; a little thought brings home the advantages of the coöperation which we practise (largely unconsciously) in every phase of life.

A large city is a concrete example of what the group idea, raised to the n^{th} power, is worth. Our transportation facilities are natural evolutions of the coöperative spirit. Twenty-hour trains between Chicago and New York are a fact because railroad officials *know* that each day in the year a certain number of men can be depended upon to practically charter a special train for the trip. Each passenger has the same physical comforts, luxuries, and speed that a special train could give him—*plus* a substantial saving on his ticket. Such trains are the highest development, at present, of coöperative service in steam transportation.

Cities, Fast Trains, Publications, Good Examples of the Group

Magazines, newspapers, and class publications

offer the members of their groups definite savings. A technical engineering journal gathers and gives out to a large group of individuals who can make effective use of it information which has been brought together by many individuals at a cost which would be prohibitive for any one member of the group.

Several farm papers keep scientific specialists at work on experiments, the results of which have largely increased the yield per acre and have decreased the cost of farming.

A daily newspaper delivers to one's home, for one cent, a complete canvass of the world by cable and telegraph, plus the local field, which is covered by many capable men. No one person, no matter how large his income, could afford to duplicate this information individually for his own pleasure or use.

Conveniences, Luxuries, and Education Made Available for All Because of Groups

Magazines have fostered a general appreciation of art and have increased the ability of artists by giving them a market for their product. A similar statement might be made with regard to the writing of books. The average of culture and refinement has been materially raised, and men have been developed to cater to those new wants.

The pulling force of the group idea is that membership in any one of the many groups of which our modern civilization is made up is, in practically all cases, purely a matter of volition. No man need belong to the liquor-drinking or to the

tobacco-consuming group unless he wishes. He may also withdraw from either group at will. Yet the business of fulfilling the desires of these two groups represents an annual expenditure of $1,800,000,000 and $850,000,000 respectively. Another group makes it possible for publishers to do a $190,000,000 business in books and papers each year.

Membership in Any Group Largely a Matter of Volition

The coffee group drinks $300,000,000 annually. The butter group buys $694,000,000 worth of butter, which is more than twice the amount spent for bread, which aggregates $300,000,000. I mention the bread group as more likely to be considered compulsory. Statistics show that the total expenditure for what are considered necessities is very small in comparison with that which is paid for luxuries.

The Tremendous Proportions of Certain Groups

It is when the salesman realizes how small a part his personal sales are of the total consumption of the products he sells that he begins to see what advertising may mean to him. No matter how many assistants he may have, nor how he may organize and systematize their work, to call personally on the number of people whom he could persuade to prefer his product to that offered by others would be impossible. Realizing how little is needed to determine a preference in the purchaser's mind, he calls on advertising to help him develop a demand for the article he has to sell.

In Reaching Groups Advertising Multiplies Salesmanship

The far-seeing salesman realizes that the best way to go through a forest is to follow a blazed trail. He knows that human beings have been grouped in many different ways; he believes a group can be formed for his product.

Outdoor, Street-car, and Publication Advertising —An Appeal to a Group

If the citizens of a small town call at the postoffice every day for their mail, they have that much in common and constitute a group to which the salesman can best appeal from a location near the postoffice. If there is a public square in the centre of town, or any other place at which people have the habit of congregating, the value of a sign there is directly affected by the numerical strength of the group and by the purchasing power of its individual members.

A street car is essentially a coöperative unit contributing five cents a traveler for transportation which must otherwise cost many times that amount. Lacking the group of customers, there would be no street car. Therefore, the street-car card appeals directly to the group spirit.

A newspaper or magazine is an impossibility unless a well-organized group awaits with constant interest the knowledge which it is accustomed to receive through this particular channel.

An advertisement in a magazine or a newspaper is effective in direct proportion to the degree to which it senses and touches the group idea which makes the publications possible.

Sensing the Keynote of Group Harmony Brings Success to the Salesman and Writer of Advertisements

It has been said that the success of the late Ira D. Sankey was due to the fact that he took advantage of a universal group characteristic, sensitiveness to melody, and strengthened the appeal by using in the wording of his hymns the vernacular of the particular group to which Mr. Moody wished to present the Gospel truths. The "Ninety and Nine" was specifically directed at sheep-raisers. "Pull for the Shore, Boys!" aimed to get and hold the attention of the citizens of a fishing village.

In like manner the master salesman uses the trained writer of advertising copy and that particular medium which has acknowledged prestige with the group to be reached, to sweep away the barrier which ignorance, prejudice, and indifference have placed between him and a larger market for his wares.

REFERENCES ON CHAPTER IV

For supplementary reading, "The Crowd" (The Macmillan Company, New York), by Gustave Le Bon, and "Crowds," 1913 (Doubleday, Page & Company, Garden City, N. Y.), by Gerald Stanley Lee, are delightfully interesting. Both deal with the group spirit as exemplified in everyday life. Le Bon says groups are dominated by affirmation, repetition, and contagion.

H. L. Mencken's "The Philosophy of Frederich Nietzsche," 1913 (Luce & Company, Boston), is a digest of the great philosopher's views. Nietzsche

held that "Will to Power," which is identical with Schopenhauer's "Will to Live," is the first law of Nature. Nietzsche championed individuality, and contrasted it unfavorably with the herd idea which he condemned as being the means whereby the unworthy are able to impose their will upon their superiors. His views are interesting because unusual.

Maeterlink's "The Life of the Bee," 1912 (Dodd-Mead Co., New York), is a model for every advertising writer. It treats a thoroughly technical subject in a completely informing manner and in a fascinating style. The power of the group spirit expressed in orderly and systematic activity of apparently unconsequential individuals to accomplish really great tasks has never been more graphically described.

Woodrow Wilson's "History of the American People" is a masterly presentation of how ideas dominating the actions of many separate groups of colonists have finally been blended into a national spirit which, in its group-cementing character, makes the American nation what it is to-day. (Harper & Bros., New York, 5 vols., 1911.)

For keeping you alive to the necessity of individual action if you are to dominate your group, for developing individuality which will coöperate with and be benefited by association with others in the group spirit, for making it possible for you to share

the benefits of coöperation, I recommend the essays of Ralph Waldo Emerson. He is the fountainhead of "ginger talks" and optimism, of plans for meeting conditions as they are and making the best of them.

CHAPTER V

THE TOOLS OF ADVERTISING

MANY books have been written on the technique of advertising as a trade, so complex is it. They deal with type faces, sticks and rules, lumbago and electric baths, copper and zinc plates, acid baths, matrices, ink-rollers and presses, paste-pots and scissors, paint cans and brushes, wires and batteries; for these are the tools of the typesetter, the electrotyper, the artist, the engraver, the stereotyper, the pressman, the writer and editor, the sign painter, billposter, and electric-sign men. But I shall not attempt to explain those trades, either technically or mechanically. A man who would master any one of them should study all the literature available on the subject and serve a reasonable period of apprenticeship.

As an advertiser, an advertising manager, an advertising solicitor, or as a writer of advertising copy, he will do better to coöperate with men who specialize in the various phases of advertising, instead of attempting to oversee the details of work which must be well done from a technical standpoint, if he is to get the best results.

A few thoughts are pertinent here, however, which cannot be too frequently emphasized.

Illustrations are always desirable if they tell the story in less space than words could do it, for they have a wider range of appeal and do not need to be translated from one language to another.

Successful Illustrations Must Tell the Story in Less Space Than Words

To give a commercial artist free rein in the matter of illustration is a mistake. He should be used primarily as an artisan, to put into concrete form the ideas which the advertiser wishes to project upon the consciousness of the group. There are very few artists whose knowledge of the habits of buying groups is such that they can really contribute anything to the idea which is to go into the advertisement. Not many of them are good judges of relative commercial values.

Ideas That Appeal to the Buying Group Must Usually Be Given to the Artist

Where arbitrary spaces are to be filled with a combination of illustration and text matter, it is quite essential that just the right proportion of it, and no more, be allotted to the drawing. Fortunately for the advertising man (who is not an artist), the commercial artists can be referred, for master work of this kind, to many of the splendid frescoes of Raphael and Michael Angelo, who filled in arbitrary spaces as if they had been specially made for the pictures they placed therein.

Mechanical Limitations Must Never Be Overlooked

A commercial artist who can get around and over the obstacles which rise on every hand in reaching

the group is a rare one indeed and well worth the almost fabulous sums which he can command for his services.

Words, at best, are but symbols of ideas. Their value depends entirely upon the stage of development of the group spirit. Unless a large group had been taught that an arbitrary assemblage of certain letters of the alphabet transmits from one mind to another the idea which has previously been associated with this word, communication through the printed page would be impossible. For a foundation, then, we must have the group spirit. And the idea associated with any certain word must, as far as is possible, be kept the same.

Using Words to Convey Ideas

In advertising in the United States, it is always best to use Anglo-Saxon words, because more people understand them than those which are of Latin, Greek, or other derivation. Writers of effective advertising copy never cultivate what is called "style." They use words only to transmit an idea effectively, without diverting attention from the message itself. That is why pretty pictures and high-flown phrases often defeat the purposes of the advertiser.

Keep the Words Simple

Type, while wholly mechanical, permits of great variety of effects if skilfully handled. Many advertising men make accurate layouts, specifying the sizes and faces of type they wish used. This can be done quite easily by remembering

The Successful Use of Type

that all type is now made according to the point system, i. e., seventy-two points to an inch. Twelve-point type occupies exactly one-sixth of an inch. Most newspaper columns are two and one-sixth inches wide.*

Let the Master Compositor Work Out Details of Layout

In making layouts for advertising, the best plan is to indicate roughly all words and phrases which are to be displayed prominently, leaving to the good judgment of a thoroughly skilful and experienced superintendent of the type-setting room the selection of the best compositor for the particular work in hand. It is manifestly wiser for the man who cannot get such coöperation to make an accurate layout. This is merely a matter of careful measurement and correct arithmetic.

Building an Advertisement Likened to Building a House

It is possible for a man versed in the legibility of type faces to reset an advertisement which has a crowded and confused look (and is therefore repellent rather than attractive) in from 10 to 25 per cent. less space, and still have the advertisement appear larger than before. The architect who builds an apartment on a twenty-foot city lot, when compared with the old-time carpenter-contractor who "saved you money by drawing the plans himself," is an illustration of my point. When advertising space costs as much as $112 an inch, the economy of employing the

*"Mahin Advertising Data Book" lists the most serviceable faces of type and shows the number of capital and lower case letters which can be put in a line two and one-sixth inches wide.

most skilful manipulator of type faces is at once apparent.

Type faces stand very little wear. It is practicable to print direct from them only on small press runs.

How Type Is Used in Printing a Newspaper

None of the larger daily newspapers print direct from type. Their big perfecting presses require continuous rolls of paper and cylindrical printing plates, which are made as follows: type set up the size of the page is locked in a form; alternate sheets of tissue and blotting paper, with paste between each, are spread over it; and it is subjected to pressure under great heat. This dries the paper impression, which is called a matrix. The matrix is put in the bottom of a semicircular mold, and type metal is poured over it. In a few seconds the metal hardens, is taken out of the mold, and clamped on the cylinders of the printing presses, which turn out papers at the rate of 20,000 or more per hour per press. The heat necessary to make a matrix injures the type by expanding it; so those who advertise in a large way in many publications and want the best effects insist on having electrotypes.

The printing of books and high-class magazines and catalogues is quite different. Flat-bed presses are used and the whole type page is usually electrotyped. To make an electrotype, a wax impression is taken of the page, which may contain both type and illustration. This wax impression is dusted with plumbago, and put

How Type Is Used in Printing a Magazine

in a bath. An electric battery deposits a small sheet of copper on the face of it. A good electrotype requires a bath of from four to six hours. This shell is backed up with stereotyping metal and a printing plate made of it. A poor electrotype generally has an insufficient shell, which will not stand a long run, and is easily damaged.

The Making of Engravings

Drawings are changed into printing plates either by the zinc etching or the half-tone process. Wood engravings are practically obsolete. Half-tones and zinc etchings can be electrotyped, but with half-tones it is wiser to use the original plate and duplicate the same. An electrotype of a zinc etching is generally better than an original zinc. An electrotype can be re-electrotyped indefinitely, but each reproduction sacrifices something in printing quality. Men who are familiar with this fact can easily pick out a cheap electrotype or a reproduction from an electrotype. It shows up in the finished result, and is one of those savings which should not be countenanced.

Cheap Engravings Are Poor Economy

Nothing will demonstrate to the average advertiser the fact that the best engraving and plate-making house is none too good for his purpose, and that no money is saved by getting cheap work so well as a trip through a well-conducted shop, where he can see for himself how many processes there are where the least lack of knowledge, or of attention, would affect the finished result.

Printing plates and types are used in advertising in just two ways: (1) in space in newspapers, magazines, or class publications, such as trade, agricultural and technical papers, street-car cards, and posters, and (2) in specially printed matter, such as circulars, booklets, catalogues, and follow-up material.

Making the Most of Advertising Space

The blank space upon which printing is done may well be called one of the tools of trade. In considering how to get the best results, one must remember the size of the space available, the quality of paper, and the general appearance of the advertisements which will compete with it for attention, so that distinction may be secured either by emphasis or contrast.

Space Buying a Job for a Man of Long Experience

Space buying should be delegated to a man who has had years of experience in that work. You can be assured, when a publisher's rate-card shows a complicated list of discounts, that there is a minimum rate, and always a way by which the trained buyer, who knows how to present his proposition, can get an approximation of it.

In buying space, plates, art work, or printing, three things should be considered: (1) the cost of raw materials which will produce the right quality; (2) cost of supervision required to get the best results with the materials and the machinery used; and (3) the cost of expert help, getting the benefit of the experience of experts who have made a life study of that particular line of work. Their coöperation

is valuable and cannot be assured by always buying from the lowest bidder.

How to Get Good Printing

A printer who will coöperate with you in a sympathetic and intelligent way, understanding the purpose of your printed matter, will save you many times the difference between his higher price and that of the cheap printer who seeks your patronage through competitive bids. If you will frankly state to a competent and trustworthy printer the outside figure you can spend for a specific piece of printed matter, he can save you money in many ways.

For example, presses and paper of a certain size work best together. The big item in printing is the press work and paper. With rapidly moving presses, unless the distribution of the ink and the handling of wet sheets, after they are printed, is carefully watched, the result will be unsatisfactory.

Sometimes a catalogue just exceeds the postage limit, and has to have an extra stamp on it. A printer who is accustomed to working with the advertiser would have foreseen this, and would first have made a dummy, on specially selected paper, so that the full amount which Uncle Sam will carry for a specified sum will go into the book itself. The few cents needed for a better quality of paper, which weighs less, would mean a large saving.

"Look Before You Leap in Ordering Printed Matter"

If a postage expert should make a careful analysis

of the amount of money spent for postage during the year by some of the large and some of the small commercial houses, no doubt millions of dollars' worth of waste would be discovered. The postage expert is an unheard-of factor in business as yet, but the future holds out splendid prospects for such a profession.

The Postage-saving Expert a Coming Profession

Much might be said about various qualities of paper stock and printing inks, and about the rules for contrasting and combining colors. Whole books deal comprehensively with these subjects. Trade papers are continually publishing elaborate treatises on paper stock and color printing.

Paper Stock and Printing Inks

Just in this wealth of information and argument lies a danger for the advertiser. He may be led off into the by-paths of advertising procedure, into investigations and discussion which may be pleasurable and interesting, but which has little to do with effective merchandising and distribution.

The general rule for the use of words applies also to paper stock and colors: the consumer's attention must be gained, but without his being so fully taken up with the manner of expression that the advertiser's story is minimized or lost. This is the danger in using striking effects. There is fierce competition for the advertiser's money, and in making any decision he should keep this test uppermost: Is this the tool which will most adequately interpret my thought?

Judge Paper Stock and Inks by This Test —Does It Emphasize Itself in the Story

Greatest of All Advertising Tools Are Brains and Common Sense

Brains and common sense in seeking the reason for the rule rather than following the letter of the law, might be listed among the tools of advertising. They are as essential to satisfactory advertising service as they are to any other kind of service—no more and no less.

REFERENCES ON CHAPTER V

The newest and most effective tools of advertising are graphically and intelligently described in the printing-trade papers: *The American Printer* (New York), *The Printing Art* (Cambridge, Mass.), and the *Inland Printer* (Chicago).

Theodore Low De Vinne has published two books, "Plain Printing Types," 1900, and "Correct Composition," 1901 (The Century Company, New York), which should be in every advertising library.

A particularly delightful and inspiring book is "Printing in Relation to Graphic Art," 1903 (The Imperial Press, Cleveland), by George French.

There are many technical books on the various phases of plate-making and printing, most of which are advertised in the trade papers.

Frank Alvah Parsons' "Principles of Advertising Arrangement," 1912 (the Advertising Men's League of New York City), contains valuable information for those interested in the different phases of advertising display. The book is a series of ten lectures which treat in a technical manner the most important

factors to be considered in building a successful advertisement. Two chapters devoted to "The Use and Abuse of Decoration and Ornament" are particularly worth while.

Harry M. Basford has written a valuable book, "How to Estimate on Printing," 1913 (Oswald Publishing Company, New York). Good printers, like good lawyers and good doctors, are willing to tell their customers all they want to know. A reader will have more respect for good printers and the work they do after he reads Mr. Basford's book.

The "Graphic Arts and Crafts Year Book" (Graphic Arts Press, Hamilton, Ohio) contains the latest examples of color and process printing of all kinds on every variety of paper stock. Invaluable to printers.

CHAPTER VI

ADVERTISING MEDIUMS

THE group spirit creates the advertising medium. To think alike, people must continually receive through the same channel new impressions of ideas which in themselves may be old or new. Leaders of groups find that advertising is the most competent means of getting their ideas into the group consciousness.

Some mediums have greater prestige than others. By "prestige," I mean that standing which a man or an organization must have whose statements you accept with but little or no question.

Choosing the Medium of Greatest Prestige

Suppose that you are on the mailing list of a bond house, and are also a regular reader of a morning paper, a subscriber to a monthly magazine and an illustrated weekly of national circulation, a daily patron of the street cars and an unintentional though by no means uninfluenced observer of painted bulletins.

Suppose that the bond house sends you a circular, and that precisely the offer it makes you appears in your newspaper, your magazine, your illustrated weekly, in street cars, and on bulletin boards. Which will make the greatest impression?

A Case in Point

If your purchases from the bond house have been profitable, the chances are their circular would have the most prestige. Had you been indifferently served, or had you later found out, or thought you had found out, that some other house would have given you the same security and a better rate of interest, or if you had never made an investment of that sort and knew nothing at all about this bond house, save through the circular, it would be the least effective of the mediums reaching you.

But if you were in position to make an investment when you get the circular, but had never heard of the bond house, it is certain that the advertisement in your favorite magazine or in your daily paper would have given to the circular a prestige and influence which it could not possibly have had in any other case.

Prestige, therefore, is either the cumulative result of the best type of advertising, or it is a reinforcement of a previously created confidence in a medium in the minds of the individual members of the group which makes the medium possible.

Buying Space Requires Careful Analysis

Because of competition among men who own and control advertising mediums, it is wise to analyze and weigh carefully before buying space. So many delicate factors have to be considered in determining which is the best medium, or the best selection from a number of mediums.

The Intrinsic Value of Mediums and Aggressive Salesmanship

The keen observer will also discover a disparity between the intrinsic value of mediums and the aggressiveness and convincing power of the personal salesmanship which represents them. For many years country newspapers throughout the United States sold advertising space to patent-medicine houses for less than cost. These publishers figured that to get money for space they had to fill anyhow was like finding it. Skilful salesmen placed these remedies in drug stores and then made space contracts for from one to three years with publishers. Increased enlightenment on the part of the publisher has just about put an end to this kind of business.

Service by the Representative of a Medium Is an Important Factor

Many of the best and strongest mediums are represented by salesmen of the true service type, men who will not sell the advertiser space unless they are sure that the nature of his business and his plans for "cashing in" on his advertising expenditure will be acceptable to the readers of the medium. In contrast to this position we have that of a number of splendid advertising mediums which are undersold. The publishers take the ground that it is undignified to send out men to persuade the advertiser to use their columns. With still other mediums the personal salesmanship of the advertising representative is the most interesting, aggressive, and valuable service which the advertiser buys.

The first thing an advertiser has to do is to fix

clearly in his mind the characteristics of the particular group to which the story will most logically appeal. In some cases this group may be numerically smaller than that reached by the advertising medium. Then it is indeed wise for him to consider whether he will concentrate on one medium that has prestige, even though he cannot expect his own buying group to consist of more than a small portion of that which creates the medium, or if he shall use several units reaching groups smaller than that which he is creating for himself.

One Large Group vs. Several Small Groups

This is the problem which retail stores in big cities can never get away from. Shall the proprietor concentrate his appropriation on one publication, knowing that he could not possibly serve all of its readers if they should come to his store? Or shall he scatter his appropriation among several daily newspapers, knowing that from each he can gather a certain number of individuals most susceptible to his offers, just as with a magnet one can pick out from a tray of ashes and iron fillings every particle of metal?

If some one medium dominates the whole field, he must decide whether he will make his business conform to the characteristics of the group which constitutes the medium, or if he will make selections from various groups and build up a following of his own.

The problem is intensified as soon as mail-order ad-

vertising and national advertising are taken up. But I shall defer consideration of these subjects until a later chapter.

The Different Mediums Used in Advertising

The mediums which are recognized as worthy of every advertiser's consideration are listed as follows: Newspapers, Magazines (popular, technical, trade, and class), Street Cars, Posting, Painted Bulletins and Walls, Electric Signs, Window Displays, Store Demonstrations, Sampling, House-to-House Canvassing, Form Letters and Mailing Cards or Circulars sent to lists of names, Novelties, such as Calendars, Blotters, and the like.

Group of Advertisers Who Find Newspapers the Best Medium

What the newspaper gives us, no matter where it is published, is news. By "news" I mean a record of things that happen to people. They interest us because we are human and they might happen to us, too. The newspaper is ephemeral. Its mission is ended when it has been read; its life is over when the succeeding issue is on the market. It is as hard to find yesterday's newspaper as it is to remember who was the last vice-president.

The Daily Newspaper Ideal for Advertising the Local Store

Two distinct classes of advertisers, differing radically in character, find the newspaper their best avenue to a market. First of these is the retail store, which, in order to pay such constant overhead expenses as interest on capital, rent, salaries, insurance, etc., *must* do a business *every* day. The daily paper is the ideal medium for getting the public to come to

the store for a definite and specific purpose, a purpose which, if the truth be told, the advertiser has put into its mind.

The other class consists of those whose business timeliness is the most conspicuous feature. The newspaper is the best medium for satisfying occasional, temporary, and emergency business needs. The want columns of a metropolitan newspaper show up human nature in its most unsettled state with relation to business. It may seem paradoxical that the best publication for the continuous upbuilding of a strongly entrenched department store is also the most competent medium for the man out of a job or the employer who needs more help. In the "want ads" the man who has old clothes to sell can most speedily convert them into cash. There rooms are rented and roomers find new quarters. To any one who has never spent a couple of hours in reading the "Want Section" of a Sunday newspaper, I recommend it. He will get more thrills out of it and more things to think about, more sidelights on human nature, than are to be had in the same time in any other way.

The Newspaper Best Medium for Satisfying Immediate Needs

In the "want" columns and in the daily announcements of the department store the best appeal to the group which constitutes a newspaper must always be foremost—the timeliness of to-day's presentation and the necessity for immediate action. This is the general practice of the most successful advertisers.

Men who sell advertising space in magazines of which fiction is the important feature will tell you that there is a universal demand for such literature; and that it is when you are relaxed and reading a magazine that you are most ready to receive new ideas. It is noteworthy, also, that a fiction magazine can be picked up at any time, now or several months from now, with equal pleasure.

Fiction Magazines as an Advertising Medium

The advertiser whose goods can be sold all over the United States is urged to use national magazines, because, having a permanent story to tell, he reaches the public at a time when it is most likely to grant him consideration. Many advertisers have built up a large business in this way.

Some successful magazines, particularly our national weeklies, combine the "pulling" points of magazines and newspapers, i. e., (1) their fiction is of such quality as to be worth keeping for future reading, and (2) timely features are dealt with more thoroughly than the newspaper can treat them.

The National Weeklies as a Combination Newspaper and Magazine Medium

Advertisers classify technical, trade, and class publications as magazines, for the reason that the groups to which they appeal are not confined as to locality; they have subscribers in every part of the United States. A number of technical magazines are really trade directories the last issue of which may justly be regarded as a complete and up-to-date manual of a trade which may cover the entire United States,

Technical, Trade, and Class Publications

with representatives in almost every city. The same statement might be made concerning class papers, although sectional lines are more clearly drawn in this field.

Farm Papers, the Trade Publication of a Great Class

Farm papers are usually listed under class publications. Some of them have a national scope but deal with but one industry, such as horses, cattle, or poultry breeding. Others take up the detail of soil, climate, and the general conditions of the principal crop of the particular belt or territory they cover. The latter are really trade papers of over six million American farmers. Each one of them operates a farm large enough to be properly regarded as a business unit, a separate producing and merchandising establishment, as well as a consuming unit, connected with many different consuming groups.

How to Judge a Class Publication

In determining the value of these class publications, editorial prestige, the censorship of the advertising pages, the circulation of the paper, its prestige and subscription price, whether or not the sale of subscriptions is stimulated by offering premiums—and if so, what kind of premiums?—all these are factors which the advertiser who uses their space should consider seriously.

The "Mahin Advertising Data Book," 1913–1914 (page 427), classifies the 22,141 United States publications, with their aggregate circulation of 164,463,040. This list gives the advertiser ample opportunity, and, as is always the case where opportunity is large,

the responsibility for discrimination is increased exceedingly. The classification follows:

	NUMBER	AVERAGE CIRCULATION
Daily	2600	24,211,977
Sunday only	520	13,347,282
Semi and tri-weekly	708	2,648,308
Weekly	15,097	40,822,965
Monthly	2491	63,280,535
All other	725	20,151,793

REFERENCES ON CHAPTER VI

In "The Art of Newspaper Making," 1895 (D. Appleton & Company, New York), Charles A. Dana, one of the greatest American journalists, has given us his ideas about writing copy for and publishing a paper.

"The Autobiography of Benjamin Franklin," 1902 (Houghton, Mifflin & Company, New York), gives the reader a very good idea of the status of advertising at that time. Franklin foresaw the tremendous development of advertising mediums, and his pioneer work in system may well be regarded as the foundation of modern and scientific management.

"Astir," by John Adams Thayer, 1913 (Small, Maynard & Company, Boston), is a frank revelation of the ways of magazine publishers, their ideals, and their methods. If the book contained nothing more than his correspondence with Mr. Frank A. Munsey, who gave us the low-priced fiction magazine and has so largely influenced the history of publishing in the United States during the last twenty-five years—it would be worth careful reading.

CHAPTER VII

ADVERTISING MEDIUMS (*Continued*)

IN JANUARY, 1914, there were 58,000 street cars in operation in the United States, each carrying advertising. The standard street-car card is eleven inches high and twenty-one inches wide. Many manufacturers and retailers favor this form of advertising because it gives them a chance to reproduce their package in its original colors.

Street-car advertising is peculiarly adapted to continuous advertising, because the cars run every day in the year. They follow the arteries of trade. The number of cars run on any given line is increased just as fast as the number of patrons increases. More people means more cars, and that means more publicity for car cards. And the longer the haul, the more time the traveler has for reading these cards.

Street-car Advertising Analyzed

Several different cards may be run by the same manufacturer at the same time. Many advertisers use as many as six at once, with sixty words on each. Some favor the poster idea; others rely wholly upon text.

The Use, Checking, and Cost of Street-car Advertising

The advertiser is given a list of the numbers of the cars in which his cards are appearing; check-

ers visit the barns to verify these lists. Cards are changed once a month, usually. Street-car space costs 40 cents a card per month per car for a full run, and 45 cents for a half run.

The Forerunners of Modern Posting

Pasting sheets of printed paper on walls, the sides of barns, and on specially prepared boards is probably the most elementary form of advertising. Time tables tacked up in railway stations, notices pinned or pasted up in post-offices, the bulletin boards on which most large institutions make announcements—these were the forerunners of modern billposting.

The Evolution of the Twenty-four Sheet Poster

Circus and theatrical attractions, recognizing the power of color with the public, and desiring to create an impression of bigness, kept increasing the size of posters. In this way the 8-sheet, the 16-sheet, and 24-sheet posters of to-day came about. In an early day it was possible to print only one sheet, 28 x 42 inches, at a time. It had to be sent through the press once for each color; so the production of a 24-sheet poster meant a great deal of detail work in design, mechanical execution, handling in the printing offices, sampling, shipping, and in finally placing it on the boards.

Billposting Service as Standardized in United States

Billposting has been standardized in the United States. In about four thousand towns and cities there are regular plants which maintain boards uniformly eight feet high, but varying in width to accommodate one or many posters.

The 8-sheet poster is the unit of measurement. In large cities property owners get high rents for the ground on which the boards stand. Billposting service is usually sold at a certain price per sheet per month, ranging from 7 cents in smaller cities to 20 cents per sheet in New York and Chicago.

A billposter agrees to furnish a list of locations on which posters have been placed, and to keep them in good condition for thirty days. The advertiser furnishes from 10 to 20 per cent. more paper than the actual number of locations require. Since it is necessary to renew paper every thirty days, a month has become the basis on which it is sold.

Some advertisers post continuously, but change the showing once a month; others post alternate months; still others post one month in the spring and one in the fall. Some use posting only when they want to introduce a product.

Painted Bulletins

A painted bulletin is usually twenty-five feet long and eight feet high, made of galvanized iron, and sold on a twelve months' contract at 40 cents per running foot per month, to include one renewal a year. Rents for locations are higher than for billboards, because the contract runs for a longer period. In very many cities painted boards dominate the most populous centres. Advertisers who want to create an impression of permanence prefer paint.

The cheapest and most effective outdoor advertising is on outside store walls, if locations are

available. Successful advertisers usually go into a city, buy a well-distributed wall showing, and supplement it with painted bulletin locations wherever walls are not to be had. Walls are painted once a year. The minimum price is 5 cents per square foot. At that rate, a 20 x 40 foot wall costs the advertiser $40 for a twelve months' showing, this to include the cost of designing and painting.

Bulletins and Walls Compared

An 8 x 25 foot painted bulletin, being a selected location as a rule, is considered to have the same attention value as an 800-square-foot wall. Forty cents a month per running foot, or 5 cents per square foot per year, on a board eight feet high, means that a bulletin costs twelve times as much per square foot as a wall. But the 200 square feet in a 25-foot bulletin is usually considered equivalent to 800 feet in a wall, if one takes into consideration the better location, that the bulletin is painted twice a year, and that its smoother surface makes finer pictorial work possible.

The Comparative Cost of "Paper" and "Paint"

A 24-sheet poster, at 20 cents per sheet a month, costs $5.60. It is generally compared with a 25-foot bulletin, as they occupy about the same space. At 40 cents per running foot, a bulletin costs $10 a month. A poster costs $5.60 per month, plus the cost of paper, which will vary from 40 cents to $1 each, plus the cost of expressage. The cost of paint and paper is so nearly the same, therefore, that competition is keen wherever they are handled by dif-

ferent interests. In a number of prominent cities, notably Boston, Cleveland, Detroit, Seattle, Portland, San Francisco, and Los Angeles, paint and posting interests are identical. The tendency of advertisers generally is to use paint for twelve months' showing and paper for all shorter periods.

Electric Signs

Electric signs have become an important feature of outdoor advertising in large cities. It is difficult for some people to believe that a chewing-gum manufacturer, for example, can afford to pay $18,000 a year for an electric sign showing the full length of Broadway from Twenty-third to Forty-second Street, but that is less than $50 a day, and it may safely be said that at least 200,000 people, each having money enough to buy chewing-gum, see this sign every day.

This completes the list of mediums for which a national service has been organized. It is possible for an advertiser to get accurate information about all these mediums in one office, and also to contract therefor dependable, easily verifiable service, which will be billed to him monthly, and may be paid for with a single check.

There are other advertising mediums which are quite generally handled in the advertiser's organization.

Window Displays

Window displays can be purchased from houses which make a specialty of preparing them. But it is always wisest for the advertiser to have his own men put them up. A vast amount of lithographed material sent out to dealers is wasted. They store it, temporarily of course,

under the counter; and very often it gets no further. Sometimes it is never unpacked or brought up from the basement. Window display costs anywhere from 25 cents to several dollars per window. The advertiser should be very sure of results before he undertakes this form of advertising.

Store Demonstrations

Food manufacturers frequently use store demonstrations to introduce a product. The demonstrators should be capable saleswomen who can take enough orders and make enough direct sales to pay their way largely. Some retailers object to demonstrations, declaring that they divert attention from the regular stock. The average grocery store serves less than one hundred families; in fact, the average is only a little more than sixty. Unless the demonstrator does pay her way in actual sales, the publicity is very expensive.

Sampling

Sampling is also favored by food manufacturers. A crew of men, supervised by a dependable superintendent, gives samples direct to housewives, or hands out coupons redeemable at a grocery store either in full or part payment for a package of the goods being advertised. The manufacturer allows the grocer full credit, in lieu of cash for goods, for all coupons redeemed before a certain date.

House-to-house Canvassing

House-to-house canvassing is an extension of the demonstration idea. The canvasser frequently makes direct sales to the housewife and turns them over to her grocer. Sometimes

the canvasser goes out with the grocer's order boy, gives a talk about the goods at each stop, and makes direct sales.

Form Letters, Mailing Cards, Folders

Form letters, mailing cards, and folders have played a considerable rôle in advertising, and are still used by many advertisers. They are expensive when one considers the number of people reached, because Uncle Sam does not make a discriminating rate in favor of printed matter of this kind, as he does for newspapers, magazines, and periodicals which travel as second-class matter. Very often advertisers go to a dealer, sell him a bill of goods, and get the names of his customers and prospectives. The manufacturer believes he can demonstrate to the customer the merits of his goods more quickly and accurately than the dealer can. He also believes that the literature he sends to these customers influences and reinforces the dealer's attitude toward his product.

Cards and Other Printed Matter Used to Assist Salesmen

Mailing cards are sent out in advance of salesmen calling on the trade. They also announce changes in price. A number of wholesale jobbing houses get all orders from dealers through the mail. Such houses get out a catalogue at least once a month. Many jobbers anticipate the calls of their salesmen by working the trade by mail, hoping to get a small initial order, or a request for a salesman to call. Others send out printed matter, to keep up the

dealer's interest during the interval between the salesman's visits.

Calendars and Novelties

The use of calendars and novelties is quite a different but very popular form of advertising. Theoretically, the value of the calendar, or pocketbook, or knife, or blotter, with the advertiser's name on it is that because it is a useful article, it will keep the advertiser's name constantly before the user. The truth of the matter is that few men could tell you the name which is on the blotter which they have been using every day for a week.

Selling Ideas Used by Novelty Salesmen

The best novelty salesmen do not use the "Keep your name before the public" plea, for they know that the advertiser can get this service elsewhere for much less money. The plan most used is to ask a banker, for instance, how he would like to have fifty men who had never been in his bank, all of them desirable patrons, come in to see him and accept a favor from him, at a cost not to exceed 25 cents each. The first time it is presented, this proposition is very tempting. The salesman shows him a reproduction of a beautiful picture, explains that he will have it made up in a handsome calendar, and has the banker copy a form letter which has been successful in other places; it invites the recipient to stop at the bank some day, when he is going by, and get a calendar, which has been set aside for him. The salesman cautions the banker to write the man's name on the envelope

before he comes in, so that he will be sure to think he is getting something which has been especially reserved for him. One cannot say this is not successful advertising; and for certain lines of business it seems the cheapest and quickest approach.

Adding Value to Novelties

Novelty salesmen who want to build a permanent clientele are most concerned about *how* their customers use these novelties. Suppose that, having given a clerk a strong sales talk in which he emphasizes the chance to develop selling ability by making every effort to sell the article which the salesman has just sold the proprietor, the salesman hands the clerk a pencil and tells him to use it writing out orders. Every time he uses it, that pencil reminds the clerk of that sales talk. To merely hand out the pencil, as if the salesman himself considered it of but little value, would be sheer waste. Calendars and novelties should remind the recipient of a forceful sales talk; when they do, they have a sentimental value quite apart from and beyond their actual cost.

Moving-picture Slides

Slides for motion-picture houses are worth while for local merchants who have the exclusive sale of a nationally advertised brand of goods for their own city or a restricted community. Attempts have been made to organize the motion-picture business, so that slides might be sold on a national service basis; but very little headway has been made.

REFERENCES ON CHAPTER VII

There is plenty of literature about advertising mediums. Publishers and space-owners are continually putting out books that deal with one or another phase of the subject. Much of this material might be classed as special pleading. Too much of it extols one class of mediums and condemns all others.

Especially noteworthy is "Selling Forces," 1913, by the Curtis Publishing Company. It covers a broad field and is a comprehensive and authoritative treatise on the whole subject of advertising.

Henry S. Bunting has written several books on novelty advertising. All of them are worth reading. "Specialty Advertising," 1913 (the Novelty News Company, Chicago), is his latest and best. It defines clearly the principles which underlie all successful advertising.

For practical suggestions and methods, see "Poster Advertising," 1910, by G. H. E. Hawkins, Chicago, also "Newspaper Advertising," 1914, by the same author.

CHAPTER VIII

BUILDING AND TESTING AN ADVERTISEMENT

COPY is the term by which advertising men designate everything the advertiser puts into the space he buys. It is *built*, rather than written or designed.

What the Copy Writer Should Know

A copy writer should have an accurate, comprehensive statement of the characteristics of the group to whom the copy is to appeal. He should *know* what the wares advertised will do, and what they cannot be expected to do, in the hands of the consumer. He should have before him an analysis of all competitors' advertising, so that he may not reinforce their work by using points which they have preëmpted. He should know what kind of salesmanship, written and personal, is to be used in connection with the copy. He usually has the responsibility of preparing anticipatory and follow-up literature to be used in connection with advertisements to appear in standard mediums. In order to do this most effectively, he ought to be thoroughly saturated with the sales policy of the house for which he is writing.

A copy writer should regard himself as an inter-

preter between the man who has something to sell and the people who can use it. Many points which the manufacturer finds interesting, in producing his wares, would only confuse the buyer and distract his attention. The purchaser is primarily interested in the satisfaction he derives from his purchase. His point of view differs radically from that of the retail clerk, or the dealer, or the salesman who represents the manufacturer in distributing his goods through the established channels of trade.

The Copy Writer an Interpreter Between Advertiser and Buying Group

Unless the copy writer and the commercial artist can almost intuitively grasp the group spirit, and emphasize in words and pictures those points of the article being advertised which will appeal most strongly to the individuals which compose the group, their technical ability will count for very little. I am convinced that the number of persons who can write or illustrate advertising copy is comparatively small. They must have a natural bent or gift for it, somewhat akin to the reporter's "nose for news." It is certain, however, that experience and the following of generally accepted standards will develop, intensify, and make more practical a natural gift for writing and illustrating copy.

Writing and Illustrating Advertisements with a Strong Group Appeal—a Natural Gift

The novel and spectacular can generally be found within the advertiser's organization or in the wares produced. The copy writer who gives the impression that he has *created* the novel or sen-

sational features of the advertising, defeats its purpose.

Diagramming the Advertisement

When the size of an advertisement and what is to be said in it have been determined, the best plan is for the copy writer to make a diagram, enclosing the exact amount of space to be used; then indicate that portion which will be reserved for illustration; locate with heavy lines, or letter in, the large display words, in order to get the proper emphasis and balance for the principal points; and finally fill in the intervening spaces with the text matter.

Brevity Not Necessarily Good

It is a great mistake to believe that, because people remember very little of what they see, an advertisement should consist of very few words. We remember Dickens' characters because he restated their peculiarities again and again, until they were unforgettable. A good story writer grips the reader's attention in the first paragraph and carries it through column after column of interesting matter, all the time burning into his consciousness the points which are to be emphasized.

Advertisements Must Attract and Create Desire to Buy

Display advertisements serve two purposes: (1) they impress the casual reader, and (2) they put the buying impulse into the mind of the possible customer. Both kinds must be considered in making a layout. An advertisement needs to be a good one, even if it is to have no more attention than that casually given to a poster. Small type should be saved for *clinching*

the buying impulse, for if the reader takes time to read the small type, it means that his curiosity has been aroused by the display features.

Ten Tests of an Advertisement

The ten tests which follow were formulated for checking up work in our organization. But they will be of use to the copy writer, to the retailer who has an advertising manager, to the manufacturer, to the sales manager, and to the salesman.

(1) *Is your advertisement institutional?* Does it appeal most strongly to the group spirit of the people to whom it is directed? To answer this question one must have complete data as to the tastes, incomes, ideals, purposes, and habits of life of the group which is to be influenced. It also calls for the intelligent scrutiny of the reading pages of those publications which have the largest circulation in that group.

An institution is composed of individuals who have many thoughts in common. The circulation of a successful publication is institutional. The group which reads a single publication, day after day, will unconsciously be influenced by and then accept its institutional viewpoint. A well-managed business house develops an established order of doing things. This makes it institutional in character.

The best copy reflects the institutional quality of the business which it is promoting, and takes cognizance, in its appeal, of the institutional traits of the readers.

(2) *Is your copy natural?* An advertisement should carry over to the reader the individuality of the advertiser. Some publicity fails because the author of it is under the strain of being unnatural. His copy is forced, and does not ring true. A good advertisement is a mental photograph of the policy and principles of the advertiser. The copy writer must be able to interpret the advertiser's personality, and so to express his ideas in print that they are instantly recognized as a sincere message from him. The copy writer who can make his copy carry over to the reader that intangible something which pervades every successful commercial organization is a success.

(3) *Is it specific?* Unless it possess individuality, an advertisement helps competitors as much as it does the institution which is paying for it. To find out whether or not an advertisement is specific, substitute the name of a competitor. If the advertisement is just as effective, it lacks individuality. A specific advertisement meets conditions squarely as they are, not as they ought to be. It gives a definite reason for wishing the prospective customer's immediate attention, and justifies its existence from the viewpoint of the advertiser.

It should so concentrate attention on the article advertised that the reader will be completely absorbed in and unconsciously obtain a clear idea of the story itself, rather than be impressed merely by the manner in which it has been told. If the cleverness of wording or a too challenging illustration divert the

reader's attention from the article itself, the advertisement is a failure.

(4) *Is it timely?* Timely advertising inspires the belief that the advertiser is wide awake. From the general trend of events, successful general advertisers forecast conditions for the various seasons of the year, and make plans months ahead. The retailer should do likewise. It gets much more satisfactory results than will a patchwork campaign constructed from day to day in a hit-or-miss fashion.

Should the advertiser wish to take advantage of some unusual event, it is very easy to substitute a piece of timely copy which will be in harmony both with what has preceded and with what is to follow. In conducting an editorial or a feature campaign, a newspaper is almost sure to create and crystallize a sentiment upon which an advertiser can "cash in" by adapting his copy to the timeliness of the reading pages. Timeliness is offering the public what it wants just when it ought to want it most.

(5) *Is it pertinent?* An advertisement should be written with due regard to the viewpoint of the purchaser. "How is it made?" does not interest him so much as "What will it do for *me?*" It is often well to humor pretended motives, or subtly to suggest the real ones. Many a piano is bought for another purpose than to develop the musical talent of a family. The purchase actually marks its social advancement from the breadwinning state to the possession of a recognized luxury.

Suggestion, the most potent element of personal salesmanship, is utilized no less effectively on the printed page. A father who believes that the possession of a diamond would foster in his daughter a love of display and extravagance will not buy her one; but he might be won over by the suggestion that in no other way could he make so concrete and permanent an expression of the sentiment he entertains for her. It is often a devious mental route which leads to the pursestrings of the public.

(6) *Is it consistent?* A consistent advertisement must survive all the previously outlined tests; and it must do more. It must be a perfect link in the chain of the advertiser's selling policy. Consistency calls for coöperation from the advertiser's salespeople. He cannot get this unless he instructs them fully about the purpose of his advertising and the part each is expected to perform in "cashing in" on it. Consistency covers the relationship of the component parts of a campaign to the proposition as a whole. Methods that bring success to one institution are ridiculously useless for another. To exploit a bank in the extravagant superlatives of a circus publicity man would be absurd, and disastrous. On the other hand, some advertisers, fearing to appear undignified or sensational, actually say nothing that is interesting in their announcements.

(7) *Is it persistent?* A single advertisement cannot be said to possess the quality of persistency, but it can form a part of and bear out a plan to which

a business has adhered strictly for years. A trademark indicates that each advertisement containing it is one of a series, or that the use of advertising space is the established policy of the house. In no other way can a merchant win confidence or establish so thorough a credit with the public as by advertising prudently and persistently. Confidence is a plant of slow growth, and persistency is its sun, rain, and fertilizer. A persistent advertising campaign covering a period of three years in legitimate publications will seldom fail to produce a "good-will" asset worth at least as much as the amount of money spent for space during that time.

(8) *Is it authoritative?* The leaders of the masses have one distinguishing characteristic in common—they are confident in affirmation. The advertiser must at all times and under all conditions maintain an authoritative tone. No one believes a man whose advertisements show that he does not believe in himself. Without the reader's confidence, advertising is wasting money.

Yet too wanton an exhibition of self-confidence is dangerous. The public will side with a man who demonstrates his leadership, but it cannot be bulldozed. The results of advertising are dependent upon the voluntary action of free people; threats, scares, or pessimistic utterances never make friends or customers. Optimism is a confidence-inspiring tonic. The optimist who is tempered by self-control is the successful advertiser.

(9) *Is it plausible?* The word "plausible" has been in bad company. Its exact meaning is "to tell a story so that it is most acceptable to the reader." All advertising should serve the reader. Therefore the truth should be plausibly told if in that way the reader can most easily grasp it.

It is not enough that an advertisement tell the truth. The reader must *believe* before it can bring results. Good advertising copy is 100 per cent. salesmanship, not 125 per cent., which the wise buyer discounts at once, nor 75 per cent., the weak refuge of negatively honest men who endeavor to conceal their own shortcomings by decrying others. One hundred per cent. salesmanship is the ability to state in an interesting and convincing (hence plausible) manner all the desirable features of an article.

(10) *Is it sincere?* The best advertisement influences the reader to buy, honestly feeling that he or she has acted on his or her own judgment. Sincerity is indicated by the use of simple sentences and terse, frank statements. Clearness of expression, fidelity in illustration, and accuracy in description are the natural reflections of a sincere state of mind. Sincerity cannot be feigned; it must actually exist. Where it does exist, the matter of expression will take care of itself.

REFERENCES ON CHAPTER VIII

Some years ago a host of correspondence schools were offering to teach young men and women how to

write advertisements. One of the special inducements was the promise of a large salary. The opportunities for such salaries do exist. But no correspondence course fits a man for earning one. He must also have experience. So far as I have had experience with them, these schools are worth while. One of the best things a student gets there is the habit of regular, systematic study. Any correspondence course on any subject will do this.

The text-books of the International Correspondence Schools, Scranton, Pa., are particularly accurate and complete, and cover a wide range of technical detail.

"Practical Publicity," 1906 (the Matthews-Northrup Works, Buffalo), by Truman A. DeWeese, is a "work for the advertiser, and is intended to be helpful to every man who has anything to sell and who is ambitious to enlarge the market for his product," to put it in the author's own words. The book is adequate and unusually readable.

CHAPTER IX

APPLICATION OF THE TEN TESTS

IN ORDER to suggest a method of the application of the principles outlined in the previous chapters, and particularly the ten tests given in the previous chapter, I am showing herewith characteristic advertisements of John Wanamaker of Philadelphia, Marshall Field & Company of Chicago, Filene's of Boston, William Taylor & Son of Cleveland, B. Altman & Company, Saks & Company, and Rogers Peet Company of New York City. I have chosen purposely specimens of advertising of houses whose advertising is generally considered to be the best in the retail field.

In each one of these advertisements, which are reproduced from the daily papers, the test of institutionalism is justified by the tone of each advertisement taken as a whole.

Institutionalism as Embodied in Newspaper Advertisements

Each one of the stores represented has, after years of patient and continuous advertising, built up a constituency that has characteristics individual, distinctive, and responsive to a form of announcement that has stood the test of time, and which suggests confidence because of familiarity.

B. Altman & Co.

have prepared for to-morrow (Thursday)

An Interesting Sale of Women's Summer Blouses

In attractive styles and such desirable lingerie fabrics as batiste, organdie and voile, at the exceptional prices of

$1.90, $2.25, $3.75, $4.65 & $6.75

First Clearance

Wool Dress Goods Remnants

We desire to dispose very quickly and completely of all the remnants remaining in our Colored and Black Dress Goods Sections. To accomplish this, we have made further and final reductions on every one. This occasion presents the very best opportunity of the entire season to economize on Dress Goods needs. *Second Floor.*

33-inch Imported Natural Shantung

All-Silk Pongee at 65c a Yard.

A fabric known for its dependably splendid washing qualities and general all-round usefulness, especially suitable for traveling dresses, skirts worn in tub frocks for outing wear, also pajamas. Plain of now at a price which should sell this quantity quickly. *Second Floor.*

Women's Summer Dresses, Hundreds, in a Special Sale at $10.00

Our new Wabash Avenue Salesroom for Women's Street Dresses (from $5.00 to $25.00) has been open but one week. Yet during that time thousands of the women of Chicago have visited it, drawn here by the exceptional merchandise being displayed.

Following our daily policy here at that opening the Dresses offered for tomorrow will stand out as some of the finest values we have ever shown.

(A) Of fine, soft voile, in a wide dresden, bird motif. A dress that may be worn—

(B) Bemaided crepe dress, with organdy collar, collar and cuffs, bow tunic. Plain, Cornflower and white.

(C) Dresses for morning wear, of fine dark dimity. Cream lace bow, in white, Copenhagen, rose, gray, tan and lavender.

(D) Voile dresses with hair stripes and polka dot, dresden and color stripped with lace.

light linen. All neck trims in tailette Ribbon to match, pink and light blue included. Other shades extra. 2 and 3 inch bordered and color striped ribbon in white, pink and light blue.

ORIENTAL RUGS—

At Prices Hard to Parallel at Any Time

We desire an opportunity to prove to you by showing the Rugs themselves that the prices we quote are exceedingly low—or looking at it from the other viewpoint, that the Rugs are remarkably fine at the prices. The designs are so individual that the very expression of a room can be changed by shifting the position of the Rug. We especially commend the following

Mesopotamian Mosul Rugs, Persian Serabend Rugs, $3.9 by 6.6 in. size, $12.50 to $25.00.

Persian Sarouk Rugs, closely woven, 3.3 by 5.3 in. size, $17.50 to $32.50.

Room-Size Rugs, from Shiraz, 5.8 by 8.0 in., at $90.00, in a magnificent large Kermanshah at $1350.00.

Third Floor

The Tudor Living Room

which we recently bought in England now which has been re-erected in our Austin Room is exciting a great deal of interest, and the number of visitors is increasing daily.

It's opened to all a warm welcome to one who reads the art and of a bad new taste about ten year 1603 and was lived in by Catherine Parr, widow of Henry VIII.

Fifth Floor, North Street, Wabash Avenue.

A Rare Collection of 350 Japanese Water Colors

Now on Exhibition on our Private Galleries

This is probably the most representative showing of water colors by the leading Japanese artists that has ever been made in Chicago or vicinity.

Each exhibit was painted under the direction of Theodore Ernest Fox Cook, former head of the Japanese department of the Museum of Fine Arts and who was the Imperial Institute of Tokio.

These include Trip-plays on silk and paper, Water Colors on silk and paper, and Kakemono paintings.

The subjects are mostly birds, flowers and fishes. Each picture is signed by the artist and bears his personal seal. Prices are actually levied to new items.

The prices are $6, $8.00, $12.50, $15.00, $18.00 and $21.00

Included in the collection are Hand-Colored Japanese Photographs at $3c.

Fourth Floor, Auditorium Building.

OUTDOOR PORCH SHADES keep out the sun and let in the breeze. Convenient and economical. Fifth Floor.

Only Seven Days More of the Clearance of COWAN FURNITURE

The opportunity for securing pieces of this high grade Furniture at unprecedented prices is rapidly drawing to a close. The wants of the future should be anticipated this week, as the opportunity will probably never be presented again. Furniture for every part of the home is represented.

Eighth Floor

ANNOUNCING

An exhibition of

HIGH GRADE FOOTWEAR

which, we can safely say, has never been equalled.

Our enlarged Sections for Women's and Children's Shoes, now practically completed, are formally opened today. This will emphasize the largest, most complete, and most elegant Women's and Children's Shoe Section in existence.

Included are many new ideas that will undoubtedly be extensively copied. The exclusive and unusual throughout the week. The public is cordially invited.

Fourth Floor

The Ribbon Sale Is at Its Height

Has been by far the most successful of all our previous events. The present stock is, we believe, the largest and most complete collection of Ribbons ever placed on sale anywhere. The immense assortment has been increased every day by new arrivals. As rapidly as our regular lines are depleted they are supplemented from an enormous reserve—thus leaving the entire stock still complete and intact with clean fresh Ribbons in as large variety as at any time since the sale began

45 to 10-inch Bemaided Taffeta, Bemaided Satin, Striped Taffeta, Plain Taffeta Cluster and Many Printed Taffeta with Plain Satin Stripe, Satin and Moire, a large variety of patterns in light and dark grounds at 25c, 30c, 35c, 45c, 50c, and 60c per yard.

All-Silk Wash Ribbon in two pongee. 36 inches and have been purchased to match pink and light blue. 24 inch plain white taffeta Ribbon to match, pink and light blue included. Other shades extra. 2 and 3 inch bordered and color striped ribbon in white, pink and light blue.

The Newest Ideas in Smart Blouses

At $3.98—Fine muslin, one of fine organdy, made with pointed front and back, long sleeves, roll collar finished with novelty tie. Our colors, of crepe de chine, for white and Sand, with collar, vest and cuffs of black and white striped organdy.

At $5.00—Fine sheer muslin, of fine batiste, made with fancy tucked front and back, long sleeves, roll collar and turn-back cuffs, finished with hemstitched hem. Our colors of white, finished front and back, low collar and short sleeves.

At $5.00—A pretty model in white voile, with sleeves and roll collar hand embroidered in front.

At $7.50—Two models in Dimity and one of Voile front made with the standard waistband of pique, finished with large collar and turnback, long sleeves, collar and cuffs of pique, the other model of fine batiste pointed front and back, and pointed collar and short sleeves. *Fourth Floor*

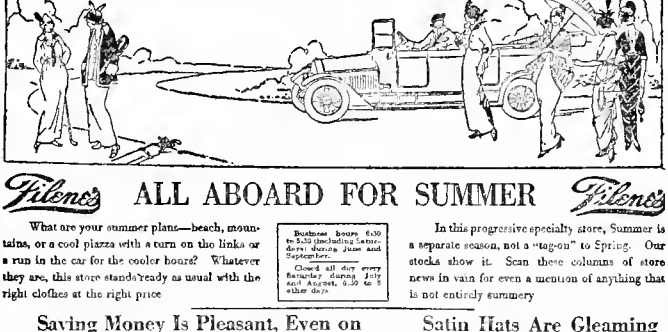
Better telephone Oxford 1 and have your Furs put in Safe Cold Storage at once



Filene's ALL ABOARD FOR SUMMER Filene's

What are your summer plans—beach, mountains, or a cool piazza with a turn on the links or a run in the car for the cooler hours? Whatever they are, this store stands ready as usual with the right clothes at the right price

Business hours 8:30 to 5:30 (including Saturdays) during June and September.

Closed all day every Saturday during July and August, 8:30 to 1 other days

In this progressive specialty store, Summer is a separate season, not a "stag-on" to Spring. Our stocks show it. Scan these columns of store news in vain for even a mention of anything that is not entirely summery

Saving Money Is Pleasant, Even on Class Day and Commencement Dresses

Tomorrow one can come into the women's dress shop and buy a charming lingerie frock for a Class Day campus, a white net Commencement dress, or a silk dress for a Class Day spread for much less than such dresses usually cost, even here.

Plenty of Summer dresses from wedding guests to street frocks are ready, too, for the demands that June will make.

$15 for $25 Lingerie Dresses

The first embroidery-bordered voile dresses we have seen with the very long new tunic

Sashes of moire ribbon.

$15 for $25 Net Commencement Dresses

These are the result of some very clever designing. The skirt is a succession of flounces, each shorter than the one above, the waist has deep "Bergere" frills, each is kilted-broche.

Figured Crepe and Velvet Ribbon Made This Unusual Dress at $15

Only exciting dresses we believe, have shown this bordering of long tunic and wide girdle with black velvet ribbon. Maisie silk-embroidered than crepe in rose, green, blue or black. Usually $25.00

$18.50 for $25 Crepe de Chine "Quaker" Dresses

This dress is notable for the new pointed "Quaker" collar of white organdie and the long box plaited tunic below the hips. Good colors: greens, browns, blacks and whites.

(Filene's—Fifth Floor)

Women's $40 New Silk Suits, $25

The model is the very one we have been selling in moire at $40. These suits are of faille, in black, navy, blue, light blue and taupe. The fullness of the coat is held in with big silk cords. Long tunic skirt.

$25 New Blue Cloth Suits at $15

One is the most successful plain-tailored model we have had at $25. It is of serge, with button-trimmed coat and tunic skirt. The other is very similar to what the fall suits will be. It is of serge and poplin with long Russian tunic and Paquin coat-tail.

$15 Cool Linen Suits for $10

One has kimono sleeve coat and long "flyback" tunic. Another has Medici collar, lined with white paque, and three tier skirt. WHITE SERGE SUITS are ready at $15 to $10.

(Filene's—Fifth Floor)

Crest Brand Underwear

will not shrink, fits without fullness, and is cut to stay up on the shoulder where it belongs.

Women's Crest Brand Union Suits are 50c and more

Women's Crest Brand Vests are 25c and more.

(Filene's—Third Floor)

June Sale of Aprons

59c for $1 Apron Sets

Percale, gingham and chambray overall aprons, with cap to match, attractively trimmed; elbow sleeves; button in front.

79c for $1.25 Dress Aprons

Fitted percale dress aprons fastening to waistline behind; gored skirt fitted at waist; kimono sleeves, colored embroidery piping. Sizes 34 to 44.

$1 for New Reversible Dress Aprons

can be worn with either side in front, giving double service; adjustable belt. Made on accurate dress patterns. Sizes 34 to 44.

$1.39 for $1.75 New Crepe Apron Sets

A Filene idea. Dainty crepe edged with ball fringe. New shaped neck and puff sleeves. Graded sizes 34 to 44.

(Filene's—Third Floor)

Renova Cleaning

A long-standard Cleaning Service for Your Dress, Clothing, Furnishings

Specialty for This Week

Ladies' and Children's Dresses, all washable $1.50 to $2.50 values, $1.00. Silk dresses, $1.50. Others proportionately low.

(Filene's—Lower Floor)

Girls' Muslin Dresses

Flowered muslin tunic dresses edged with fluffy lace for girls of 6 to 14 are only $3.

Dotted muslin "Eyet" dresses with low necklet, buttoned from neck to hem, 6 to 14 years, $5.

Growing girls of 13 to 17 years for whom it is difficult to get right dresses, may have flowered muslin sash dresses, $5; muslin dimity tunic dresses, $3.95.

(Filene's—Fourth Floor)

Satin Hats Are Gleaming

in the Millinery Shop

White satin or blush-rose satin hats, decked with little wings or wound around with a soft pink bird-breast.

PANAMAS were never more irresistible. Here are big and little ones, sashed or winged, all as cool as they look.

ENOA sailors, horse-hair lace hats, and soft crepe hats are other tokens of Summer in the Millinery Shop.

You can pick up a charming Summer hat here for surprisingly little $2. and $7.50

(Filene's—Fifth Floor)

The "Eleanor Wilson" Cape

has come to the Women's Coat Shop. It is made in the same way as the one chosen by the daughter of the President for her love scene. Black satin, lined with black and white stripe silk, tied with long ends that pass around the waist.

Capes Have Come to Stay

Here are dress capes and sport capes and capes that can go anywhere, in satin, diagonals, checks, epingle or serge.

At **$10.75** are tweeds, serges and checks with lace cape sleeves, and loose box or double ripple capes with short kilted front.

At **$15** are wonderfully good diagonal capes with Roman stripe moire underlinings. In serge capes coats with sleeves are **$18.50.**

Serge coats with removable capes are **$19.75.**

(Filene's—Fifth Floor)

Five-Dollar Tub Skirts

Piques, cottons, khakis, linens, crepes and burlaps—coat skirts, tunic skirts, "apron" skirts, Russian skirts and belted skirts $5.

Two strangers in the Skirt Shop deserve a mention. One is of fine cordelaine, with tailored hip-flounces. The other is a Cornish linen with long "apron" tunic. Each is **$5.**

Other Tub Skirts are **$2.95** to **$8.50.**

(Filene's—Fifth Floor)

Summer Sale of Negligees

Just the cool, comfortable garments that are indispensable when summer flits around. We have prepared three different kinds, one in crepe, one in voile, and one in crepe de chine.

$1.50 for $2 Flowered Crepe Kimonos

Sizes are to 44 inches. Hems are cutaway, neck and sleeves are finished with plaited frills.

$1.95 for $2.95 Figured Voile Negligees

They look so cool that one couldn't feel otherwise in them. Deep collar and cuffs of mull and new-fashioned sacque.

$5 for $8.95 Crinkled Crepe de Chine.

Light or dark colors. Loose, wrapper and simple, with fine plaited silk frilling at neck and sleeves.

Similar reductions will be found on garments in misses' sizes.
Second floor

Our hands have been full these last weeks!

Once again our customary business optimism has been justified

In spite of foreboding in some quarters as to the trend of business, we believed that more men and boys than ever would want substantial, stylish clothing at fair prices.

We provided a most liberal stock, liberal even for us; and that means more variety, more ample range of sizes than most clothiers ever saw.

The month just closed, with its predecessors, has fully justified our optimism—our business has shown a very healthy and satisfactory increase.

So we enter June with new enthusiasm, with renewed confidence that in these days of much exaggeration, substantial quality, generous variety, fair prices and "your money back if you want it," are more appreciated than ever.

Everything men and boys wear.

IF A STORE HAVE DIFFERENT AND BETTER STOCKS ITS GROWTH IS CERTAIN

Weather Today: Fair.

No Skyrocketing Sales

This is just a plain, larger everyday Store, with advantageous opportunities for our customers as they arise daily without any fussing and make-believe, all the marketing being open to our alert buyers.

We do not give orders to take the quality out of the goods to enable us to reduce prices, but consider the nimble sixpence better than the slow shilling, believing in holding up qualities and giving full measure even at smaller profits.

We find ourselves better off by reason of the larger sales.

If all purchasers had a

Knowledgeable Idea

of values, they would soon come to know that the steady day-trade income are regularly selling at the low right prices without any necessity of pumping oxygen into their systems.

[Signed] John Wanamaker.

Bulletins from the Women's Fashion Saloons

Scores of new lines and entire suits are in—$9.75 to $35. Nearly styles, many at less, including the new Salamander Russian blouse suits; navy coat suits; navy and black Jumbo tweed suits, and very clever linen or cool silks.

White serge suits at $27.50 to $50 are—made of genuine, especially fine, white serge.

More than dresses at $6 to $25, white and colored, for morning and afternoon.

More flowered silk crepe dresses at $9.75—smaller's exhilarating blue, lavender, taupe and gray.

Also an ample supply of entire crepe dresses, mostly white, at $8.75 to $40, and voiles at $6.75 to $25.

(First Floor, Central)

Samples of Neckwear —Hand Embroidered

Some a year like yesterday's sale—a number of the fine georgette, linen, organdy, satin and silk hand-made neckwear that sold each midsummer, now in a woman's manager's desk.

They are all hand embroidered in the daintiest fashion, and the samples, like those are always, are lowered like to $25.

On special sales in the Neckwear Section.

(Main Floor, Central)

THIS Summer's cotton fabrics for blouses and dresses

More than usually pretty this season and very popular for afternoon and dance frocks as well as blouses. All the prices are low and many are even below their quality.

Silk and cotton poplins, mostly in stripes, for a yard.

Russian cotton crepe, white and a few colors, for a yard.

Flowered cotton crepe, 36 inches wide, for a yard.

Silk mulmul voile, flower designs, 40 inches wide, for a yard.

Printed cotton voile, 36 inches wide, for a yard.

Flowered batiste, 12½c and 15c a yard.

Beautiful striped cotton, 27 inches wide, 12½c a yard.

(Main Floor, Chestnut)

Wonderful Frocks for Little Girls (Special)

Several hundred white dresses for girls of two to six years established a great demand this morning. Both materials and trimmings, selected especially, are remarkable at the low prices—$1 to $5.

Styles are simple and more elaborate—all have the low French waistline with wide beading run with ribbon, and there are new touches such as the fichu, little "flower girdle," a gathered neckline with simple hand shirredness to produce yokes.

At $1 and $1.50 there are several styles to choose from, and always cool air to $3.

(Third Floor, Chestnut)

Madeira Lunch Sets New as June Roses

Thirty-one new sets beautifully hand embroidered as only the Madeiran can do it, matchless effect, every one separately boxed—$6.50 and $8 a set.

Modeled lunch napkins with the extraordinarily hand, all embroidered, four or five patterns, $6.75 a dozen.

Now in the Yearly Towel Sale

Fine bleached hemstitched towels with damask borders but hemstitched ends—second at 50c each.

Imported pure, fine bleached hemstitched huckaback towels at 50c each.

Big, soft, absorbent cotton bath towels, hemstitched, imported, also 50 and 60c.

(Main Floor, Chestnut)

T-Square Club Exhibit

now in view in the gallery on the Fifth Floor, Market.

This is an exhibition of architectural work—mostly work in the course of architectural study, and of competitive prize drawings.

These drawings come from the American Federation of Arts, the American Academy in Rome, the Society of Beaux Arts Architects, and various Universities, and the exhibition is one of great general interest.

At $10—Misses' and young women's Dalmatian cloth, in flannels cutting to a wide variety of styles

At $10—Misses' and young women's fashionable cloths

It does not require a very broad knowledge of human nature for one to decide, after reading each one of these advertisements, the general characteristics of the typical person that trades at each one of the stores. Even the institutional characteristics of the cities themselves are reflected in the manner of approach.

City Characteristics as Portrayed in Advertisements

For instance, New England's thrifty and educational character is suggested in the Filene's advertisement in the words, "Saving Money is Pleasant even on Class Day and Commencement Dresses." "630 Euclid Avenue" in William Taylor & Son's advertisement is a subtle reminder of the beautiful street which has made Cleveland famous all over the world.

Where else but in Philadelphia would you expect the importations of Camille of Paris and "Radical Changes in Silk Sports Coats" to be in close juxtaposition with "Low Price Dress Lengths?"

What is more characteristic of the Chicago spirit than the statement in the Marshall Field Company advertisement that the "New Wabash Avenue Salesroom for Women's Street Dresses has been open but one week. Yet during that time thousands of women of Chicago have visited this addition."

Good Examples of Advertisements That Are Natural

The formal, conventional announcement of B. Altman & Company is characteristic of Fifth Avenue, New York. The announcement of Saks & Company and Rogers Peet Company breathe the spirit of the "great white

way." All of these advertisements are institutional in reflecting the spirit of the city in which they are located, the group spirit of the particular classes to which the store appeals, the institutional spirit of the store itself, and its attitude toward that portion of the public which it sells.

These ten tests blend into each other, and the fact that each one of these announcements is in harmony with the policy of the store justifies test No. 2—"Is it natural?"

Specific and Timely

Most advertisements that represent good constructive work fail of their complete mission in being equally valuable for competitors by simply changing the name of the advertiser. Each one of these advertisements on the contrary fulfil test No. 3—"Is it specific?" All of them give description and prices, with the exception of Rogers Peet Company, which, however, places due emphasis on the one thing in the advertisement which could not be said of any other concern, and that is "Three Broadway Stores."

Test No. 4—"Is it timely?"—applies with special force to every one of the announcements. The student of advertising can well afford to study each one carefully in order to determine what great value is placed on timeliness by those conspicuously successful advertisers.

The same is true of test No. 5—"Is it pertinent?" Everybody knows that each one of the houses whose advertisements we have reproduced is in business
